RE: West River Dairy Expansion

The Minnesota Pollution Control Agency (MPCA) has approved the Findings of Fact, Conclusions of Law, and Order for a Negative Declaration (FOF) on the need for an Environmental Impact Statement (EIS) on the West River Dairy Expansion (Project). The FOF document concludes that this project does not have the potential for significant environmental effects. The decision for a Negative Declaration completes the state environmental review process under Environmental Quality Board (EQB) rules, Minn. R. ch. 4410. Final governmental decisions on permits or approvals for the project may now be made.

The MPCA appreciates comments submitted on the Environmental Assessment Worksheet (EAW). The comments were considered by MPCA staff during the environmental review process and responses to these comments are provided in the FOF.

Interested parties can review the FOF and the EAW documents at the following locations: the MPCA office in Saint Paul; the Hennepin County Library at 300 Nicollet Mall, Minneapolis; and the Marshall-Lyon County Library at 201 C Street, Marshall, Minnesota. Interested parties can also view the documents on MPCA's website at: https://www.pca.state.mn.us/business-with-us/recently-completed-mpca-reviews. Please contract Charles Peterson, charles.peterson@state.mn.us, if you have issues accessing the documents. Please contact the MPCA's Saint Paul office at 651-757-2098 for copies of these documents.

Sincerely,

Katrina Hapka

STATE OF MINNESOTA
MINNESOTA POLLUTION CONTROL AGENCY

In The Matter Of The Decision On The Need For An Environmental Impact Statement For The Proposed West River Dairy Expansion Project Stevens County, Synnes Township, Minnesota

FINDINGS OF FACT CONCLUSIONS OF LAW AND ORDER

INTRODUCTION

As directed by Minn. Stat. 116D.03 and 116D.04 and pursuant to Minn. ch. 4410, the Minnesota Pollution Control Agency (MPCA) staff prepared and distributed an Environmental Assessment Worksheet (EAW) for the proposed West River Dairy Expansion (Project) in Section 1, Synnes Township, Stevens County. Based on the MPCA staff environmental review, the EAW, comments, and information received during the comment period, and other information in the record of the MPCA, the MPCA hereby makes the following Findings of Fact, Conclusions of Law, and Order.

FINDINGS OF FACT

Project Description

1. Riverview LLP (Proposer) proposes expanding the existing West River Dairy 7,855-cow (10,997 AU) facility (Facility) by adding 11,000 dairy cows (15,400 AU) to the facility in Section 1 of Synnes Township, Stevens County. Cows will be housed in a cross-ventilated, total-confinement, free-stall barn and will use clay-lined basins with impermeable covers to collect and store manure and wastewater. Liquid manure will be land applied as fertilizer on cropland. The Project is in the Pomme de Terre Watershed (HUC 07020002) within the Minnesota River Basin at 52755 280th St, Morris, MN 56267.
2. The application for an MPCA individual National Pollutant Discharge Elimination System (NPDES) permit (Feedlot Permit) was submitted on December 12, 2025.

Procedural History

3. An EAW is a brief document designed to provide the basic facts necessary for the Responsible Governmental Unit (RGU) to determine whether an Environmental Impact Statement (EIS) is required for a proposed project or to initiate the scoping process for an EIS (Minn. R. 4410.0200, subp. 24). The MPCA is the RGU for this Project.
4. Pursuant to Minn. R. 4410.4300, subp. 1, the Project requires the preparation of an EAW because the Minn. R. 4410.4300, subp. 29.A. 1,000 AU animal feedlot threshold is exceeded.
5. The MPCA provided public notice of the Project as follows:
6. The MPCA notified local governmental units and Tribal Nations in counties of interest of receipt of the EAW on March 12, 2024, May 9, 2025, and November 4, 2025.

7. The Environmental Quality Board (EQB) published the Notice of Availability of the EAW for public comment in the EQB Monitor from February 10, 2026, to May 7, 2026.
    - The EAW was available for review on the MPCA website at: https://mpca.commentinput.com/comment/search.
    - The MPCA provided a news release to media in Stevens County, Minnesota on March 10, 2026.
8. The Proposer's coverage under a feedlot permit was open for public comment from February 10, 2026, to May 7, 2026.
    - The MPCA conducted a public meeting on April 28, 2026.
9. Comments from Tribal Nations were sought early and throughout the environmental review process, as follows: early coordination notification were emailed to tribal contacts in counties of interest on March 12, 2024, May 9, 2025, and November 4, 2025. MPCA asked Proposer to contact the State Historic Preservation Office (SHPO), Minnesota Indian Affairs Council (MIAC), and Office of the State Archaeologist (OSA) regarding the project proposal. MPCA emailed the complete EAW packet for public comment period to tribal contacts in counties of interest. MPCA will email the final findings of fact package (FOF package) to tribal contacts in counties of interest.
10. During the comment period on the EAW ending on May 7, 2026, the MPCA received two comments from the Minnesota Department of Natural Resources, and 1,314 community members and 60 comments on the Feedlot Permit during the joint comment period. Only one of the 60 comments on the Feedlot Permit was related to the Feedlot Permit; the remaining 59 were for the EAW. Well after the comment period closed, the MPCA received two additional comments submitted by the Minnesota Center for Environmental Advocacy (MCEA) and the Land Stewardship Program (LSP). Although not a part of the record or MPCA's decision, the MPCA did review the two comments which were similar to other comments made during the comment period, and they do not alter the MPCA's decision to issue a negative declaration.
11. On May 11, 2026, the MPCA requested and received approval from the EQB for a 15-day extension of the decision-making process on the need for an EIS for the Project in accordance with Minn. R. 4400.1700, subp. 2(B).
12. The list of comments received during the public comment period is Appendix A to these Findings. The MPCA prepared written responses to the comments received on the EAW and Feedlot Permit during the public comment period in Appendix B.
13. An Errata Sheet is in Appendix C to these Findings.

The four criteria for determining the potential for significant environmental effects

14. The MPCA shall base its decision on the need for an EIS on the information gathered during the EAW process and the comments received during the comment period. (Minn. Stat. 116D.04, Subd. 2a(d); Minn. R. 4410.1700, subp. 3). The MPCA must order an EIS for projects that have the potential for significant environmental effects (Minn. R. 4410.1700, subp. 1). In deciding whether a Project has the potential for significant environmental effects, the MPCA must compare the impacts that may be reasonably expected to occur from the Project with the criteria set forth in Minn. R. 4410.1700, subp. 7. The four criteria are:
    A. Type, extent, and reversibility of environmental effects;

B. Cumulative potential effects. The RGU shall consider the following factors:

- whether the cumulative potential effect is significant;
- whether the contribution from the Project is significant when viewed in connection with other contributions to the cumulative potential effect;
- the degree to which the Project complies with approved mitigation measures specifically designed to address the cumulative potential effect; and
- the efforts of the Proposer to minimize the contributions from the Project.

A. The extent to which the environmental effects are subject to mitigation by the ongoing public regulatory authority. The RGU may rely only on mitigation measures that are specific and that can be reasonably expected to effectively mitigate the identified environmental impacts of the Project.

B. The extent to which the environmental effects can be anticipated and controlled as a result of other available environmental studies undertaken by public agencies or the Project Proposer, including other EISs.

The MPCA Findings with respect to each of these Criteria

A. Type, extent, and reversibility of environmental effects

15. The first criterion that the MPCA must consider when determining if a project has the potential for significant environmental effects is the "type, extent, and reversibility of environmental effects" (Minn. R. 4410.1700, subp. 7(A)). The MPCA Findings with respect to these criteria are set forth below.

16. A summary of the types of Project impacts the MPCA finds may be reasonably expected to occur from the Project include:

    a. Surface water quality
    b. Groundwater quality
    c. Air quality (hydrogen sulfide, ammonia, odor)
    d. Greenhouse gas emissions

17. Public comments received during the comment period that raised additional issues include:

    e. Groundwater appropriations
    f. Traffic

18. With respect to the extent and reversibility of impacts that are reasonably expected to occur from the Project, the MPCA makes the following Findings:

19. Description of the types of Project impacts the MPCA finds may be reasonably expected to occur:

19.1.1 Surface Water Quality

19.1.2 The EAW outlines construction and operational requirements used to comply with the water quality discharge standards of Minn. R. pt. 7020.2003 and the Feedlot Permit. This includes the requirement to design, construct, operate and maintain the Facility to contain all contaminated runoff and the direct precipitation up to the volume from a 25-year 24-hour storm event. The Project provides 14 months of manure and process wastewater storage (versus nine months required by Minn. R. 7020.2100.)

19.1.3 Minn. R. 7020.2015 and the Feedlot Permit prohibits all animals at an animal feedlot facility from entering waters of the state.

19.1.4 The Project's Nutrient Management Plan (NMP), and the Feedlot Permit include measures and requirements to prevent impacts to surface water and groundwater from land application of manure that are applicable to all manure generated by the Facility. All other manure land applied within the same watershed is subject to similar measures and requirements found in Minn. R. 7020.2225, to prevent impacts from to surface water and groundwater.

19.1.5 Storage structures for liquid manure will meet the design criteria of Minn. R. 7020.2100. Additionally, a professional engineer licensed in Minnesota is required to design and oversee the construction of liquid manure storage structures. The Proposer is required to examine any Liquid Manure Storage Area (LMSA) drain tile outlet monthly for water flow and signs of discoloration or odor in any water in the drain tile, and maintain and monitor a minimum of three feet of freeboard for the Project's LMSAs.

19.1.6 Minn. R. 7020.2225 and the Feedlot Permit require the Proposer to manage all manure following an NMP approved by the MPCA.

19.1.7 The Project's NMP, incorporated by reference into the Feedlot Permit, meets all rule and permit requirements and thus ensures the Proposer (and recipients of manure) will utilize the nutrients properly to protect water quality. The NMP is a planning tool that is used to ensure nutrients are properly utilized and land application of manure methods and practices prevent impacts to waters on a field-by-field basis.

19.1.8 The NMP describes how manure generated by the Project will be applied to meet all rules and regulations and protect surface water and groundwater quality.

19.1.9 The NMP for the Project requires total nutrients (manure and other sources) be applied following the Feedlot Permit and Minn. R. 7020.2225 requirements.

19.1.10 Manure application rates may also be limited when soil phosphorus test results exceed levels listed in Minn. R. 7020.2225 and the Feedlot Permit. Phosphorus management is required in special protection areas when soil phosphorus test results exceed 21 parts per million (ppm) Bray P1 or 16 ppm Olsen. Additional Feedlot Permit restrictions apply to fields testing exceedingly high for soil phosphorus.

19.1.11 Based on typical crop rotations for planned application acres, the number of acres available for the Project are adequate to ensure that the estimated plant-available nitrogen (N) from the manure and process wastewater generated by the Facility does not exceed the expected crop N needs for non-legume crops or the expected N removal for legume crops.

19.1.12 To minimize impacts from surface runoff at the manure application sites, the Proposer must observe setbacks to waters, open tile intakes, sinkholes, mines, quarries, and wells as specified in Minn. R. 7020.2225 and the Feedlot Permit. Where a county also has setback requirements for land application of manure, the Proposer must follow the most restrictive of the state or county setback requirements. Additionally, application of liquid manure is prohibited during the months of December, January, February, and March if winter conditions exist.

19.1.13 The Feedlot Permit requires the transport of manure in a manner to prevent it from leaking or spilling onto public roadways. If manure leakage or spillage occurs, it must be cleaned up and land applied following Minn. R. 7020.2010 and the Feedlot Permit.

19.1.14 The Proposer has identified 16,669 acres of cropland available for manure application. Based upon the approved NMP, this is adequate for land application of the manure at agronomic rates.

19.1.15 The NMP for the Project indicates all manure applications to fields will be injected or incorporated within 24 hours, which further limits potential impacts due to runoff from the land application sites. This also limits the potential for bacterial transport from the manure application sites to waters.

19.1.16 When ownership of manure generated by the Project is transferred to a third-party recipient, the Feedlot Permit requires the Proposer, before or at the time of manure land application, to provide the manure recipient with the most current manure nutrient analysis, a sensitive features map for each field where the transferred manure will be applied, for and a summary of requirements that manure recipients must follow, including protective measures identified in the Permittee's approved nutrient management plan to minimize risk of surface and groundwater contamination from manure applications. The recipient of the manure must ensure the agronomic rates of the crop are not exceeded by the application of nutrients from manure, including contributions from any other source. Manure recipients must follow the NMP of the Proposer, including location and timing restrictions, record keeping, and nitrogen best management practices (BMPs). The manure recipient must also apply manure following required setbacks and other requirements of Minn. R. 7020.2225 and the Feedlot Permit.

19.1.17 All manure recipients must keep records of the quantity and nutrient content of the manure applied as well as the location and rate of application. These records must be provided back to the Proposer within 60-days of application. The Proposer must submit all records annually to the MPCA.

19.1.18 The Proposer must keep records of manure application activities for the six most recent years. The records must include the amount and nutrient content of manure, location where the manure is applied, the rate, timing, and method of application, and nitrogen application best practices.

19.1.19 If a manure spill occurs, the Proposer must comply with the Emergency Response Plan developed as part of the permit application process and incorporated into the Feedlot Permit. Minn. Statute 115.061. The Feedlot Permit requires the Proposer to report manure spills to the MN Duty Officer and requires all responsible parties to take immediate action to stop the discharge and recover the material.

19.1.20 The MPCA does not reasonably expect significant adverse impacts to water quality, however, if they were to occur the Proposer must modify the operation and management of the Project. The MPCA requires modification of the Feedlot Permit coverage for those items found to cause pollution of waters, including modification of the NMP, for impacts from land application, and the impacts to waters would be reversed.

19.1.21 All manure application areas are within the Pomme de Terre River Watershed, and several are adjacent to impaired waters including: Lake Hattie (WID: 75-0200-00), Unnamed Basin (WID: 75-0375-00), Pomme de Terre River (WID: 07020002-501), Muddy Creek (WID:

07020002-511), Dry Wood Creek (WID: 07020002-556), Unnamed Stream (WID: 07020002-551), and Unnamed Stream (WID: 07020002-576).

19.1.22 County Tile 30 outlets into two unnamed creeks (WID 070200002-551 and 07020002-552), which then flows to the Pomme de Terre River (WID 07020002-501), and then eventually to the Minnesota River (WID 070200001-552).

19.1.23 The Federal Clean Water Act (CWA) (33 U.S.C. and 303 (d)) (1972) requires that each state develop a plan to identify and restore a waterbody that is deemed impaired by state regulations. The Environmental Protection Agency (EPA) requires a Total Maximum Daily Load (TMDL) in accordance with the Clean Water Act. A TMDL identifies pollutants causing impairment and how many of those pollutants can enter the waterbody while still meeting water quality standards.

19.1.24 Minnesota's "Final Animal Agriculture Generic Environmental Impact Statement" (2002) and the University of Minnesota Agriculture Extension Program state that manure not only supplies nutrients but can also improve the biological and physical properties of soil, making it more productive and less erosive. Manure provides valuable organic matter to soil that improves soil tilth, aids in the retention of water and nutrients, and promotes growth of beneficial microorganisms. Manure, when properly used as part of a soil management program, improves soil quality, builds soil structure, and increases the level of soil organic matter.

19.1.25 There are no aquatic invasive species or impaired waters within one mile of the Project site.

19.1.26 The Project site is designed to capture and reuse most or all of stormwater runoff, reducing the untreated runoff that currently leaves the property.

19.1.27 The Feedlot Permit incorporates by reference the MPCA Construction Stormwater (CSW) permit and requires a Stormwater Pollution Prevention Plan. Both regulate the collection and management of stormwater.

19.1.28 The Feedlot Permit requires the management, collection, and storage of process wastewater, including stormwater that comes in contact with pollutant sources defined in the permit.

19.1.29 Minn. R. 7020.2225 and the feedlot permit include measures and requirements to prevent impacts to surface waters and "not cause or contribute to non-attainment of applicable state water quality standards"

19.1.30 The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess potential impacts to surface water quality that are reasonably expected to occur from the Project.

19.1.31 The MPCA finds the Project, as proposed, does not have the potential for significant environmental effects based on the type, extent and reversibility of impacts related to surface water quality, which are reasonably expected to occur.

19.2 Groundwater Quality

19.2.1 The Proposer will install an inspection port near the LMSAs to enable monthly visual inspections. After construction, the Proposer will ensure the drain-tile system is functioning correctly for each LMSA and look for signs of discoloration or odor that may indicate an issue with the liner.

19.2.2 The risk of contamination of groundwater quality due to the LMSAs is low due to the engineered concrete structures and clay-lined design for the Project.

19.2.3 LMSAs at the Project site will exceed the required soil seepage standard, and LMSA clay-liner thickness will be increased from two feet to five feet.

19.2.4 The Proposer may encounter shallow groundwater during construction of the LMSAs, so they will install a perimeter drain-tile system at an elevation that is lower than the liner within the LMSA to reduce external groundwater pressure on the walls and to control seasonal subsurface saturation near the LMSAs.

19.2.5 To minimize the potential for nitrate leaching into the groundwater at the manure application sites, the Project is required to follow Minn. R. Ch. 7020 and Feedlot Permit requirements relating to application of nutrients (manure) generated from the Project in combination with other nutrient sources.

19.2.6 Potential sources of N include commercial fertilizer, manure applied during the current crop year, manure applied during the previous crop year, irrigation water, and legumes grown during previous years.

19.2.7 The Project's nutrient management plan describes how manure in combination with other nutrient sources will be applied at agronomic rates. N rates must be limited so that the estimated plant-available nitrogen (N) from all N sources does not exceed the expected crop N needs for non-legume crops or the expected N removal for legume crops.

19.2.8 To further minimize the potential for nitrate leaching into the groundwater, the Feedlot Permit requires the Project implement BMPs. One of the listed BMPs must be followed for land application during warm soil moths of June, July, August, September. Potential BMPs requirements include: application to actively growing crops, planting cover crops, use of a nitrapyrin-based nitrogen stabilizing product, delaying application until soil temperature has reached 50 degrees or less for two consecutive days, crop rotations that include growing perennial crops two years during any five-year period and reduced rate split N applications.

19.2.9 The Proposer will follow the state or county setbacks from ditches, lakes, tile intakes, and wells, whichever is more protective/restrictive, to prevent nutrient runoff into those features.

19.2.10 The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess potential impacts to the groundwater quality that are reasonably expected to occur from the Project.

19.2.11 The MPCA finds the Project, as proposed, does not have the potential for significant environmental effects based on the type, extent and reversibility of impacts related to groundwater quality, which are reasonably expected to occur.

19.3 Air Quality Related to Hydrogen Sulfide Emissions

19.3.1 The Proposer conducted air dispersion modeling to estimate the atmospheric concentrations of hydrogen sulfide. The Proposer's modeling used the American Meteorological Society Regulatory Model (AERMOD) developed by the American Meteorological Society and the U.S. Environmental Protection Agency. The model evaluated the air quality impacts of the Project. AERMOD is a widely accepted air dispersion model, which uses conservative assumptions to predict air quality.

19.3.2 The air modeling predicts the Project will comply with the 30 parts per billion (ppb) hydrogen sulfide Minnesota Ambient Air Quality Standards (MAAQS). Under the hydrogen sulfide MAAQS, the third exceedance of the MAAQS within any 5-day period is a violation. The air modeling demonstrates compliance when the high-third-high hydrogen sulfide concentration (added to background concentration) for any 5-day period at each property-line receptor is below the ambient standard of 30 ppb.

19.3.3 The air modeling predicts the Project emissions alone will result in a maximum property-line hydrogen sulfide concentration of 12.44 ppb. The estimated ambient air concentration for hydrogen sulfide in the Project area is 17 ppb. The total (Project emissions plus existing background) hydrogen sulfide concentration is predicted to be 29.44 ppb at the Project's property lines.

19.3.4 When analyzing Sub-Chronic Inhalation Health Risk Value (iHRV), air modeling predicts the Project will not exceed the 10 micrograms per cubic meter ($\mu g/m^3$) subchronic (13-week) hydrogen sulfide iHRV at neighboring residences. iHRVs are concentrations of chemicals emitted to air that are unlikely to pose a significant risk of harmful effects when humans are exposed to those concentrations over a specified period.

19.3.5 The air modeling predicts the Project emissions alone will result in a maximum monthly hydrogen sulfide concentration of 0.21 $\mu g/m^3$ at the nearest residence. The estimated hydrogen sulfide background concentration in the Project area is 1.0 $\mu g/m^3$. The total Project emissions plus existing background H_2S concentration in the air is predicted to be 1.21 $\mu g/m^3$. Note, while the iHRV is for a 13-week period, AERMOD is not capable of averaging concentrations for that time- period, so a monthly averaging period was used instead. The monthly averaging period is acceptable because it produces a more conservative or protective prediction than the 13-week period.

19.3.6 Odor mitigation measures include: synthetic covers for all but one open air manure storage basins (one basin will be covered with straw – special O&M requirements included in permit), solids separated from the liquid portion of manure eliminating the need to agitate liquid manure storage areas - agitation creates odor and releases emissions, and all liquid manure is pumped through hoses to cropland, injected during application. These measures are included in the Feedlot Permit as either explicit requirements or incorporated by reference from the permit application materials including manure storage area design plans and specifications and the nutrient management plan.

19.3.7 The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess potential impacts to air quality related to hydrogen sulfide emissions that are reasonably expected to occur from the Project.

19.3.8 Based on the air modeling results discussed above, the MPCA finds that potential impacts to air quality related to hydrogen sulfide emissions expected from the Project do not present the potential for significant environmental effects.

19.4 Air Quality Related to Ammonia Emissions

19.4.1 The air modeling predicts the Project will not exceed the 3,200 $\mu g/m^3$ (1-hour) acute ammonia iHRV at the Project's property-line.

19.4.2 The air modeling predicts the Project emissions alone will result in a maximum hourly property-line ammonia concentration of 1861 $\mu g/m^3$. The estimated ammonia background concentration in the Project area is 148 $\mu g/m^3$. The maximum total (Project emissions plus existing background) property-line ammonia concentration is predicted to be 2009 $\mu g/m^3$.

19.4.3 The air modeling predicts the Project will not exceed the 80 $\mu g/m^3$ (1-year) chronic ammonia iHRV at neighboring residences to the Project site.

19.4.4 The air modeling predicts the Project emissions alone will result in a maximum 1-year time averaged ammonia concentration of 9.39 $\mu g/m^3$ at neighboring residences. Air modeling results indicate the Project, and the 15 neighboring feedlots will not create exceedances of the chronic ammonia iHRV at the neighboring residences. When a background ammonia concentration of 5.72 $\mu g/m^3$ is added to the AERMOD concentration, the maximum annual ammonia concentration for a neighboring residence is 15.11 $\mu g/m^3$, which is below the chronic ammonia iHRV of 80 $\mu g/m^3$.

19.4.5 The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess potential impacts to air quality related to ammonia emissions that are reasonably expected to occur from the Project.

19.4.6 Based on the air modeling results discussed above, the MPCA finds that potential impacts to air quality related to ammonia emissions expected from the Project do not present the potential for significant environmental effects.

19.5 Air Quality Related to Odor Emissions

19.5.1 Although Minnesota has not established ambient air quality standards to regulate odor, the Proposer completed air dispersion modeling for odor. Based on the air dispersion modeling analysis, AERMOD modeling results indicate that after construction, the Project will not exceed the odor strength described as "Moderate" at the south property line.

19.5.2 AERMOD calculated the ground-level odor concentrations at the property lines for the Project and at 11 of the Facility's neighboring residences. The maximum hourly odor concentrations along the Facility's property lines were below the "moderate" odor threshold of 244 OU, except for one hourly exceedance along the near-south property line. The maximum odor concentration for the near south property line was 260 OU. The calculated hourly odor concentration at any property-line receptor was less than or equal to the "faint" odor threshold of 83 OU at least 99.67 percent of the time.

19.5.3 The Proposer submitted an air emissions and odor management plan to the MPCA with its Feedlot Permit application. The plan includes measures the Proposer will take to minimize the generation of odors from the Project and associated manure application activities, including synthetic covers over basins in Facilities 101, 102, and 106 to reduce the release of gases and odors from stored manure. The Proposer will use below ground manure storage pits and immediately inject manure into the soil as its manure application method to minimize odors. The Proposer has also taken other measures as listed in EAW item 6.B. to further reduce odors. Per the Feedlot Permit's air emissions plan, if odor complaints are received and validated by the MPCA, the Proposer must implement methods to mitigate odors, and if monitoring indicates exceedances of State H_2S Standard, the Proposer must

plan and implement measures to control emissions. The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess potential impacts to air quality related to odor that are reasonably expected to occur from the Project.

19.5.4 Based on the modeling results discussed above, the MPCA finds that potential impacts to air quality related to odor at the property lines and nearby residences does not present the potential for significant environmental effects.

19.5.5 Summary of Air Quality Impacts

19.5.6 The Proposer conducted air dispersion modeling to estimate the atmospheric concentrations of hydrogen sulfide, ammonia, and the intensity of odorous gases at the Project property lines and nearest neighbors.

19.5.7 The MPCA expects the Project to meet applicable air quality standards and criteria.

19.5.8 With respect to the reversibility of air quality impacts expected to occur from the Project, air emissions from the Project will continue while it remains in operation and would cease only if the Project were temporarily or permanently closed.

19.5.9 If excessive air emissions or violations of the hydrogen sulfide MAAQS were to occur, or if the Project exceeded iHRVs for hydrogen sulfide or ammonia, air quality impacts are likely to be correctable. The MPCA could initiate an investigation and require the Proposer to make operation and maintenance changes. Therefore, the MPCA finds that any impacts on air quality that may occur from the Project are reversible.

19.5.10 The MPCA finds that information presented in the EAW and other information in the environmental review record are adequate to assess the potential impacts on air quality that are reasonably expected to occur because of the Project.

19.5.11 The MPCA finds the Project, as proposed, does not have the potential for significant environmental effects based on the type, extent, and reversibility of impacts on air quality that are reasonably expected to occur from the Project.

19.6 Greenhouse Gas Emissions

19.6.1 The MPCA considered greenhouse gas (GHG) emission sources that are within the scope of the Project.

19.6.2 The Project will directly release GHG emissions, which can widely disperse within the atmosphere, and which vary both in terms of their global warming potential and their persistence in the atmosphere.

19.6.3 To provide a common unit of measure, the MPCA uses the individual global warming potential (GWP 100) of methane and nitrous oxide to convert to carbon dioxide equivalency (CO_2e). GWP 100 is the standard value used in nearly every regulatory and reporting framework, including EPA's GHG inventories. MPCA accepts the use of GWP 100 values.

19.6.4 Using U.S. Environmental Protection Agency (EPA) emission factors found in Table 8A of the EAW, Scope 1 Construction Sources are 1,915 CO_2e tons per year for one year. After construction and during operation of the Project, Source 1 Mobile Equipment Combustion, Scope 1 Stationary Equipment Combustion, Scope 2 Fugitive Emissions, and Scope 2 Off-site Electricity will be approximately 72,210 CO_2e tons per year. CO_2 emitted to the atmosphere

from combustion of biomass, is considered biogenic CO_2 as defined in Table 4 of the Environmental Quality Board's EAW climate guidance and is considered carbon neutral.

Scope	Type of emission	Emission sub-type	Project-related CO_2e emissions (tons/year)	Calculation method(s)
Scope 1	Construction Land use and combustion	Construction Area; stationary; mobile	1,915 Construction One year only	MPCA Guidance
Scope 1	Land use	Conversion	97	MPCA Calculator[1]
Scope 1	Land use	Area enteric fermentation CH_4	47,531	MPCA Calculator
Scope 1	Land use	Area-barn/manure storage CH_4	19,603	MPCA Calculator
Scope 1	Land use	Area-barn/manure storage N_2O	3,988	MPCA Calculator
Scope 1	Land use	Are-barn/manure land application N_2O	5,841	MPCA Calculator
Scope 1	Land use	Carbon sink-alfalfa conversion	-2,662	MPCA Calculator
Scope 1	Combustion	Stationary heaters	126	MPCA Guidance
Scope 1	Combustion	Mobile equipment	1,626	MPCA Guidance
Scope 1	Land use	Area-ammonia replacement	-9,038	Barr Engineering
Scope 2	Electricity	Grid-based	5,098	MPCA Guidance
Total			72,210	

19.6.5 The Project has a net increase of 72,210 CO_2e per year in GHG emissions, primarily from livestock digestion (enteric fermentation), and manure storage. The total net GHG emissions during the life of the Project (approx. 30 years), including the construction and operation phases, is estimated to be 2.17 million tons CO_2e.

19.6.6 There are no MAAQS or National Ambient Air Quality Standards (NAAQS) for GHG emissions.

19.6.7 Currently, there are no federal or Minnesota thresholds of GHG significance for determining the impacts of GHG emissions from an individual project on global climate change.

19.6.8 In the absence of a threshold of GHG significance, the MPCA looks to existing regulation. Minn. R. 4410.4300, subp. 15(B), establishes a mandatory category requiring preparation of an EAW for stationary source facilities generating a combined 100,000 tons per year of GHG emissions after installation of air pollution control equipment. GHGs include carbon

[1] Based on assumptions using the standard weight of a dairy cow in this region.

dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. The purpose of an EAW is to assess environmental effects associated with a proposed project to aid in the determination of whether an EIS is needed. On the premise of greenhouse gas emissions, environmental regulations establish 100,000 tons per year as a trigger to prepare an EAW to aid in determining potential significant environmental effects. A reasonable conclusion is that the Project's GHG emissions below 100,000 tons per year after installation of control equipment are not considered significant.

19.6.9 The MPCA finds that information presented in the EAW and other information in the environmental review record is adequate to assess potential impacts related to GHG emissions that are reasonably expected to from the Project.

19.6.10 The MPCA finds the Project, as proposed, does not have the potential for significant environmental effects based on the type, extent, and reversibility of impacts related to GHG emissions, which are reasonably expected to occur.

20. Categories of written public comment received during the comment period raised additional issues:

20.1 Groundwater appropriations

20.1.1 Commenters expressed concerns about the volume of groundwater the Project will use.

20.1.2 The Project will use an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project.

20.1.3 The APEC/Off-Site Well is an existing well originally constructed for an ethanol plant (APEC) (not constructed) under MN DNR Permit #2008-0230 with an original allocation of 452 million gallons per year (MGY)

20.1.4 The APEC/Off-Site Well is near the Pomme de Terre River valley and is screened in a Quaternary Water Table Aquifer (QWTA), while the wells for the existing facility are screened in the Quaternary Buried Artesian Aquifer (QBAA) beneath the Project site.

20.1.5 The appropriation was established based on the results of a seven-day aquifer pump test that identified sufficient water in the water-table aquifer and confirmed that the aquifer is hydraulically connected to the Pomme De Terre River. As recommended in the Aquifer Test Report, pumping conditions were imposed by the DNR to protect the river in the event of drought or low surface-water flows.

20.1.6 The Proposer has applied for a new water appropriation from the APEC/Off-Site Well for 226 MGY at a proposed maximum pumping rate of 1,000 gallons per minute (gpm) for livestock watering. This original allocation (452 MGY) will be terminated during the permitting process with DNR.

20.1.7 The Proposer consulted with DNR on the use of the APEC/Off-Site Well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230.

20.1.8 DNR is evaluating the proposed use of that well against statutory and rule requirements. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. Conditions would be modified from those currently included with 2008-0230, including restrictions on the ability to appropriate water during summer months.

Additionally, DNR will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site.

20.1.9 Although the on-site wells and the off-site well are screened in different aquifers, DNR's analysis shows that the shallow and deep aquifers in this area are hydraulically connected and function as a single groundwater system with limited water availability. Because of these hydraulic connections, cumulative existing and proposed water appropriations will be evaluated during the DNR's water appropriation permitting process.

20.1.10 The Proposer will develop an alternative contingency plan that differs from the original appropriation.

20.1.11 As a contingency measure for seasonal fluctuations and/or potential pumping restrictions, two water storage basins (Facilities 501 and 502), will be constructed as part of the Project. The basins will be filled with well water outside restricted periods. The water storage basins will also store an average of 90 MGY of collected stormwater per year, reducing reliance on a single water source.

20.1.12 Stormwater will be collected using existing infrastructure, such as stormwater basins, to direct runoff into the water storage basins. Stormwater does not encounter manure or feed storage areas. The process is similar to the required capture of precipitation in stormwater basins; however, instead of releasing the captured water, clean stormwater is used to offset the water pumped for cow consumption.

20.1.13 The Proposer will comply with all DNR pumping restrictions for the APEC/Off-Site Well.

20.1.14 The MPCA finds that information presented in the EAW and other information in the environmental review record is adequate to address the concerns related to groundwater appropriation. The impacts on groundwater that are reasonably expected to occur from the Project have been considered during the review process and methods to prevent significant adverse impacts have been developed.

20.1.15 The MPCA finds that the Project, as it is proposed, does not have the potential for significant environmental effects based on the type, extent, and reversibility of impacts related to groundwater appropriation that are reasonably expected to occur from the Project.

20.2 Traffic

20.2.1 Commenters expressed concern about damage to roadways from construction and operation of the Project.

20.2.2 The Proposer will complete road improvements on 520th Avenue between County Road 8 and the Project site to accommodate increased heavy-traffic use.

20.2.3 The Proposer will develop and utilize an underground manure transfer line. The underground line system transports manure from the Facility to a field, typically in the middle of the field. This is an efficient way to transport manure while reducing the need for heavy equipment. This results in less impact on local infrastructure and a minimized risk of manure spills from overland transport.

20.2.4 The underground manure line connects to a drag hose system via an aboveground valve system. The drag hose system is then utilized to apply manure throughout a field.

20.2.5 Minnesota Department of Transportation data indicates Annual Average Daily Traffic (AADT) near the Project on Stevens County Road 8 is 520 vehicles.

20.2.6 The Proposer estimates the Project would increase current traffic counts by approximately 45 vehicles per day.

20.2.7 Therefore, the traffic on Stevens County Road 8 would increase by up to 8.7%, and the potential for traffic congestion is considered low. No improvements to County Road 8 are considered necessary to accommodate this increase in traffic.

20.2.8 The MPCA finds that information presented in the EAW and other information in the environmental review record is adequate to address the concerns related to traffic. The impacts on roads from traffic that are reasonably expected to occur from the Project have been considered during the review process and methods to prevent significant adverse impacts have been developed.

20.2.9 The MPCA finds that the Project, as it is proposed, does not have the potential for significant environmental effects based on the type, extent, and reversibility of impacts related to traffic that are reasonably expected to occur from the Project.

B. Cumulative potential effects

21. The second criterion that the MPCA must consider when determining if a project has the potential for significant environmental effects is the "cumulative potential effects." In making this determination, the MPCA must consider whether the cumulative potential effect is significant; whether the contribution from the project is significant when viewed in connection with other contributions to the cumulative potential effect; the degree to which the project complies with approved mitigation measures specifically designed to address the cumulative potential effects; and the efforts of the proposer to minimize the contributions from the project. Minn. R. 4410.1700 subp.7(B). The MPCA findings with respect to this criterion are set forth below.

22. The EAW, public comments, and the MPCA follow-up evaluation did not disclose related or anticipated future projects that may interact with this Project in such a way as to result in significant cumulative potential environmental effects.

23. The EAW addressed the following areas for cumulative potential effects for the Project:

- Manure Application
- Groundwater Extraction

23.1 Manure Application

23.1.1 Cumulative potential effects related to manure application were discussed in EAW Item 12.B.5 and 21.c. Findings 19.1 and 19.2 is incorporated herein as part of the MPCA's cumulative potential effects evaluation for water quality impacts from manure application, in that the Nutrient Management Plan through the Feedlot Permit addresses state-regulated allowances for nutrient application customized for each manure application site.

23.1.2 The land use in the region, including the Project site and manure application sites, are primarily row-crop agriculture, which can contribute to non-point source pollution of surface waters.

23.1.3 There are 10 active NPDES permitted Concentrated Animal Feeding Operations (CAFOs) within an impaired water body's sub watershed in the Pomme de Terre River Watershed (2024 MPCA TMDL Report). This includes facilities with over 1,000 Animal Units with nine swine and one dairy operation. Most of these facilities are in the lower Pomme de Terre

River Watershed adjacent to the available manure acres listed in the Project. Impairments within the entire Pomme de Terre River watershed cumulatively affect this lower watershed unit since it receives the effects of all the upstream water.

23.1.4 Proper operation and management of the Project and adherence to appropriate manure land application practices in the MPCA-approved NMPs will prevent the potential of manure and/or manure-contaminated runoff from impacting waters of the state.

23.1.5 The Feedlot Permit includes an Operations and Maintenance (O&M) plan for manure pumping/transfer of manure to application fields, to maintain and monitor pumping/transfer equipment and take action should equipment fail.

23.1.6 Since the Feedlot Permit and NMPs require preventative measures to protect surface water and groundwater quality, the MPCA does not anticipate the Project will contribute to any potential adverse effect on water quality from manure applications. Therefore, the MPCA finds that the Project is not expected to contribute significantly to adverse cumulative potential effects on water quality from manure applications.

23.2 Groundwater Extraction

23.2.1 The Aquifer Test Report (April 2007) includes an assessment of potential impacts to surface-water features, including the historical examination of the Pomme de Terre River flows.

23.2.2 The Aquifer Test Report (April 2007) found the well-water levels measured during the pumping test and the predicted drawdown provide strong evidence that pumping at the proposed appropriation rate would not result in lost wetland acres, functions, or values.

23.2.3 Based on the results of the Aquifer Test Report (April 2007), engineers found the water-table aquifer used by the APEC/Off-Site Well provides ample water and is hydraulically connected to the Pomme de Terre River. River flows need to be considered, therefore, the DNR will evaluate cumulative existing and proposed water appropriations during the DNR's water appropriation process.

23.2.4 As a contingency measure for seasonal fluctuations and/or potential pumping restrictions, two water storage basins (Facilities 501 and 502), will be constructed as part of the Project. The basins will be filled with well water outside restricted periods. The water storage basins will also store an average of 90 MGY of collected stormwater per year, reducing reliance on a single water source.

23.2.5 The MPCA finds the information presented in the EAW and other information in the environmental review record does not demonstrate the Project has the potential for significant environmental effects to groundwater based on significant cumulative potential effects because the Project will comply with a DNR water appropriation permit.

24. Cumulative effects summary

24.1 Based on information on the Project obtained from the Feedlot Permit application processes, information on water quality, information on manure application and groundwater appropriation presented in the EAW, and consideration of potential effects due to related or anticipated future projects, the MPCA does not expect significant cumulative effects from the Project.

24.2 The MPCA finds the Project, as proposed, does not have the potential for significant environmental effects related to cumulative potential effects that are reasonably expected to occur.

C. The extent to which the environmental effects are subject to mitigation by ongoing public regulatory authority

25. The third criterion that the MPCA must consider when determining if a project has the potential for significant environmental effects is "the extent to which the environmental effects are subject to mitigation by ongoing public regulatory authority. The RGU may rely only on mitigation measures that are specific and that can be reasonably expected to effectively mitigate the identified environmental impacts of the project." Minn. R. 4410.1700, subp. 7(C). The MPCA Findings with respect to this criterion are set forth below.

26. The following permits or approvals will be required for the Project.

Permits and approvals

Unit of Government	Permit or approval required
MPCA	Individual NPDES Feedlot Permit
MPCA	Construction Stormwater Permit
Stevens County	Conditional Use Permit
DNR	Groundwater appropriations permit

27. Individual NPDES Feedlot Permit: The MPCA requires the Proposer to obtain a Feedlot Permit for the Project. The Feedlot Permit incorporates construction and operation requirements and includes operating plans that address manure management, emergency response protocols, and odor/air quality management. The attachments will be an enforceable condition of the Feedlot Permit.

28. Construction Stormwater: Construction stormwater requirements are incorporated by reference into the Feedlot Permit. Owners of feedlots not seeking Feedlot Permit coverage are still required to comply with all requirements of the current MPCA construction stormwater general permit but are not required to obtain construction stormwater permit coverage unless the construction will disturb five or more acres.

29. The DNR Water Appropriation Permit: The groundwater source is an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project. The APEC/Off-Site Well is appropriated for the withdrawal of 226 million gallons per year (MGY) for livestock watering as outlined in existing MN DNR Permit #2008-0230. Stormwater collection will account for 90 MGY and site basin storage will account for 157 MGY. The total water available for the Project of 316 MGY. When separated for groundwater only, the Proposer expects to use approximately 226 MGY of groundwater, for a total consumption of approximately 4.52 billion gallons over 20 years.

Water Sources

Source	Well number	Permit #	Amount	Use
APEC/Off-site well	UN # 740629	DNR permit #2008-0230	226 MGY*	Livestock watering

Source	Well number	Permit #	Amount	Use
Stormwater collection/reuse			90 MGY**	Project runoff directed to Water Storage Basins to be used for livestock watering.
Water storage basins (Facilities 501 and 502)		DNR permit #2008-0230	157 MGY^	Contingency water storage if pumping restrictions on APEC/Off-Site Well are required.
Total water available for the Project			316 MGY (226 + 90)	

*Pumping restrictions possible based on river flow (see groundwater items below).
**Average annual estimated Project runoff water available for livestock watering.
^Water storage basins will hold water from both the APEC/Off-Site Well and stormwater runoff for Project livestock watering.

30. Stevens County Conditional Use Permit: The Proposer is required to obtain all required building and conditional use permits required by local units of government to ensure compliance with local ordinances. The conditional use permit will address local zoning, environmental, regulatory, and other requirements that are needed to avoid adverse effects on adjacent land uses.

31. The above-listed permits include general and specific requirements for the mitigation of the environmental effects of the Project. The MPCA finds that the environmental effects of the Project are subject to mitigation, as explained in these Findings and the EAW, by ongoing public regulatory authority.

C. The extent to which environmental effects can be anticipated and controlled as a result of other available environmental studies undertaken by public agencies or the Project Proposer, including other EISs.

32. The fourth criterion that the MPCA must consider is "the extent to which environmental effects can be anticipated and controlled as a result of other available environmental studies undertaken by public agencies or the project proposer, including other EISs," Minn. R. 4410.1700, subp. 7(D). The MPCA Findings with respect to this criterion are set forth below.

33. The MPCA reviewed the following documents as part of the environmental impact analysis for the Project:

- Data presented in the EAW.
- Feedlot permit application, with construction specifications, MMP, and attachments.
- U.S. Government's U.S. Greenhouse Gas Emissions and Sinks: 1990-2022 (2024).
- MPCA's legislative report Greenhouse Gas Emissions in Minnesota: 2005-2022 (2025).
- MPCA's report Greenhouse gas reduction potential of agricultural best management practices (2022).
- The Center for Climate Strategies in Collaboration with Minnesota State Agencies' report.

- Minnesota Climate Strategies and Economic Opportunities (2016).
- Minnesota's "Final Animal Agriculture Generic Environmental Impact Statement" (2002).
- Permits and environmental review of similar projects.
- TMDL recommended Best Management Practices.
- Other documents not listed here.

34. The MPCA also relies on information provided by the Proposer, people commenting on the EAW, staff experience, and other available information obtained by staff.
35. The environmental effects of the Project have been addressed by the design and permit development processes, and by ensuring conformance with regional and local plans. No elements of the Project pose the potential for significant environmental effects that are not addressed or mitigated by the requirements of the permits listed above or in the EAW.
36. Based on this environmental review, previous environmental studies by public agencies or the Proposer, and staff expertise and experience on similar projects, the MPCA finds that the environmental effects of the Project that are reasonably expected to occur can be anticipated and controlled.
37. The MPCA adopts the rationale stated in the attached Response to Comments (Appendix B) as the basis for response to any issues not specifically addressed in these Findings.

CONCLUSIONS OF LAW

38. The MPCA has jurisdiction in determining the need for an EIS for this Project. The EAW, the Feedlot Permit development process, and the evidence in the record are adequate to support a reasoned decision regarding the potential significant environmental effects that are reasonably expected to occur from this Project.

39. The MPCA identified areas for potential significant environmental effects. The Project design and permits ensure the Proposer will take appropriate mitigation measures to address significant effects. The MPCA expects the Project to comply with all environmental rules, regulations, and standards.

40. Based on a comparison of the impacts that are reasonably expected to occur from the Project with the criteria established in Minn. R. 4410.1700, subp. 7, the Project does not have the potential for significant environmental effects.

41. An EIS is not required for the proposed West River Dairy Expansion Project.

Any Findings that might properly be termed conclusions and any conclusions that might properly be termed Findings are hereby adopted as such.

ORDER

The Minnesota Pollution Control Agency determines that there are no potential significant environmental effects reasonably expected to occur from the proposed West River Dairy Feedlot Expansion Project and that there is no need for an Environmental Impact Statement.

IT IS SO ORDERED

Appendix B-1: Responses to comments on the EAW

Comment Group	Comment	Response
1	Commenters are requesting an Environmental Impact Statement (EIS) be completed for the Project.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
2	Commenters are requesting an EIS be completed for the Project due to potential impacts to water quality.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
3	Commenters are requesting an EIS be completed for the Project due to potential impacts to water quantity.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
4	Commenters are requesting an EIS be completed for the Project due to potential impacts to air quality.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
5	Commenters are requesting an EIS be completed for the Project due to the potential impact from greenhouse gas emissions.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700

Comment Group	Comment	Response
		subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
6	Commenters are requesting an EIS be completed for the Project due to potential impacts to land and soil.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
7	Commenters are requesting an EIS be completed for the Project due to potential impacts to wildlife.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
8	Commenters are requesting an EIS be completed for the Project due to potential impacts on local roads.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
9	Commenters are requesting an EIS be completed for the Project due to potential impacts from leaks.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
10	Commenters are requesting an EIS be completed for the Project due to potential impacts on human health.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
11	Commenters are requesting an EIS be completed for the Project due to potential	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments.

Comment Group	Comment	Response
	cumulative impacts from the project and other existing feedlots.	Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
12	Commenters are requesting an EIS be completed for the Project to assess potential impacts to small independent dairy farms.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
13	Commenters are requesting an EIS be completed for the Project to assess potential impacts to the local community.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
14	Commenters are requesting an EIS be completed for the Project to assess potential socio-economic impacts.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
15	Commenters are requesting an EIS be completed for the Project due to the large size/scope of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
16	Commenters note that there have been no EISs completed for an animal feedlot or that when the MPCA has ordered an EIS the project was withdrawn.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
17	Commenters request the MPCA to order an EIS due to a past history of spills at some of Riverview's existing dairies.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
18	Commenters are requesting that the EAW/EIS should be prepared by an independent third party.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
19	Commenters are suggesting several statewide policy changes related to environmental review and regulation of feedlots in Minnesota.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
20	Commenters do not believe an EIS is necessary for the Project.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments.

Comment Group	Comment	Response
		Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
21	Commenter reminds MPCA of the criteria to be used when determining if there is the potential to cause significant environmental effects.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.
22	Commenters note to the MPCA, the space for the Public Meeting was too small to accommodate everyone that planned to attend and that some people were turned away from the meeting.	The MPCA's public meeting was held at a venue near the Project location, to enable more local people to attend and not force people to travel one hour plus to a larger venue.
23	Commenters state all of Riverview's feedlot operations should be included in the cumulative impacts analysis.	Environmental review is limited to the proposed project. Existing facilities, unless a phased action, are exempt from further environmental review. Existing facilities can be included in a cumulative impacts analysis, but information requested is limited to "could be reasonably obtained."
24	Commenters argue the "Environmentally Relevant Area" is vastly undersized and does not include a cumulative climate analysis.	The Environmentally Relevant Area (ERA) can vary depending on the environmental topic of consideration such as groundwater extraction vs. manure application vs. cumulative climate analysis. For some environmental topics the ERA is defined within the EAW form, for others the MPCA decides on what constitutes the ERA but must also take into consideration information that "could be reasonably obtained."
25	Commenter is making a legal argument that the including of Rumensin in the EAW irrelevant and vague.	The inclusion of possible feed additives like Rumensin is a suggestion of possible ways is part of the acceptable response under EAW item 18.B.2 to identifying methods for reducing CO_2e.
26	Commenters argue an EAW is insufficient to provide adequate analysis for a project of this size.	MPCA is obligated to follow the process detailed in Minn. R. 4410. Currently, for feedlots an EAW is what is required. The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.

Comment Group	Comment	Response
27	Commenters request the MPCA do a more thorough environmental review due to the massive size/scope of the Project.	MPCA is following the process detailed in Minn. R. 4410, which MPCA is legally obligated to do.
28	Commenters state there must be a requirement for a socioeconomic review of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
29	Commenters state the MPCA must conduct a full, thorough, industrial scale review of the Project.	MPCA is following the process detailed in the existing Minn. R. 4410, which MPCA is legally obligated to do.
30	Commenters argue there should be an analysis of alternatives in the EAW.	An EAW evaluates "the potential for significant environmental effect" on the Project as proposed. If the MPCA determines there is no potential for significant environmental effects from the Project, then there is no need for an alternatives analysis. If the MPCA determines that there is potential for significant environmental effects from the project, an Environmental Impact Statement (EIS) would then be ordered, and an analysis of alternatives would be included in the EIS.
31	Commenters argue that if Riverview has nothing to hide, they should just do the EIS and prove it.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
32	Comments are related to the existing environmental review process currently being followed by MPCA to review the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
33	Commenters request the MPCA deny the project.	Environmental review is not intended to be an approval or denial for a project. Rather the intent of environmental review is to gather information related to the environmental impacts of the project and determine whether those impacts are significant.
34	Commenters state it is irresponsible of the MPCA to advance permits without a full understanding of groundwater and water-quality risks.	No governmental unit, including the Minnesota Pollution Control Agency (MPCA) and Minnesota Department of Natural Resources (DNR), may issue permits approving the Project until the environmental review process is completed in accordance with Minn. R. 4410.3100, subp. 1. Groundwater: The EAW found that no karst features, exposed bedrock, limited unconsolidated soils, soils developed in bedrock, or sand and sand plain soils are present at the existing facility, manure storage, or manure application sites that would represent elevated groundwater vulnerability. The EAW identifies potential groundwater contamination pathways including seepage from liquid manure storage areas (LMSAs), nutrient leaching from manure application fields, and stormwater contacting

Comment Group	Comment	Response
		manure or feed storage areas before reaching groundwater or surface water. The EAW concludes these potential impacts can be mitigated through existing regulatory requirements and permit conditions, including NPDES permit requirements, the Nutrient Management Plan, concrete and clay-lined manure storage structures, increased clay liner thickness from two to five feet, perimeter drain tile systems surrounding LMSAs, compliance with Minnesota Rule 7020, and manure application restrictions. The Project also identifies more than 3,000 additional acres as contingency acreage for manure application. Water Quality: The EAW identifies several potential pathways for impacts to surface water quality, including nutrient runoff from manure application to fields as well as stormwater runoff from feed and manure storage areas and during construction. The EAW notes heavy rainfall events may increase runoff. To address the risk to surface water quality identified in the EAW, the Proposer is subject to conditions found in the Individual NPDES Feedlot Permit and nutrient management plan requirements, setbacks and buffers from protected waters, nutrient management planning based on agronomic rates, manure injection or incorporation practices, stormwater management infrastructure, covered or engineered manure storage facilities, and a prohibition on direct discharges to waters of the state. Cumulative Effects: The EAW states that cumulative potential effects for feedlot projects are generally associated with overlapping manure application and excessive groundwater withdrawals within the same Environmentally Relevant Area (ERA). The EAW concludes that cumulative impacts to groundwater and surface water can be addressed through compliance with the Individual NPDES Feedlot Permit, DNR water appropriation permit conditions, nutrient management requirements, setbacks, stormwater management practices, engineering controls, and the prohibition on direct discharges from the facility.
35	Commenter requests MPCA to review this permit with extreme caution, it seems these big dairies only wreck our environment.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
36	Commenter requests that the MPCA hold a public meeting regarding the Project.	MPCA held a public meeting for the Project on April 28, 2026, in Morris, MN.
37	Commenter states the MPCA rules do not align with BMP's for synthetic fertilizer and fertilizer/manure application.	The comment is out of scope for the Feedlot permit.

Comment Group	Comment	Response
38	Commenters are inquiring if MPCA has authority to hold permits until Environmental Review is complete.	Minn. S. 116D.04 subp. 6 and Minn. R. 4410.3100 prohibit final decisions on permits and approvals for projects subject to environmental review, until the review is complete.
39	Commenters asserted the proposed Project is being reviewed and permitted under feedlot rules and permit requirements that the EPA has already determined are inadequate to protect water quality. They argued that EPA directed the MPCA to revise its feedlot regulatory program and permits, but those improvements have not yet been implemented. As a result, the Project would proceed under an outdated regulatory framework before the strengthened rules and permit requirements are in place.	Revision of Minnesota Rules Chapter 7020 is at the beginning stages of the rulemaking process and is expected to extend multiple years into the future. The current 7020 rules are still in effect until the rulemaking process is complete. This facility is being permitted as an individual NPDES feedlot permit. As such this facility would be subject to all 7020 general conditions in addition to requirements that are more stringent than the general permit. These include additional requirements for Liquid Manure Storage areas, permanent manure stockpiles, stormwater runoff, feed storage, land application of manure, and Operation/Maintenance (OM) standards.
40	Commenter states, "Enforcing the Air Emission Plan requirement would also align with the Minnesota Environmental Rights Act (MERA). MERA, one of Minnesota's bedrock environmental laws, was passed in 1971 "to create and maintain within the state conditions under which human beings and nature can exist in productive harmony in order that present and future generations may enjoy clean air and water, productive land, and other natural resources with which this state has been endowed." MERA allows Minnesota residents to bring civil actions "against any person, for the protection of the air, water, land, or other natural resources located within the state, whether publicly or privately owned, from pollution, impairment, or destruction." Minnesota	This comment is out of scope of this Environmental Review as it focuses on the Minnesota Environmental Rights Act. As part of the Proposers permit application, the applicant affirmed that they will employ the Air Emissions Plan as described in Minn. Rule 7020.0505 supb4.B (1) and in the application.

Comment Group	Comment	Response
	residents may also challenge “any environmental quality standard, limitation, rule, order, license, stipulation agreement, or permit [as] inadequate to protect the air, water, land, or other natural resources located within the state from pollution, impairment, or destruction.”	
41	Commenters state Riverview packed the house with employees at the public meeting held by the MPCA on April 28, 2026, in Morris.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
42	Commenter requests ongoing monitoring be required for the project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
43	Commenter thanks the MPCA for the EIS! They are trying to get more of them in Wisconsin as well as strong ordinances.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
44	Commenter states that Riverview is exercising an overreach of power and needs to be investigated.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
45	Commenter states, "Administrative rules include any “agency statement of general applicability and future effect” adopted to implement or make specific the law the agency administers. If a state agency wishes to create an administrative rule, it must engage in a rulemaking process that includes notice published in the State Register, a statement of need and reasonableness, opportunity for written and oral public comment, and frequently independent review by an administrative law judge. State agencies are prohibited from enforcing a “policy, guideline, bulletin, criterion, manual, standard, or similar	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	pronouncement" as though it were a duly adopted rule. To separate lawful guidance documents from unpromulgated rules, Minnesota courts examine whether agency documents offer an "interpretation of a rule [that] corresponds with its plain meaning."	
46	Commenter notes, all the previous operations previously determined to need an EIS were significantly smaller than West River's proposed operation.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
47	Commenters request that sustainable practices such as no-till, and cover crops be required.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
48	Commenters note there is an expectation and responsibility of the MPCA to protect Minnesota's people and environment.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
49	Commenter requests the EPA do an in-depth examination before MPCA decides on whether to issue a permit.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
50	Commenter states the EAW is merely assurance by the proposer that all is well.	While much of the information in the EAW is obtained from the Proposer, the content and accuracy of the EAW is the responsibility of the Responsible Governmental Unit (RGU) per Minn. R. 4410.1400 A, "The RGU shall be responsible for the completeness and accuracy of all information." For the West River Dairy EAW, the MPCA is the RGU as designated by Minn. R. 4410.4300 Subp. 29. Minn. R. 4410.1000 Subp.1 states "The EAW serves primarily to: A. aid in the determination of whether an EIS is needed for a proposed project; and B. serve as a basis to begin the scoping process for an EIS."
51	Commenter suggests the MPCA is not giving the Project legitimate approval, betraying the trust of the public and weakening Minnesota.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
52	Commenter alleges the Minnesota River Basin is currently overrun with manure from CAFO's and that the MPCA continues to permit them.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
53	Commenter states if the MPCA fails to do a thorough study, it will expose a history of mismanaged environmental review by the MPCA.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
54	Commenter states, "The thousands of documented pleas the MPCA has received from Minnesota residents to honor entitled protections under MEPA may finally command the attention they have always deserved."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
55	Commenter states, "MPCA must enforce policy that protects our planet and people. "Only when the last tree has been cut down, the last fish caught, and the last stream poisoned, will you realize you cannot eat money."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
56	Commenter requests the MPCA look into the opposition that Riverview has received in other states.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
57	Commenter states, "I can't believe that the policy of the state of Minnesota is going to permit the largest feedlot expansion in a single geographic area without more fully exploring the already existing environmental condition of the area."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
58	Commenter states, "Not requiring one [an EIS] makes a mockery of all that has been done previously to protect our land and water resources from degradation."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
59	Commenter states Riverview should be ethically reviewed for their proposed actions.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
60	Commenter states that Minnesota has been spotty enforcing existing environmental laws.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
61	Commenter wants to know what will be done to ensure that Riverview will follow the requirements of their permit.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. The MPCA is the regulatory governmental unit for NPDES general permitted facilities. NPDES general permitted facilities are inspected on a regular basis by MPCA feedlot staff based on resources available. Typically, NPDES general permitted facilities are inspected once every five years, more frequently if appropriate based on inspection results, activities taking place at the feedlot site (i.e. construction), or complaints received. NPDES general permitted feedlot facilities are also required to submit annual reports to the MPCA regarding their feedlot operations and manure applications. These annual reports also serve as means of monitoring NPDES general permitted facilities.
62	Commenter requests Minnesota require Riverview to ship their manure to other states.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
63	Commenter claims MPCA cannot issue the Individual NPDES Permit to West River Dairy because it fails to address GHG Emissions.	Currently, there are no federal or Minnesota thresholds of greenhouse Gas significance for determining the impacts of Greenhouse Gas emissions from an individual project on global climate change. There are also no Minnesota or National Ambient Air Quality Standards (NAAQS) for Greenhouse Gas emissions. The Project Proposers application materials and information provided in the EAW included measures that the Project Proposer implements to reduce GHG emissions from the site. MPCA staff reviewed the Project application materials and found them to meet Minn. R. Ch. 7020 requirements and NPDES Permit requirements.
64	Commenter claims, "Exempting Riverview From Addressing GHG Emissions Based On MPCA's Air Emissions Plan Template Would Reflect Unlawful And Unpromulgated Rulemaking."	The comment is out of scope for the Feedlot permit.
65	Commenter notes, nationally permitting and inspection rates of CAFOs are inconsistent and declining.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. The MPCA is the regulatory governmental unit for NPDES general permitted facilities. NPDES general permitted facilities are inspected on a regular basis by MPCA feedlot staff based on resources

Comment Group	Comment	Response
		available. Typically, NPDES general permitted facilities are inspected once every five years, more frequently if appropriate based on inspection results, activities taking place at the feedlot site (i.e. construction), or complaints received. NPDES general permitted feedlot facilities are also required to submit annual reports to the MPCA regarding their feedlot operations and manure applications. These annual reports also serve as means of monitoring NPDES general permitted facilities.
66	Commenter states, "State preemption laws in many jurisdictions block local governments from imposing stricter standards than the state minimum, creating what researchers call "regulatory vacuums" that leave communities with no meaningful recourse. [Moran, 2022]"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. This comment is out of scope for the Feedlot Permit.
67	Commenter states, "Minnesota has never permitted a facility of this scale. It has no track record with a livestock operation of 26,397 animal units, no established monitoring infrastructure calibrated to impacts of this magnitude, no regulatory precedent for enforcing against a facility that dwarfs anything that has come before. The Environmental Impact Study is not just about understanding the facility's environmental impacts it is about determining whether Minnesota's regulatory framework is even equipped to manage them, and what additional protections would be required before a permit could be responsibly granted."	The MPCA is the regulatory governmental unit for NPDES general permitted facilities. NPDES general permitted facilities are inspected on a regular basis by MPCA feedlot staff based on resources available. Typically, NPDES general permitted facilities are inspected once every five years, more frequently if appropriate based on inspection results, activities taking place at the feedlot site (i.e. construction), or complaints received. NPDES general permitted feedlot facilities are also required to submit annual reports to the MPCA regarding their feedlot operations and manure applications. These annual reports also serve as means of monitoring NPDES general permitted facilities.
68	Commenter requests the MPCA, "Ensure that manure management plans account for extreme weather events and long-term soil nutrient loading."	Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. The Nutrient Management Plan addresses the timing of manure application and sets forth requirements and best management practices for application, including not incorporating manure within 24 hours of any 1/2 inch or greater rainfall event.

Comment Group	Comment	Response
69	Commenter requests the MPCA, "Provide meaningful opportunities for public participation and community input before any final approval."	MPCA held a public comment period from February 10 - May 7, 2026. In addition, a public meeting was held on April 28, 2026, in Morris.
70	Commenter appreciates and respects the process of getting these permits.	Comment noted.
71	Commenter notes, " If a project would house 1,000 or more animal units, a feedlot applicant may apply for an independent SDS permit, or it may apply for a federal NPDES permit that incorporates Minnesota's SDS permit requirements." and "the proposed rule requires owners having 1,000 animal units or more to develop and implement an Air Emission Plan (part 7020.0505, subp. 4, item B, subitem 1.)"	Comment noted. It should also be noted that neither NPDES Permits nor SDS Permits contain restrictions/thresholds relating to the maximum number of animal units that a feedlot facility can be permitted for.
72	Comments concerned about animal disease because of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
73	Commenters expressed concern about health of the animals.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
74	Commenters expressed concern about animal welfare related to the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
75	Commenters are concerned about blue-green algae (cyanobacteria) blooms in the summer months.	Blue-green algae blooms can be toxic. The blooms are associated with excess nutrients, typically phosphorus, in the affected water body. The excess nutrients are generally attributed to agriculture runoff from cropland; however, this is not the only source. The Project will have an MPCA approved nutrient management plan that addresses phosphorus application rates in certain circumstances where there is elevated risk of phosphorous moving off the landscape into the water.
76	Commenters are concerned about the impact to wildlife and wildlife habitat by the Project.	No existing wildlife habitat will be converted to cropland and only cropland will be converted for the expansion building site by the Project. The main impact to wildlife is impacts to the wildlife habitat. Wildlife habitat can be impacted runoff of agricultural land. The building site must collect and control all stormwater runoff from the site. Additionally, the Project has an MPCA approved nutrient management plan that includes restrictions intended to limit the impact of runoff from cropland receiving manure from impacting existing wildlife habitat.

Comment Group	Comment	Response
77	Commenters are concerned about how mortalities at the Project will be handled.	The Project is required to have an approved mortality management plan as part of the Feedlot Permit. The mortality management plan must be in compliance with applicable MPCA and Board of Animal Health regulations.
78	Commenters are concerned about how disposal of carcasses if there is a mass mortality event.	The Proposer is required to follow applicable MPCA and Board of Animal Health regulations when handling carcasses from a mass mortality event. Proposer is required to notify the Minnesota Duty Officer if such an event were to happen. The Minnesota Duty Officer will in turn notify all appropriate agencies to respond, including the MPCA and Board of Animal Health.
79	Commenter is concerned about oversight of the non-milk producing calves.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. The Comment is also beyond the scope of applicable feedlot regulations (U.S.C. 1251, 40 CFR pts. 52, 122, 123, 127, 412, Minn. Stat. Ch. 115 and 116, Minn. R. Ch. 7001, 7009, 7020, 7053, 7060, and 7090), and Individual NPDES Feedlot Permit requirements the Project is required to meet. The Proposer does not raise calves at the project location.
80	Commenters are concerned about the cumulative impact on air quality from the Project.	Air modeling was completed for the Project which included all feedlots within a 3-mile by 3-mile modeling domain. All feedlots greater than 50 animal units within the modeling domain are included in the modeling exercise. Additionally, background values are included in the modeling exercise. Background values are calculated from monitoring data collected in Minnesota. All residences within the modeling domain are modeled as discrete receptors and predicted modeling results at each discrete receptor are included in the Air Quality Modeling Report. Air modeling for feedlots includes hydrogen sulfide, ammonia, and odor.
81	Commenters are concerned about the Project's impact on air quality.	Air modeling was completed for the Project which included all feedlots within a 3-mile by 3-mile modeling domain. All feedlots greater than 50 animal units within the modeling domain are included in the modeling exercise. Additionally, background values are included in the modeling exercise. Background values are calculated from monitoring data collected in Minnesota. Air modeling for feedlots includes hydrogen sulfide, ammonia, and odor. The maximum predicted property hydrogen sulfide concentration is 29.44 parts per billion which is below the ambient standards. The maximum property line ammonia concentration is 2,009 µg/m3 which is below the acute inhalation Health Risk Value (iHRV). Total calculated greenhouse gas emissions from the Project are 72,210 tons/year.
82	Commenter is concerned about how the Project will keep the air clean and fresh for the neighbors.	The Proposer is subject to all permit requirements, including Minnesota Individual Feedlot Permit (attachment 22) which requires an Air Emission Plan that includes methods to mitigate odors and a Manure Management Plan (attachment 23).

Comment Group	Comment	Response
83	Commenters are concerned about the impacts of odor generated the Project.	The maximum hourly odor concentrations along the Facility's property lines were below the "moderate" odor threshold of 244 OU, except for one hourly exceedance along the near-south property line. The maximum odor concentration for the near south property line was 260 OU. The calculated hourly odor concentration at any property-line receptor was less than or equal to the "faint" odor threshold of 83 OU at least 99.67 percent of the time.
84	Commenters are concerned about the health effects from the methane emissions from the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
85	Commenters are concerned about the health effects from the hydrogen sulfide emissions from the Project.	The Project was modeled for hydrogen sulfide emissions. Modeling was used to evaluate the emissions related to the Minnesota Department of Health's (MDH) - inhalation Health Risk Values (iHRV). The modeled predictions at nearest neighboring residences did not exceed the sub-chronic iHRV.
86	Commenters are concerned about the health effects from the ammonia emissions from the Project.	The Project was modeled for ammonia emissions. Modeling was used to evaluate emissions related to the MDHs - iHRVs. The modeled predictions at the property line and nearest residences did not exceed the Acute iHRV. The modeled predictions at the nearest neighbors did not exceed the Chronic iHRV.
87	Commenters are concerned about the health effects from the particulate matter emissions from the Project.	While dairies do produce particulate matter emissions, they are not considered to be a problem at sites with total confinement barns as is proposed by the Project. Past modeling for particulate emissions at feedlots did not show violations of the particulate matter standards.
88	Commenters are concerned about the health effects from the air emissions from the Project.	The Project was modeled for the two primary hazardous air pollutant emissions from feedlots, hydrogen sulfide and ammonia. Modeling results were compared against the iHRVs. Modeled results did not exceed the iHRVs.
89	Commenter notes that the Air Emissions Plan does not commit the company to employing any of the identified odor mitigation measures.	The Proposer is subject to all requirements within the Air Emission Plan.
90	Commenter refers to the methods for controlling hydrogen sulfide emissions in the Air Emission Plan.	Hydrogen sulfide emissions from feedlots have been identified an issue of concern. MPCA has done enforcement on several feedlots in the past for violating Minnesota's Ambient Air Quality Standard for hydrogen sulfide. Common to all those cases was the existence of an uncovered manure storage basin or pit. Putting an impermeable cover on the basins or pits has shown to be the most effective method of controlling hydrogen sulfide emissions. The Proposer has impermeable covers on most of its manure storage basins and straw covers on the remaining basins. The straw covers are typically on smaller settling basins prior to the liquid portion going into the larger covered basins.

Comment Group	Comment	Response
91	Commenter notes, "The Air Emission Plan does not incorporate, attach, or reference the GHG mitigation measures identified in this project's EAW. As a result, neither Riverview's permit application, nor the resulting draft permit, contains any discussion of "methods and practices that will be used to minimize air emissions" associated with the facility's projected 72,210 tons of annual CO_2e emissions."	The focus of air emissions from feedlots are on H2S and odor, with ammonia also included in the air modeling that was conducted for this EAW. MPCA staff reviewed the Project application materials and found them to meet Minn. R. ch. 7020 requirements and NPDES Permit requirements. The Proposer will implement measures to minimize methane production produced by enteric fermentation through dietary manipulation. Additionally, separating the manure solids from the liquid portion of the manure will reduce methane produced from anaerobic digestion occurring in the liquid manure storage basins. There are no state or federal thresholds for greenhouse gases. Additionally, through the EAW process the MPCA found the Project, as proposed, does not have the potential for significant environmental effects based on the type, extent, and reversibility of impacts related to emissions of Greenhouse Gas emissions, which are reasonably expected to occur.
92	Commenter states, "If MPCA's template form is used to demonstrate compliance with Minnesota Rule 7020.0505, subp. 4(B)(1), the agency would be enforcing an unpromulgated rule. First, the form contradicts the Feedlot Rules' plain meaning by wrongly restricting the Rules' scope. Subpart 4 of Minnesota Rule 7020.0505 requires an Air Emission Plan that addresses "emissions resulting from animal feedlot or manure storage area operations." Those emissions include GHGs. By interpreting the rule to omit GHG emissions, contrary to the rule's plain text, MPCA's form falls outside the bounds of lawful interpretation."	There are no federal or Minnesota thresholds of greenhouse gas significance for enforcing greenhouse gas emissions from an individual project on global climate change.
93	Commenter states, "Absent complaints or exceedances, the template form does not require feedlot applicants to commit to any air emission reduction strategies. This approach is inconsistent with the Feedlot Rules' directive to describe emission reduction measures that 'will be used'."	Currently, there are no federal or Minnesota thresholds of greenhouse gas significance for determining the impacts of greenhouse gas emissions from an individual project on global climate change. There are also no Minnesota or National Ambient Air Quality Standards (NAAQS) for greenhouse gas emissions. The Project Proposers application materials and information provided in the EAW included measures that the Project Proposer implements to reduce GHG emissions from the site. MPCA staff reviewed the Project application materials and found them to meet Minn. R. Ch. 7020 requirements and NPDES Permit requirements. Additionally, through the EAW process the MPCA found the Project, as proposed, does not have the potential for significant environmental

Comment Group	Comment	Response
		effects based on the type, extent, and reversibility of impacts related to emissions of greenhouse gas emissions, which are reasonably expected to occur.
94	Commenter wants to know, "Where does all that methane end up?"	Methane emissions are released into the atmosphere. Calculated methane emissions as a result of enteric fermentation and barn and manure storage from the 11,000 animals is 2,397 tons/year. Emissions from stockpiled manure, such as methane can be released into the atmosphere. Manure processed through the anaerobic digester produces renewable natural gas.
95	Commenter states that, "questionable track record of West River Dairy in other states, the environmental & social impacts of the air pollution must be considered."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
96	Commenter asks how far the wind will carry the feed dust generated at the facility?	Dry feedstuffs for the cattle will be stored inside a commodity shed, reducing dust from fine particles. Feedstuffs that are stored outside are forages, which are high in moisture content and are unlikely to create dust. Additionally, covers placed over the forage piles help prevent dust. Most feed-mixing will occur inside a building.
97	Commenter is concerned about dust from township and county roads.	The item 17.C in the EAW addresses dust control within the proposed project area, and mitigation strategies and control measures. Dust emissions will be monitored to ensure they do not exceed 20% opacity and are not visible beyond the property lines. The Project will pave traffic area on the Project site with asphalt or concrete. Non-traffic areas will be planted with grass to control dust and erosion. Dry feedstuffs for the cattle will be stored inside a commodity shed, reducing dust while most feed-mixing will occur inside.
98	Commenters are concerned that the EAW does not evaluate the cumulative GHG Emissions.	Climate change because of greenhouse gas emissions is a well-documented existing cumulative impact occurring on a global scale. Due to the global nature of climate change, it is impossible to establish a reasonable Environmentally Relevant Area from which to calculate cumulative GHG emissions. The design of the Project takes into consideration increased precipitation in the design of its stormwater controls and manure storage structure. The Proposer will implement measures to minimize methane production produced by enteric fermentation through dietary manipulation. Additionally, separating the manure solids from the liquid portion of the manure will reduce methane produced from anaerobic digestion occurring in the liquid manure storage basins. There are no state or federal thresholds for greenhouse gases.
99	Commenters state that the GHG calculation should also include the existing cows at the site.	The existing cows have been at the existing facility for more than three years and therefore are exempt from environmental review (Minn. R. 4410.4300, Subp. 1). GHG calculations for the existing facility are in Appendix C – EAW Errata.
100	Comments are related to increasing extreme weather events.	Several practices are required by the Feedlot Permit to prevent runoff, including manure application requirements and restrictions based on application timing and predicated rainfall events and

Comment Group	Comment	Response
		sensitive features in or near where manure application is planned. Additionally, the design for the proposed LMSA at the site includes additional freeboard capacity should an extreme rain event occur.
101	Commenter states that a marginal change in emission rates will translate into a substantial increase in emissions over time.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
102	Commenter states, "The MPCA must ensure that nutrient management plans are not only technically sufficient on paper but enforceable and resilient in practice and that they align with the state's climate goals, specifically: initiative 2.3.2, manage fertilizer and manure to reduce emissions; and 2.4.1 manage agricultural landscapes to minimize nitrogen runoff and pollution. The proposed mitigations for manure management, which include applying manure fertilizer on fields that are in operation and considering rates of application, still introduce increased manure and therefore N_2O into the soil, water, and atmosphere."	Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state.
103	Commenters note that the project will increase GHG Emissions and thereby contribute to climate change.	Using the latest emissions and approved GHG calculator it is estimated that the Project will contribute 72,210 tons per year of CO_2e.
104	Commenters contend that the GHG calculations are likely underestimated or uncertain.	MPCA's calculator provides a reasonable, standardized representation of the project's likely emissions related to enteric fermentation and manure management. Since its development, the MPCA Feedlot tool has been the standard tool for feedlots when calculating GHG emissions.
105	Commenter notes that, "Riverview's EAW acknowledges that ongoing climate change is expected to increase average annual temperatures."	Comment noted.
106	Commenter states, "We need to fight climate change in all ways, including in our food production systems."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
107	Commenter states, "You are correct, our climate is counting on us."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
108	Commenter states, "Another problem with the EAW is that it relies only on a 100-year global warming potential (GWP100) value. Even though under GWP100, methane is converted to CO_2e emissions using a factor of 28 (meaning 1 ton of methane is treated as having the same warming impact as 28 tons of CO_2 over a 100-year period), this approach can still obscure the near-term climate impacts of the Expansion Project's emissions. Given that methane is a short-lived but highly potent GHG, the analysis should also present emissions using a 20-year global warming potential (GWP20), which better reflects the Expansion Project's 30-year operational lifetime and the acute warming effects of methane during that period. "	GWP 100 is the standard value used in nearly every regulatory and reporting framework, including EPA's GHG inventories. MPCA accepts the use of GWP 100 values.
109	Commenter contends the EAW omits scope 3 emissions from the GHG calculations and is ignoring at least half of the Project's true GHG emissions.	The GHG emissions included in the EAW have been properly scoped. The downstream emissions are classified as scope 1 because the land where alfalfa and manure are applied are under the control of Riverview Dairy.
110	Commenter states, "the EAW does not quantify the total annual GHG emissions generated from feed production but does quantify a specific reduction (or carbon sink credit) related to growing feed".	The EAW cannot assume feed production would not occur even without the expansion project.
111	Commenter states, "the upstream reduction from avoided synthetic fertilizer manufacturing (-9,038 tons) and the carbon sink credit for converting land to alfalfa feed (-2,662 tons) are both included in the	Land utilized for manure application and alfalfa growth are under the operation of the Proposer and thus properly identified as scope 1.

Comment Group	Comment	Response
	total as scope 1 adjustments. Such misleading and erroneous calculation methods result in significant asymmetry."	
112	Commenter notes, "Fully assessing the GHG emissions of the Expansion Project is especially important because the agriculture sector is the second largest source of GHG emissions in Minnesota, responsible for approximately 25% of the State's net emissions. "	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
113	Commenter contends the EAW should include a full lifecycle GHG emissions analysis.	The calculation methodologies used to determine the GHG emissions are based on vetted tools, emission factors, and methodologies. The purpose of EAW item 18 is not to conduct a lifecycle analysis, but to quantify the emissions that the Project proposer has control over. Only emissions that are directly under the proposers' control are included.
114	Commenter argues the mitigation strategies in the EAW are inadequate.	The quantification of two strategies in EAW item 18.B.2 plus the additional unquantified options satisfies the EAW prompt.
115	Commenter argues that a number of alternatives to those proposed were not considered as mitigation strategies to GHG emissions.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
116	Commenter questions the use of cropland conversion to alfalfa as a mitigation strategy and its inclusion as Scope 1.	MPCA's calculator provides a reasonable, standardized representation of the Project's likely emissions related to enteric fermentation and manure management. Since its development, the MPCA Feedlot tool has been the standard tool for feedlots when calculating GHG emissions. Land utilized for manure applications and alfalfa growth are under the operation of the Proposer and thus are properly identified as scope 1.
117	Comment questions the methodologies used to determine GHG reductions based on ammonia replacement by manure.	The calculation methodologies used to determine the GHG emissions are based on vetted tools, emission factors, and methodologies.
118	Commenter notes, "The EAW fails to provide any research on potential emissions reductions from the crossbred Holstein-Jersey cows that will be used in the Expansion Project."	The quantification of two strategies in EAW item 18.B.2 plus the additional unquantified options satisfies the requirements of the EAW.

Comment Group	Comment	Response
119	Comment states that even though manure can replace the use of synthetic fertilizer, it also increases the risk of nitrous oxide emissions from soils under specific conditions.	Manure application rates shall be controlled so the estimated nitrogen available to crops from all nitrogen sources (including commercial fertilizer) does not exceed expected annual crop nitrogen needs for non-legumes and expected nitrogen removal for legumes based on the most recent recommendations of the MES and the MPCA fact sheets "Manure Nitrogen Rates For Corn Production (wq-f8-18)" and "Manure Management For Corn On Irrigated Sandy Soils (wq-f8-52)". Manure application will also be restricted based on time of year, BMP use, perennial crop use, groundwater vulnerability, winter conditions, as well as other restrictions required by the NPDES permit and nutrient management plan to reduce nitrogen runoff or groundwater contamination.
120	Comments are related to Minnesota's climate goals and how the Project does not support those goals.	The quantification of two strategies in EAW item 18.B.2 plus the additional unquantified options addresses how the Project supports the Minnesota Next Generation Energy Act goals.
121	Commenter would like to know the impact to the public more than doubled truck traffic from CO_2 emissions.	Vehicle emissions will account for 1,626 tons/year of CO_2.
122	Commenter is concerned that the warmer temperatures in February and March will result in loss of all the manure nitrogen unless treated with a nitrogen stabilizer.	The Proposer shall comply with all permit requirements of land application of manure.
123	Commenters want to know if the dairy has sufficiently accounted for extreme precipitation events?	The stormwater basins are sized more than 20% larger than the minimum requirement. Each stormwater basin will have a maintenance plan as part of the Storm Water Pollution Prevent Plan (SWPPP).
124	Commenter wants to know if there was a reported manure overflow from the pit when Morris was hit with 16 inches of rain?	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
125	Commenters are concerned about increased likelihood of overflows from the manure storage basins due to increased frequency of extreme weather events.	The design for the proposed LMSA at the site includes additional freeboard capacity should an extreme rain event occur. Additionally, the LMSAs will have a synthetic cover, which will allow West River Dairy to remove stormwater from those basins without manure contamination and preserve available liquid manure storage capacity.
126	Commenter states the emissions from additional vehicle traffic were not included in the GHG emissions.	Vehicle emissions from construction equipment (1,915 tons/year) and additional Ag equipment (1,626 tons/year) have been accounted for within the EAW in attachment 21.

Comment Group	Comment	Response
127	Commenter states that GHG emissions associated with the moving and application of manure were not included in the EAW.	Vehicle emissions from additional Ag equipment (1,626 tons/year) have been accounted for within the EAW in attachment 21. Liquid manure is pumped through pipelines.
128	Commenter notes, "The project is not proposed for a pristine, isolated island, it will be situated in an already degraded environment, part of which is caused by the existing feedlot that is being expanded. And degradation by the landscape having been converted to agriculture is evidence of past effects. If the air and water in the vicinity are not clean and the native ecosystems are not fully functioning, this project's impacts must be added to these "past and present" actions and then added to the impacts of reasonably foreseeable actions."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
129	Commenters are suggesting that alternatives to the Project as proposed be considered.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
130	Commenter is concerned about concentrating all the nutrients in mass storage in one location.	Liquid Manure Storage Areas (LMSA) and Dry Manure Storage are the locations where manure is stored on the feedlot facility site. The individual NPDES feedlot Permit and manure management plan incorporates manure storage, transfer, and land application requirements that exceed those in the NPDES General Feedlot Permit, including 5 feet of compacted clay liner of LMSAs, synthetic covers and installation of a perimeter drain-tile system will be at an elevation below the liner of each of the three LMSAs to control seasonal sub-surface saturation, and operation and monitoring and reporting requirements pertaining to freeboard of the LMSA. Manure from cattle in the free-stall barn will be collected twice daily using a self-propelled vacuum wagon. Solid manure will be stored on a concrete pad. Solid and liquid manure transferred to area farmers for use as fertilizer will be applied in accordance with Feedlot Permit requirements. The Proposer will install stormwater basins and modify the contour of the site to direct stormwater to stormwater basins.
131	Commenters are concerned about the impact of consolidating this amount of livestock in one place.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
132	Commenters do not believe one person or company should have this many animals in one place.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
133	Commenters believe the scale of the Project is too large.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
134	Commenters state that the Project is twice as big as any current operations in the state, and its environmental harm would be enormous.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
135	Commenters are concerned about the creation of biohazards at the Project.	The cows will be housed in a cross-ventilated, total-confinement, free-stall barn with clay-lined basins with impermeable covers to collect and store manure and wastewater. Any contaminated stormwater runoff will not leave the Project site. The Proposer will use onsite earthen materials (clay) to construct manure storage facilities, stormwater basins, and water storage basins. The updated Feedlot Permit incorporates manure storage guidelines through the NPDES General Feedlot Permit, which prevents surface and groundwater pollution. Manure will be land applied at agronomic rates in accordance with Minn. R.7020 and the Feedlot Permit. For acreage converting from commercial fertilizer to manure from the Project, there will be more oversight and regulation of nutrient application than currently exists. The American Meteorological Society/ Environmental Protection Agency Regulatory Model (AERMOD) that was conducted for this Project found that it will not create exceedances of the Minnesota Ambient Air Quality Standard or Sub-chronic Inhalation Health Risk Value (iHRV) for Hydrogen Sulfide (H_2S). AERMOD also predicted that the Project would not create exceedances of the Acute or Chronic iHRV for Ammonia (NH_3). The air modeling was conducted and the permit applied for to ensure that human health and the environment are protected from the activities of the Project.
136	Commenters are concerned the EAW did not consider the cumulative impacts of other feedlots in the area, watershed, geographic area.	The EAW did consider the cumulative impacts of other feedlots in the area where it was reasonable to do so at a scale that is appropriate.
137	Commenters are suggesting how the MPCA should do its job in relation to the decision on the need for an EIS for the Project.	The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.

Comment Group	Comment	Response
138	Commenter suggests, "Landscaping with trees, shrubs, pollinator friendly plants near constructed ponds could provide aesthetic mitigation for the adverse effects of the enormous built infrastructure proposed in this project while providing a modicum of natural habitat for birds, insects and many other forms of important wildlife. As described above, this entire region has had its wildlife populations of all kinds, decimated by loss of these types of habitats."	MPCA will forward suggestions on to Proposer.
139	Commenter stated, "The most meaningful objections concerned the statement made by former MPCA staff that the existing regulations are not strict enough to protect the environment."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
140	Commenter complains about the amount of flies.	Existing activities will help to minimize pests such as flies which include covering liquid manure storage areas with impermeable synthetic covers, and other activities as laid out in the Air Emissions Plan (attachment 22). The Proposer also actively employs good-housekeeping practices, such as frequent collection of manure and prompt clean-up of any spilled feed and removal of manure, spilled water, and water will be collected with a vacuum truck in the scrape alleys which can help to minimize fly breading grounds. These practices reduce the presence of flies. Animal housing at the project will be a "cross-ventilated" barn. This style of ventilation is known for maintaining a steady breeze through the barn, which is great for animal comfort, and it also effectively reduces the presence of flies.
141	Commenter is concerned about the recent flooding.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
142	Commenter states the "EAW describes purposeful avoidance of potential mitigation offered by “green infrastructure” as part of intentional project design."	Thank you for the comment.
143	Commenter states, "We're headed for global famine by the end of the century if	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	we keep allowing industries like this to trash our only planet."	
144	Commenter states, "I am very concerned about the harmful effects of industrial dairying by Riverview, LLP."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
145	Commenter states, "Being an organic home Gardner for over 50 years I know the importance of toxins!"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
146	Commenters note that the Project will increase pollution.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
147	Commenter states, "the EAW documents are filled with concerns about water allotment, catch basins, and manure proximity to bodies of water."	The EAW is a brief document prepared in worksheet format designed to rapidly assess the environmental effects which may be associated with a proposed project. The EAW serves primarily to aid in the determination of whether an EIS is needed for a proposed project; and serve as a basis to begin the scoping process for an EIS.
148	Commenters state that this "kind of farming" is bad for the environment and communities.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
149	Commenter states, "It's well known that leaks, and contamination will occur, it's more a matter of when not if."	The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and the Feedlot Permit. The LMSA design requirements in rule and the Feedlot Permit, along with enhanced liner thickness (5 feet) will reduce theoretical seepage and provide greater groundwater protection.
150	Commenter states, "Can we even hold Riverview LLP accountable in any case of environment damage in the future? If we cannot guarantee the accountability, then we must not let Riverview LLP have this opportunity to abuse the environment."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
151	Commenter states, "Citizens have the right to determine the magnitude of how this	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	new feedlot would introduce a nuisance onto the land."	
152	Commenter states, "Large numbers of live stock mean less crop diversity."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
153	Commenters are concerned that the large facility will result in increased nitrate contamination.	The Project is required to follow Minn. R. Ch. 7020 and Feedlot Permit requirements relating to application of nutrients (manure) generated from the Project in combination with other nutrient sources. Potential sources of N include commercial fertilizer, manure applied during the current crop year, manure applied during the previous crop year, irrigation water, and legumes grown during previous years. The Project's nutrient management plan describes how manure in combination with other nutrient sources will be applied at agronomic rates. N rates must be limited so that the estimated plant-available nitrogen (N) from all N sources does not exceed the expected crop N needs for non-legume crops or the expected N removal for legume crops. To further minimize the potential for nitrate leaching into the groundwater, the Feedlot Permit requires the Project implement N BMPs based on the timing of manure application and field location. Potential BMPs requirements include application to actively growing crops, planting cover crops, use of a nitrapyrin-based nitrogen stabilizing product, delaying application until soil temperature has reached 50 degrees or less for two consecutive days, crop rotations that include growing perennial crops 2 years during any 5-year period and reduced rate split N applications.
154	Commenter states, "the EAW does not demonstrate that the Expansion Project's manure can be applied at agronomic rates each year without increasing nitrous oxide or transport-related emissions, and runoff risk and other pollution."	Minn. R. Ch. 7020 and the Individual NPDES Permit contains specific requirements relating the application of manure. The requirements found in rule and the permit are designed to provide protection to Minnesota surface and groundwater. The MPCA staff reviewed the Project application materials and found them to meet Minn. R. Ch. 7020 requirements and NPDES Permit requirements. Please also see response to comment group 119.
155	Commenters are concerned about past violations by Riverview.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
156	Commenter states, "EAW does not properly characterize past, present and future environmental conditions of the environmentally relevant area."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
157	Commenter makes the following assertion: Translation of science to policy.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	Requirements for issuing permits for CAFOs should include increased protections for health and the environment including the following: • CAFOs should be sited and issued permits on the basis of total animal density allowed in a given watershed as determined by the carrying capacity. • Environmental impact statements should be mandated for all new CAFOs. These should include environmental health, social justice, and socioeconomic issues. • Decisions to issue permits for CAFOs should be considered in public meeting and decided at the local level. • CAFOs should be regulated using standards applied to general industry based on the level of emissions and type of waste handling. • Permits for manure storage basins should require bonding for performance and remediation. • The current state of knowledge of community impacts of CAFOs warrants support for the American Public Health Association recommendation for a moratorium on all new CAFO construction."	The Comment is also beyond the scope of applicable feedlot regulations (U.S.C. 1251, 40 CFR pts. 52, 122, 123, 127, 412, Minn. Stat. Ch. 115 and 116, Minn. R. Ch. 7001, 7009, 7020, 7053, 7060, and 7090), and Individual NPDES Feedlot Permit requirements the Project is required to meet.
158	Commenter states, "I grew up on a small dairy farm in southeastern Ottertail County. Our profits were fair and competitive."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
159	Commenters discuss good stewardship and sustainability of farming.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
160	Commenters are concerned about future spills.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
161	Commenter suggests MPCA should "Bring back the sea of grass, save the soil and the pollinators."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
162	Commenters contend that livestock needs to be more spread out across the state into smaller dairies.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
163	Commenters are concerned the Project will threaten biodiversity.	The DNR conducted a search of the Natural Heritage Information System (NHIS) for the Project site and identified no ecologically significant areas or state-listed Endangered or Threatened species documented within the vicinity of the Project site. The Prairie Mimosa (Desanthus illionoensis), which is a State-listed special concern species in the vicinity of the Project site, would not be a suitable area for survival in the Project site. The DNR noted that they do not believe the Project will affect any known occurrences of rare features, including any State-listed species, rare plant communities, or other sensitive ecological resources. Three areas with Moderate Biodiversity Significance ranking near the manure areas and Seven areas with Below Biodiversity Significance ranking near the manure areas were found by the DNR. To avoid any potential impacts to these mapped areas, the Proposer reviewed the above listed areas and if there was overlap, they either amended field boundaries to avoid the above identified features or removed the entire field from consideration.
164	Commenter states, "If current trends continue—prioritizing short-term production over ecological limits—we risk accelerating climate instability."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
165	Commenters are concerned the Project will threaten the ecosystem.	The Project site, the Project waterline route, and the proposed Project manure application sites are all located on agricultural production land. Since row-crop production land is not identified as suitable habitat for any known fish, wildlife, plant communities, rare features, and ecosystems, no projected negative effects from those areas were identified. The only portion of the Project not in row-crop production is the portion of the Project waterline where the Off-Site Well/APEC Well is located, which is currently in agricultural production pastureland. After the underground water line is installed, the disturbed area will be restored to its current condition. Ecosystems are not expected to be directly affected by the Project.
166	Commenters are concerned about the ecological impacts of the Project.	Please see response to comment group 163 and comment group 165.

Comment Group	Comment	Response
167	Commenters state that the Project is a threat to the environment.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
168	Commenter claims, "they destroy farm land with no care."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
169	Commenters are concerned about the Projects impact on the flora and fauna in the area.	The Small White Lady's Slipper (Cypripedium candidum) has been documented near a proposed manure application area. This species can be found in mesic native prairies and wet prairies; it cannot grow in habitats on land used for livestock grazing or crop production. In addition, the Prairie Mimosa (Desmanthus illinoensis) has been documented near a proposed manure application area. This species can be found in mesic native prairie and on sandy lake shores. The DNR recommends avoiding areas with suitable habitat for these two species in the proposed manure application areas. However, the Project only includes manure application to land that is in crop production, and that is not considered suitable habitat for either species. The DNR had no records of any federally listed species within one mile of the manure application areas. Please also see responses to comment groups 163 and 165.
170	Commenters are concerned the Project will threaten the safety of our food supply.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
171	Commenter states, "CAFOs pose well known and documented environmental risk as a result of destruction of grazing land."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
172	Commenters are concerned about the loss of habitat.	The Elktoe mussel (Alasmidonta marginata) was documented in a portion of the Pomme de Terre River in 2007. Although its status near the manure application areas is unknown, mussels are particularly vulnerable to deterioration in water quality. The Project will operate with an MPCA-approved Manure Management Plan (MMP), which regulates manure application and requires following BMPs such as agronomic rates and setbacks from surface waters to avoid adverse impacts and minimize runoff from the field. The IPaC identified no federally protected endangered species or critical habitats within the Project site. The Northern Long-Eared Bat (Myotis septentrionalis) is a federally endangered species identified in the vicinity of the Project waterline route and Project manure application area. There are no critical habitats designated for this species, and the Project is unlikely to affect its habitat, as the waterline route installation will cause short-term disturbances with no tree removal. The U.S. Fish and Wildlife Service site Information for Planning and Consultation (IPaC) identified the presence of Bald Eagles (Haliaeetus leucocephalus) in the vicinity of the Project. No nests were observed as of 2023 and the closest trees capable of being utilized for nest sites are 2,300 feet away in the Waterfowl Production Area south of Project site and the manure application area. Please also see responses to comment groups 163, 165. and 169.

Comment Group	Comment	Response
173	Commenters are concerned about the threat to wildlife.	DNR identified (EAW attachment 7a) that no state-listed endangered species have been documented in the vicinity of the Project and that they do not believe the Project will affect any known occurrences of rare features, including any State-listed species, rare plant communities, or other sensitive ecological resources for the Project waterline route.
174	Commenters note there a number of waterfowl and wildlife production areas in the area.	Fish and wildlife resources are limited at the Project site; however, natural resources are available near the Project. These include: Gorder Lake, 0.86 miles north of the Project; Landers Waterfowl Production Area, 0.5 miles south of the Project; the Bill Freeman Wildlife Management Area, 0.26 miles west of the Off-Site Well/APEC Well; and the Pomme de Terre River, 3.84 miles east of the Project and 0.11 miles east of the Off-Site Well/APEC Well. Efforts to avoid fish and wildlife resources for this Project are included in the manure application sites (Manure Management Plan). Please also see response to comment group 165.
175	Commenter is concerned about the cumulative of all the animal units in the county and watershed will increase the threat to protected wildlife.	DNR identified (EAW attachment 7a) that no state-listed endangered species have been documented in the vicinity of the project and that they do not believe the Project will affect any known occurrences of rare features, including any State-listed species, rare plant communities, or other sensitive ecological resources for the Project waterline route.
176	Commenters state the Project is a threat to our land.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
177	Commenter is concerned about the impact the Project will have on appropriate land use.	The Project as proposed is consistent with current local zoning regulations. Land use and zoning are done at the local level in Minnesota. Changes to zoning laws must be done at the county or township level.
178	Commenters are concerned about the impact on the landscape.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
179	Commenter is concerned marginal farmland will be farmed more intensely out of convenience for large equipment to be used.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
180	Commenters are concerned about the threat to our natural resources.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
181	Commenters state the Project will create environmental conditions that will devastate the living conditions for surrounding properties.	The potential air emissions expected from the proposed project were modeled. H_2S concentration is 29.44 parts per billion which is below the ambient standards. NH_3 concentration is 2,009 µg/m3 which is below the acute levels. GHG total emissions are 72,210 tons/year (there are no federal or state threshold levels for GHG emissions). The Proposer is subject to all permit requirements, including those in the Minnesota Individual Feedlot Permit (EAW attachment 22) which will require

Comment Group	Comment	Response
		an Air Emission Plan that includes methods to mitigate odors and a Manure Management Plan (EAW attachment 23). Minnesota Department of Transportation data indicates that Annual Average Daily Traffic (AADT) near the Project on Stevens County Road 8 is 520 vehicles. The Project would increase current traffic counts by an estimated total of 45 vehicles per day. Therefore, the traffic on Stevens County Road 8 would increase by up to 8.7%, and the potential for traffic congestion is considered low. No improvements to County Road 8 are considered necessary to accommodate this increase in traffic. Feeding activities, which would be peak noise times, typically take place during the morning and early afternoon. The noise level was measured with a sound level meter along the property lines during peak operation time at the Existing Facility. The highest noise level recorded was 48.5 decibels, which is equivalent to the noise in a library and below the most stringent noise standards (NAC 1). For the benefit of wildlife and the reduction of insect attraction, the Proposer will consider a previous DNR recommended best management practice of choosing downward-facing and shielded fixtures to prevent light pollution. The Proposer will cover the liquid manure storage areas (facilities 101, 102, & 106) with impermeable synthetic covers, and pump liquid manure through pipelines.
182	Commenters are concerned about the threat to the Pomme de Terre River.	The Project Site and the Off-Site Well/APEC Well are within the Pomme de Terre River Watershed. There are no lakes, streams, wetlands, or intermittent streams at the Project site. There are no aquatic invasive species or impaired waters within one mile of the Project site. Surface water from the Project will flow south/east to County Tile 30, which runs across the south side of the Project site. County Tile 30 outlets into two unnamed creeks (WID 070200002-551 and 07020002-552),13 which then flows to the Pomme de Terre River (WID 07020002-501), and then eventually to the Minnesota River (WID 070200001-552). The Off-Site Well/APEC Well is approximately 500 feet west of the Pomme de Terre River. The Project site is designed to capture and reuse most or all of stormwater runoff, largely eliminating the untreated runoff that currently leaves the property. In addition, Best Management Practices (BMPs) will be adhered to with this Project to limit the potential for nitrate impacts on water resources including manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features and other waterbodies. The Project will replace cropland with impervious surface, grass/landscaping, and stormwater basins. The addition of stormwater basins will balance stormwater flow by collecting and filtering the water before release. Additionally, the impervious surface will include feed storage and solid manure storage areas. The Project will direct runoff from the feed storage and solid manure storage areas to an LMSA for land application.

Comment Group	Comment	Response
		Ultimately, the calculated runoff for the Project site will decrease to 106 MGY and the post-treatment runoff sediment and nutrient amounts will decrease to 0.05 tons/acre of sediment annually (EAW attachment 24). Water that is not recaptured would be discharged to the county tile system after passing through a stormwater basin with natural filtration. The water discharge rate would follow agronomic rates and would not be higher than it would be without the dairy.
183	Commenters are concerned the Project will threaten the soil quality in Stevens County.	Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit.
184	Commenter states, "The ecological setting for this massive, multifaceted food (milk) industry enterprise is one that has, over many decades, been incrementally degraded to such an impoverished level that the beneficial functions (services) original ecosystems once provided have been all but obliterated." ... "This EAW hints at what the area used to be and in subtle ways justifies the projects contribution to the ecological destruction by explaining that the land is now only used for agriculture and therefore there is little measurable impact on the parts which remain in their “natural” state."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
185	Commenter states, "This dairy and it's feed suppliers will use huge farm equipment, which means bigger fields, and more erosion."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
186	Commenters are concerned the Project will alter cropping practices as to cause an increase in wind erosion from the cropland.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
187	Commenter states, "Such harms should be quantified to weigh against our state's stated emissions and environmental	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	protection goals prior to considering the project for approval."	
188	Commenter states, "We need full transparency and accountability in this permitting process."	MPCA held a public comment period from February 10 - May 7, 2026. In addition, a public meeting was held on April 28, 2026, in Morris.
189	Commenter notes the Project is located in a vulnerable area.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
190	Commenters ask if the aquifer has been thoroughly studied?	The Project will use an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project. The APEC/Off-Site Well is appropriated for the withdrawal of 452 million gallons per year (MGY) total, 226 MGY for APEC and 226 MGY for livestock watering (Proposer) as outlined in existing MN DNR Permit #2008-0230. The appropriation was established based on the results of a seven-day aquifer pump test that identified sufficient water in the water-table aquifer and confirmed that the aquifer is hydraulically connected to the Pomme De Terre River. Water Appropriation Permit 2008-0230 is not eligible for transfer to the Proposer. This permit was issued for a different project that was never developed. West River Dairy has applied for a new water appropriation from this same well (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. DNR consulted with Riverview on the use of this well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230. DNR is evaluating the proposed use of that well against statutory and rule requirements. The Proposer has applied for a new water appropriation from the APEC/Off-Site Well for 226 MGY for livestock watering. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. The Proposer will comply with all DNR pumping restrictions for the APEC/Off-Site Well.
191	Commenters are concerned about advancing permits for the Project with old or incomplete information on the Aquifer.	A new aquifer test for the Off-Site Well/APEC Well was waived by the DNR since the Proposer will abide by the following parameters: Pumping will occur from only the Off-Site Well/APEC Well, no more than 226 MGY is to be used at a rate not to exceed 1,000 gpm, pumping is subject to restrictions up to and including cessation of pumping depending on the flow conditions of the Pomme de Terre River and the Proposer will construct water storage basins to store a contingency supply of water. This contingency will allow flexibility if pumping restrictions of the Off-Site Well/APEC Well are ever required during low-flow periods. The Proposer has designed the facility to direct an average of 90 MGY of clean run-off from the project as another water source contingency.

Comment Group	Comment	Response
192	Commenters state the EAW does not describe how the existing permitted wells will be integrated with the well proposed to be used for the expansion.	The Project will use an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project. The APEC/Off-Site Well is appropriated for the withdrawal of 452 million gallons per year (MGY) total, 226 MGY for APEC and 226 MGY for livestock watering (Proposer) as outlined in existing MN DNR Permit #2008-0230. The appropriation was established based on the results of a seven-day aquifer pump test that identified sufficient water in the water-table aquifer and confirmed that the aquifer is hydraulically connected to the Pomme De Terre River. Water Appropriation Permit 2008-0230 is not eligible for transfer to the Proposer. This permit was issued for a different project that was never developed. West River Dairy has applied for a new water appropriation from this same well (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. DNR consulted with Riverview on the use of this well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230. DNR is evaluating the proposed use of that well against statutory and rule requirements. The Proposer has applied for a new water appropriation from the APEC/Off-Site Well for 226 MGY for livestock watering. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. The Proposer will comply with all DNR pumping restrictions for the APEC/Off-Site Well.
193	Commenters are concerned about groundwater and drinking water getting contaminated by manure.	The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and this Permit. Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. The Minnesota Department of Health (MDH) Well Management Program oversees public and private wells in Minnesota. The MDH's "Owner's Guide to Wells" states that the homeowner is responsible for regularly testing their well water. This includes laboratory analysis for bacteria annually and nitrate-nitrogen (nitrate) testing every other year. Please visit MDH's website for more information on well testing and health related questions.

Comment Group	Comment	Response
194	Comments are related to an issue of over pumping water in Arizona by Riverview.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
195	Commenters are concerned about the volume of water being used and how it will affect their wells.	The primary source of water will be an existing Off-Site Well/APEC Well as well as two water storage basins to serve as a contingency (facilities 501 and 502) in the event groundwater availability is disrupted. For groundwater extraction, the Proposer has chosen to use an off-site well screened in a different aquifer than the wells utilized by the existing facility. The basins will be filled with well water outside restricted periods. The water storage basins will also store an average of 90 MGY of collected stormwater per year, reducing reliance on a single water source. The Proposer has applied for a new water appropriation from this same Off-Site Well/APEC Well (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. Additionally, although the on-site wells and the off-site well are screened in different aquifers, DNR's analysis shows that the shallow and deep aquifers in this area are hydraulically connected and function as a single groundwater system with limited water availability. Consequently, the proposed wells do not provide a diversified groundwater source. Because of these hydraulic connections, cumulative existing and proposed water appropriations will be evaluated during the DNR's water appropriation permitting process.
196	Commenters are concerned the DNR has not completed the Geologic Atlas for Stevens County which would include a hydrologic survey.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
197	Commenters would like to know where the water comes from?	Please see response to comment group 195.
198	Commenter wants to know what aquifer will be used for the off-site well?	The groundwater source for the Project will be an Off-Site Well/APEC Well, approximately three miles southeast of the Project. The Off-Site Well/APEC Well is near the Pomme de Terre River valley and is screened in a Quaternary Water Table Aquifer (QWTA), while the wells for the existing facility are screened in the Quaternary Buried Artesian Aquifer (QBAA) beneath the Project site. For groundwater extraction, the Proposer has chosen to use an off-site well screened in a different aquifer than the wells utilized by the Existing Facility. Water Appropriation Permit 2008-0230 is not eligible for transfer to the Proposer. This permit was issued for a different project that was never developed. West River Dairy has applied for a new water appropriation from this same Off-Site Well/APEC (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. Groundwater availability is moderate to limited in this area. As identified in permit 2008-0230, the groundwater appropriation from this well can directly impact the river and is subject to

Comment Group	Comment	Response
		existing permit conditions based on the river flow. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. Conditions would be modified from those currently included with 2008-0230, including restrictions on the ability to appropriate water during summer months. Additionally, DNR will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site. Additionally, although the on-site wells and the off-site well are screened in different aquifers, DNR's analysis shows that the shallow and deep aquifers in this area are hydraulically connected and function as a single groundwater system with limited water availability. Consequently, the proposed wells do not provide a diversified groundwater source. Because of these hydraulic connections, cumulative existing and proposed water appropriations will be evaluated during the DNR's water appropriation permitting process.
199	Commenters want to know if the Project will be using water from the Sioux Aquifer?	No, the groundwater source for the Project will be an Off-Site Well/APEC Well, approximately three miles southeast of the Project. The Off-Site Well/APEC Well is near the Pomme de Terre River valley and is screened in a Quaternary Water Table Aquifer (QWTA), while the wells for the existing facility are screened in the Quaternary Buried Artesian Aquifer (QBAA) beneath the Project site.
200	Commenter wants to know what will happen if the off-site well is connected to the Sioux Aquifer?	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
201	Commenter wants to know if wells in the area have been monitored for depth and quality?	There is one well (UN#: 768109) within the Project footprint that is 138 feet deep and screened in a buried quaternary (confined) artesian aquifer. This well has an existing DNR water appropriation (DNR Permit #2009-0492) for both irrigation and livestock watering. Nine domestic wells and four commercial wells have been identified within one mile of the Project site. Four commercial wells and one domestic well (UN#: 682246, 6822488, 731318, 757860, & 836244) are at the existing facility. The remaining domestic wells are at rural farmsteads. There are no public water supply wells within or adjacent to the Project or any manure application areas. As outlined in the Aquifer Test Report for the Off-Site Well/APEC Well, a well survey was completed for all wells within 1.5 miles of the Off-Site Well/APEC Well. In addition, the Minnesota Department of Health (MDH) Well Management Program oversees public and private wells in Minnesota. The MDH's "Owner's Guide to Wells" states that the homeowner is responsible for regularly testing their well water. This includes laboratory analysis for bacteria annually and nitrate-nitrogen (nitrate) testing every other year. Please visit MDH's website for more information on well testing and health related questions.
202	Commenter states, "A project of this scope demands careful and exacting review of cumulative impacts, including existing	The Environmentally Relevant Area (ERA) for the Project has been delineated to ensure that environmental effects from other projects do not overlap. The ERA is defined as the oversized Project Boundary, all identified manure application fields designated for the Project and Existing Facility, and

Comment Group	Comment	Response
	animal units of all operations within the county and watershed, the increased demand on area water resources with potential threats to existing wells."	a one-mile radius surrounding the Off-Site Well/APEC Well. This generously sized ERA will keep other project-related environmental effects from overlapping with those from the Project, thereby avoiding the potential for cumulative potential effects. Cumulative potential effects for feedlot projects would generally be related to overlapping manure application and excess water usage within the same Environmentally Relevant Area (ERA) by other similar projects. The Proposer established an ERA which includes sufficient manure acres for the Project and the existing facility and has over 3,000 additional acres extra to account for possible unknowns. These designated manure acres are not only established in this EAW, but they will also be reported in the Manure Management Plan that is submitted to the MPCA. For groundwater extraction, the Proposer has chosen to use an Off-Site Well/APEC Well screened in a different aquifer than the wells utilized by the existing facility. Water Appropriation Permit 2008-0230 is not eligible for transfer to the Proposer. This permit was issued for a different project that was never developed. The Proposer has applied for a new water appropriation from this same well (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. DNR consulted with the Riverview on the use of this well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230. DNR is evaluating the proposed use of that well against statutory and rule requirements.
203	Commenter asks, "How about that aquifer under us from the Gulf of Mexico to the Canadian border? Is it drawn down beyond use yet?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
204	Commenter states, "75% of Minnesotans rely on groundwater for their source of drinking water."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
205	Commenter states, "the research documents that groundwater contamination from intensive livestock farming can have legacy effects with lag times exceeding 20 years. [Kim et al., 2021] The full consequences of today's permitting decisions may not fully appear in Minnesota's water supply for two decades. By the time the harm is visible, the facility will be entrenched, the contamination will	The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and this Permit. Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer

Comment Group	Comment	Response
	be established, and the opportunity to prevent it will be gone."	will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. There are no Drinking Water Supply Management Areas (DWSMAs) or Source Water Protection Areas (SWPAs) near the Project or the manure application fields. The Groundwater Contamination Susceptibility in Minnesota report estimates the potential for groundwater pollution. In June 2016, the DNR updated this evaluation. The report uses a matrix for determining a sensitivity rating of the water table ranging from very high to very low based on aquifer material, recharge potential, soil materials, and vadose zone materials. After review of the published information related to pollution sensitivity potential the Project and its manure application fields are primarily in an area designated as having a low sensitivity to groundwater pollution. Specifically, of the 16,669 manure acres designated for the proposed Project, only 425 acres are within sensitive areas that have fall fertilizer application restrictions.
206	Commenter states that when his dad applied anhydrous ammonia to his neighbor's cornfields it polluted their well water.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
207	Commenter asks, "What do we do when the aquifer is gone, or polluted?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
208	Commenter notes the EAW does not provide calculations to demonstrate that the on-site water storage basins are appropriately sized.	Unlike stormwater basins, the water storage basins will be designed for long-term water storage. The water source for the water storage basins will come from the off-site well and stormwater runoff collected from other areas of the Project. The site is designed so that no stormwater runoff will naturally enter the water storage basins. Facility 503 will house the pumping equipment necessary to transfer water from the water storage basins to the appropriate facilities. The total size of the water storage basins and pump building will be approximately 21.6 acres with a combined design capacity of 157 million gallons of water and are designed to hold a 9-month contingency water supply in the event the well pumping is restricted for extended periods. The Project is designed to direct run-off water from the Project site to the water storage basins for reuse. The Proposer conservatively calculates that they will be able to collect and reuse an average of 90 million gallons per year (MGY) of stormwater runoff from the Project site. This backup source of clean water has proven effective as a mitigation tool at similar facilities operated by the Proposer.
209	Commenter states, "With climate change data [from] the past 30 years we know not	Climate projections suggest big rains will continue increasing into the future. Therefore, there may be a decrease in area irrigation well usage due to more moisture received from rain and increased stormwater. The groundwater source for the Project will be an Off-Site Well/APEC Well,

Comment Group	Comment	Response
	[to] expect aquifers to recharge, or for water sources to become more plentiful."	approximately three miles southeast of the Project as well as two water storage basins to serve as a contingency (facilities 501 and 502) in the event groundwater availability is disrupted. The Off-Site Well/APEC Well is near the Pomme de Terre River valley and is screened in a Quaternary Water Table Aquifer (QWTA), while the wells for the existing facility are screened in the Quaternary Buried Artesian Aquifer (QBAA) beneath the Project site. For groundwater extraction, the Proposer has chosen to use an off-site well screened in a different aquifer than the wells utilized by the Existing Facility. As a contingency measure for seasonal fluctuations and/or potential pumping restrictions, two water storage basins (Facilities 501 and 502), will be constructed as part of the Project. The basins will be filled with well water outside restricted periods. The water storage basins will also store an average of 90 MGY of collected stormwater per year, reducing reliance on a single water source. Moreover, groundwater use is highly regulated by the MN DNR through its Water Appropriation Permit process. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. Conditions would be modified from those currently included with 2008-0230, including restrictions on the ability to appropriate water during summer months. Additionally, DNR will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site. Please also see response to comment group 208.
210	Commenter asks, "What will happen if there is a drought?"	In Table 4: Historic Climate Trends in the EAW, it states that the historic trend for maximum number of consecutive days without rain during the growing season in Stevens County has averaged 15.6 days since 1995. The future projection for maximum number of consecutive days without rain during the growing season in Stevens County is expected to increase by 1.6 days. The Project's water source for the water storage basins will come from the off-site well and stormwater runoff collected from other areas of the Project. The site is designed so that no stormwater runoff will naturally enter the water storage basins. The Proposer conservatively calculates that they will be able to collect and reuse an average of 90 million gallons per year (MGY) of stormwater runoff from the Project site. This backup source of clean water has proven effective as a mitigation tool at similar facilities operated by the Proposer. In addition, the Aquifer Test Report from the 7-day aquifer pump test for the Project includes pumping conditions which were recommended by the DNR to protect the river in the event of drought or low surface-water flows. The Proposer will follow the DNR-identified restrictions on pumping levels and/or cessation of pumping based on the measured flow conditions of the Pomme de Terre River.
211	Comments are related to water usage by Data Centers.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
212	Commenter relates actions taken by Riverview at Dollymont Dairy.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
213	Commenter states, the ethanol plant in Morris gets water directly from the city instead of the wells it used.	The ethanol plant in Morris (DENCO II) is not the same ethanol plant (APEC) that initially drilled and permitted the well that West River Dairy proposes to use. The APEC Ethanol Plant was not constructed.
214	Comments are related to the wells at the existing site.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
215	Commenter believes that allowing the Project to go forward will be a huge experiment in aquifer depletion.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
216	Commenter states, "the EAW does not address the impact altered hydrology has on river flow and thus whether the flow-based permit conditions will protect natural resources."	The Minnesota DNR is the authority for water appropriation permitting, and as part of the process is completing a re-evaluation of stream flow in the Pomme de Terre River to inform decision making. If a permit is authorized, it would be expected to include permit conditions based on stream flow. Conditions would be modified from those currently included with 2008-0230, including restrictions on the ability to appropriate water during summer months. Additionally, DNR will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site.
217	Commenter asks, “How much additional water will be?”	The existing facility uses approximately 95 million gallons per year (MGY). The Project will add 226 MGY, for a total of 321 MGY.
218	Comments state that CAFOs will have an impact on groundwater supply and quality.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
219	Commenter is concerned that if the aquifer is contaminated that it will in turn contaminate lakes.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
220	Commenter states, "I fear a massive dairy of this size will only increase water consumption."	The Project will use an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project. The APEC/Off-Site Well is an existing well originally constructed for an ethanol plant (APEC) (not constructed). The APEC/Off-Site Well is appropriated for the withdrawal of 452 million gallons per year (MGY) total, 226 MGY for APEC and 226 MGY for livestock watering (Proposer) as outlined in existing MN DNR Permit #2008-0230. The appropriation was established based on the results of a seven-day aquifer pump test that identified sufficient water in the water-table aquifer and confirmed that the aquifer is hydraulically connected to the Pomme De Terre River. As recommended in the Aquifer Test Report, pumping conditions were imposed by the DNR to protect the river in the event of drought or low surface-water flows. This permit was issued for a different project that was never developed. Water Appropriation Permit 2008-0230 is not eligible for

Comment Group	Comment	Response
		transfer to the Proposer. The Proposer has applied for a new water appropriation from the APEC/Off-Site Well for 226 MGY for livestock watering. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. The Proposer will comply with all DNR pumping restrictions for the APEC/Off-Site Well. In addition, the Proposer will collect stormwater with water storage basins located onsite (Facilities 501 and 502) which will account for 157 MGY. The Proposer will also collect and reuse 90 MGY of stormwater from Project runoff directed to water storage basins to be used for livestock watering.
221	Commenter states that it appears there is increased irrigation in the area.	Please see response to comment group 220.
222	Commenter states there are new irrigation wells near the off-site well that were installed after the 2007 aquifer test was completed.	West River Dairy has applied for a new water appropriation for the Project to use the APEC/Off-Site Well (developed for permit 2008-0230), but it is a new application for a new permit. If authorized, a new appropriation permit would replace and modify permit 2008-0230, which will be terminated. DNR consulted with Riverview on the use of this well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230. DNR is evaluating the proposed use of that well against statutory and rule requirements.
223	Commenter states, "The MPCAs own site lists 1800 old, unpermitted, mostly unlined solid waste dump sites that are contaminating our groundwater, with 43 construction and demolition dump sites being monitored only as of 2010 showing arsenic, boron and manganese at levels beyond human and environmental standards and mitigation efforts are not helping. That's only 43 out of 1800 that are even monitored?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
224	Commenters want to know who pays if wells go dry or become contaminated?	The Project will use an off-site well (UN# 740629, APEC/Off-Site Well), approximately three miles southeast of the Project. The APEC/Off-Site Well is an existing well originally constructed for an ethanol plant (APEC) (not constructed). The APEC/Off-Site Well is appropriated for the withdrawal of 452 million gallons per year (MGY) total, 226 MGY for APEC and 226 MGY for livestock watering (Proposer) as outlined in existing MN DNR Permit #2008-0230. This permit was issued for a different project that was never developed. Water Appropriation Permit 2008-0230 is not eligible for transfer

Comment Group	Comment	Response
		to the Proposer. The Proposer has applied for a new water appropriation from the APEC/Off-Site Well for 226 MGY for livestock watering. MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a permit is authorized, it would be expected to include permit conditions based on stream flow. The Proposer will comply with all DNR pumping restrictions for the APEC/Off-Site Well. In addition, the Proposer will collect stormwater with water storage basins located onsite (Facilities 501 and 502) which will account for 157 MGY. The Proposer will also collect and reuse 90 MGY of stormwater from Project runoff directed to water storage basins to be used for livestock watering. A DNR water appropriation permit is required for any individual, business, or entity that withdraws large volumes of surface water or groundwater. It ensures that high-volume water use is sustainable, does not harm the environment, and does not conflict with other users. The water appropriation permit for this Project will serve to limit pumping so it does not dry up nearby lakes, streams, or aquifers.
225	Commenter believes there needs to be intensive water well testing by an independent testing company before Project is approved.	The Proposer consulted with DNR on the use of the APEC/Off-Site Well and confirmed that an additional aquifer test would not be needed from the well provided the new application proposed equal or lesser annual quantities and instantaneous pump rates to what was authorized in permit 2008-0230. Although the on-site wells and the off-site well are screened in different aquifers, DNR's analysis shows that the shallow and deep aquifers in this area are hydraulically connected and function as a single groundwater system with limited water availability. Consequently, the proposed wells do not provide a diversified groundwater source. Because of these hydraulic connections, cumulative existing and proposed water appropriations will be evaluated during the DNR's water appropriation permitting process. Please also see response to comment group 220.
226	Commenter requests "that the MPCA: 2. Require rigorous groundwater monitoring and publicly accessible reporting."	Minn. R. Ch. 7020 and the Individual NPDES Permit contains specific requirements for locating, constructing, and operating feedlot facilities in Minnesota. The requirements found in rule and the permit are designed to provide protection for Minnesota groundwater. Permit application information included engineered design plans, construction specifications, construction testing and operation and maintenance plans for proposed manure storage areas at the site. The Permit requires the Permittee to conduct weekly inspections of manure storage areas monthly inspections of manure storage area perimeter tiles and reporting of any spills or discharges. Additionally, the Projects proposed earthen lined manure storage areas will be constructed with compacted clay liners that are three feet thicker than required by rule.
227	Commenters ask MPCA to protect Minnesota's groundwater.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
228	Commenter makes unfounded allegations about past employment of current MPCA Commissioner.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
229	Commenter pleads with MPCA to take our mission seriously and be proactive.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
230	Commenter is concerned about people in town not being able to afford to treat their water from the city.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
231	Commenter states water is not a renewable resource.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
232	Commenters have read articles about groundwater issues in other states.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
233	Commenter asks how much Riverview pays for their water.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
234	Commenter states the groundwater near dairy operations has been found to contain PFAS.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
235	Commenter wants to know, "Are we willing to empty our already limited aquifers in the name of a mega corporation over our own residents?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
236	Commenter states there is no information in the EAW relating to recharge rates.	MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River, and if a water appropriation permit is authorized, it would be expected to include permit conditions based on stream flow. Conditions would be modified from those currently included with 2008-0230, including restrictions on the ability to appropriate water during summer months.
237	Commenter wants to know if Riverview, "Can they treat and reuse the treated water instead of using fresh water?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
238	Commenter states, "The Driftless Area in SE MN (in places like Lewiston, where Rush Creek is) has a "Swiss cheese" geology, which is why we have cold water spring	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	creeks in the area. Water from the surface can reach the aquifer in 0-3 days."	
239	Commenter states, "We also have polluted ground water that have also been impacted by these "accidents"."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
240	Commenter states, "The degradation of the ground water are externalities that are invariably left for the community or state to deal with."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
241	Commenter suggests MPCA get comments from the Soil Water and Conservation District (SWCD) on the EAW.	The local SWCD always receives a copy of the Notice of Availability for the EAW along with a copy of the EAW and may comment on the EAW.
242	Commenter, a citizen of Winona County, sympathizes with the people near Morris.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
243	Commenter states, "they use massive amounts of fertilizers and other chemicals to grow the feed for these cattle."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
244	Commenter states the MPCA must require Riverview to install synthetic liners with leak detection.	All LMSAs will be lined with no less than 60” of compacted clay. The risk of contamination to groundwater quality due to the LMSAs is low given the clay-lined design for the Project exceeds the required soil seepage standard. Based on geotechnical review of boring logs the clay soils encountered on sites are suitable for use in liner material. A perimeter drain-tile system will be installed at an elevation below the liner of each of the three proposed earthen LMSAs to control seasonal sub-surface saturation as outlined in the Minnesota NPDES Individual Feedlot Permit (Feedlot Permit) application. Tile inspection ports will be installed near the LMSAs to enable inspection of the tile system. After construction, the Permit requires that the Proposer inspect the tile system on a monthly basis to ensure the drain-tile system is functioning correctly and to look for signs of discoloration or odor that may indicate an issue with the liner. Note LMSAs will be designed with enhanced clay liner thickness, and geology doesn’t warrant synthetic liners as per rule.
245	Commenter states, "More and more farm land is being tiled which quickly drains rain water off the field so it is no longer seeping into the ground to replenish the ground water."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
246	Commenter states, "as a Registered Professional Engineer, I believe this project—which would become the largest livestock farm in state history—poses unacceptable risks to our groundwater."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
247	Commenter states, "this does not benefit other water users."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
248	Commenter states, "I think a full environmental review is warranted to evaluate the potential noise pollution."	An Environmental Assessment Worksheet was completed for the Project. Project construction will create a temporary increase in noise and dust, mostly due to earthwork activities, delivery truck traffic, and construction equipment operating on unpaved surfaces. The nearest sensitive receptor is a rural residence 920 feet north of the Project. MPCA guidance on noise states that when a distance is doubled, the sound level decreases by six decibels (Distance Attenuation). Therefore, the noise from the Project at the nearest sensitive receptor would be near zero decibels and well below the most stringent MN noise standards. The Project is designed to operate with features that reduce noise. The manure vacuum and skid loaders are operated within the freestall barn (Facility 201). Front-end loaders and feed mixing wagons are primarily operated inside the commodity shed (Facility 207) and the freestall barn, with a small portion of feed preparation happening on the outdoor feed storage area (Facility 206). Equipment for milking and manure handling is within enclosed structures (Facilities 203 and 204, respectively).
249	Commenters are concerned about the increase in noise in the community.	Project construction will create a temporary increase in noise and dust, mostly due to earthwork activities, delivery truck traffic, and construction equipment operating on unpaved surfaces. The nearest sensitive receptor is a rural residence 920 feet north of the Project. MPCA guidance on noise states that when a distance is doubled, the sound level decreases by six decibels (Distance Attenuation). Therefore, the noise from the Project at the nearest sensitive receptor would be near zero decibels and well below the most stringent MN noise standards. The Project is designed to operate with features that reduce noise. The manure vacuum and skid loaders are operated within the freestall barn (Facility 201). Front-end loaders and feed mixing wagons are primarily operated inside the commodity shed (Facility 207) and the freestall barn, with a small portion of feed preparation happening on the outdoor feed storage area (Facility 206). Equipment for milking and manure handling is within enclosed structures (Facilities 203 and 204, respectively).
250	Commenter asks, "What will the impact to the public be in more than doubled truck traffic—traffic noise?"	Project construction will create a temporary increase in noise and dust, mostly due to earthwork activities, delivery truck traffic, and construction equipment operating on unpaved surfaces. The nearest sensitive receptor is a rural residence 920 feet north of the Project. MPCA guidance on noise states that when a distance is doubled, the sound level decreases by six decibels (Distance

Comment Group	Comment	Response
		Attenuation). Therefore, the noise from the Project at the nearest sensitive receptor would be near zero decibels and well below the most stringent MN noise standards. The Project is designed to operate with features that reduce noise. The manure vacuum and skid loaders are operated within the freestall barn (Facility 201). Equipment for milking and manure handling is within enclosed structures (Facilities 203 and 204, respectively).
251	Comment states there needs to be more baseline monitoring before the Project is constructed.	Prior to obtaining the DNR Water Appropriation Permit for the Facility, an aquifer test was completed, including continuous pumping of the Off-Site Well/APEC Well at 1,093 gallons per minute (gpm) for seven days while monitoring water levels in new observation wells, existing observation and potable wells, and nearby surface water levels. Based on the results of this aquifer test, the water-table aquifer used by the Off-Site Well/APEC Well was found to provide ample water, be hydraulically connected to the Pomme de Terre River, and that river flows need to be considered. The Aquifer Test Report included an assessment of potential impacts to surface-water features, including the historical examination of the Pomme de Terre River flows. Therefore, the DNR Water Appropriation Permit (2008-0230), includes a condition to reduce or restrict well pumping based on Pomme de Terre River flow. In addition, the Project will have an MPCA approved nutrient management plan that addresses phosphorus application rates in certain circumstances where there is elevated risk of phosphorous moving off the landscape into the water.
252	Commenters are concerned the basins are "leaking" manure and will impact surface waters.	The cows will be housed in a free-stall barn and will use clay-lined basins with impermeable covers to collect and store manure and wastewater. The manure storage basins will have covers to prevent stormwater from entering and causing overflow. Installation of a perimeter drain-tile system will be at an elevation below the liner of each of the three Liquid Manure Storage Areas (LMSAs) to control seasonal sub-surface saturation included in the Minnesota NPDES Individual Feedlot Permit. The Proposer will install an inspection port near the LMSAs to enable monthly visual inspections. After construction, the Proposer will ensure the drain-tile system is functioning correctly for each LMSA and look for signs of discoloration or odor that may indicate an issue with the liner. In addition, grading at the Project site will direct clean stormwater away from manure storage areas and feedstock storage areas and toward stormwater basins, where the water will be collected and treated before released back to the existing watershed at a controlled rate. Solid and liquid manure transferred to area farmers for use as fertilizer will be applied in accordance with Feedlot Permit requirements which protect the impact of pollution to surface waters.
253	Commenters are concerned the basins are "leaking" manure and will impact surface waters.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
		In relation to the Feedlot Permit, please see response to comment group 252.
254	Commenter states the EAW needs to, "12.B.1.c. If the wastewater discharge is to surface water, identify the wastewater treatment methods and identify discharge points and proposed effluent limitations to mitigate impacts. Discuss any effects to surface or groundwater from wastewater discharges, taking into consideration how current Minnesota climate trends and anticipated climate change in the general location of the project may influence the effects."	Residential wastewater from the facilities at the Project site will be treated by mound systems (septic tanks). All septic tanks (SSTSs) for will be pumped annually by Engebretson Pumping (MPCA Maintainer License #3265), based in the region. After the SSTSs are constructed per MN Rules 7080, the areas around them will be landscaped to divert any excess stormwater away which will prolong the life of each system. The risk of contamination of groundwater quality due to the Liquid Manure Storage Areas (LMSAs) is low due to the engineered concrete structures and clay-lined design for the Project. LMSAs at the Project site will exceed the required soil seepage standard, and LMSA clay-liner thickness will be increased from two feet to five feet. The Proposer may encounter shallow groundwater during construction of the LMSAs, so they will install a perimeter drain-tile system at an elevation that is lower than the liner within the LMSA to reduce external groundwater pressure on the walls and to control seasonal subsurface saturation near the LMSAs. The Project will reduce contamination risk from manure application to groundwater quality by following proper land application practices. The Proposer will follow requirements of Minn. R. 7020 and the MMP in the Feedlot Permit for manure application.
255	Commenters state there needs to be more cumulative impacts analysis from runoff from the site as well as the leaching from the manure basins.	The Project site is designed to capture and reuse most or all of stormwater runoff, largely eliminating the untreated runoff that currently leaves the property. The Proposer will comply with manure application procedures put in place to prevent runoff and impacts to waterbodies. Please also see responses to comment groups 252 and 274.
256	Commenters state there needs to be more cumulative impacts analysis related to manure/nutrient runoff from land application of manure.	Information about all the NMPs in the area impacted by the project is not "reasonably obtained information". Generally, MPCA relies on existing water quality data to determine if there is a cumulative impact. NOTE: Due to the number of identified impairments in the area we can assume there is a cumulative impact. However, the Proposer is complying with the evaluation criteria laid out in 4410.1700 Subp. 7.B. to minimize impacts. The feedlot permit requirements which include the individual NPDES permit and nutrient management plan reduce the likelihood of cumulative impacts on the watershed as the NPDES permit does not allow discharge from land application. Instead, the feedlot permit establishes conditions that reduce the likelihood of runoff, including a requirement to inject or immediately incorporate manure when there is a greater than 50 percent probability of 0.5 inches or more of rainfall within 24 hours after application (outside winter conditions), unless applied under an emergency. The inspection requirements—conducted daily during application, at completion, and within 24 hours after qualifying rainfall events within 14 days of application—are designed to identify any discharge at downgradient field edges, tile intakes,

Comment Group	Comment	Response
		ditches, or other conveyances. Required response and reporting of any observed discharge reduces the potential for unaddressed releases to contribute to cumulative effects in the watershed.
257	Commenter, MN DNR, has received and is reviewing a Dam Safety Permit application, 2026-0133, associated with the water storage ponds identified in item 9 of the EAW. This permit application was received on January 29, 2026.	Thank you for the comment.
258	Commenter notes that the impacts from the Project are to tributaries of the Mississippi River and thus contribute to the dead zone in the Gulf of Mexico.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
259	Commenter states, "I am concerned about the contaminants already in that river that, although they meet EPA guidelines, as was mentioned last night, those guidelines are out of date in regards to the current health concerns this river poses."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
260	Commenter states, "I am extremely concerned about the run off from the lot entering local water ways. We will need emergency plans in case of natural disasters should this gain approval."	The Project's Feedlot Permit application materials include an Emergency Response plan. If a spill or discharge occurs, the Permittee is responsible for containment and cleanup, as well as notifying the State Duty Officer.
261	Commenter states, "These rivers and waterways are crucial to the Midwest in being used to feed a nation."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
262	Commenter states, "It just takes a few flooding events per year to spread feces into waterways."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
263	Commenters want to know how long before they have to endure low quality waterways and lakes and have to install and	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	operate a costly treatment system for their well."	
264	Commenters state that CAFOs degrade rivers and streams.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
265	Commenters are concerned about the impact the Project will have on recreation and tourism in the area - especially as it relates to lakes and streams in the area.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
266	Commenters note there are a number of listed impaired waters in the area including the Pomme de Terre River.	The Project Site and the Off-Site Well/APEC Well are within the Pomme de Terre River Watershed. There are no lakes, streams, wetlands, or intermittent streams at the Project site. There are no impaired waters within one mile of the Project site. All the manure application sites are also within the Pomme de Terre River Watershed. There are several lakes, wetlands, and streams adjacent to the manure application sites, with seven total identified as being on the current 303d impaired waters list. Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state.
267	Commenter states, "I spent thirteen years living in Iowa prior to moving to Minnesota. Most of Iowa's animal agriculture operations are CAFOs, and regulation is minimal. As a result, most of Iowa's rivers and streams are aggressively polluted, many as a result of uncontained manure run-off. I do not want to see the same thing happen here."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
268	Commenter states, "I am extremely concerned about the runoff from the lot entering local water ways. We will need mitigation strategies detailed should this gain approval."	The Project will manage runoff in accordance with the Stormwater Pollution Prevention Plan (SWPPP) plan included with the Feedlot Permit application. The Feedlot Permit includes stormwater requirements for the treatment of construction stormwater when one or more acres of soil is disturbed and permanent treatment of stormwater when one acre or more of new impervious surface is created. The construction stormwater requirements will ensure that additional stormwater created by the Project will not degrade the water quality of the surrounding area. After construction is complete, the surface water runoff prior to any discharge from the Project will be controlled by

Comment Group	Comment	Response
		three permanent stormwater basins for volume control and have two water storage basins that will store stormwater and contingency groundwater at the Project site. Since all stormwater is contained on the Project, impacts to nearby lands are not expected. Best Management Practices (BMPs) include: (1) Stormwater will generally not come into contact with feed, animals, manure, or bedding. Any contaminated runoff will not leave the Project site and (2) the feed piles will be covered with impermeable plastic on an asphalt feed pad to minimize rainwater contact with the feed. Stormwater from the feed pad and solid manure storage areas will flow to Facility 106 (Feed Storage Pad) and be contained in a Liquid Manure Storage Area (LMSA) preventing it from entering local waterways.
269	Commenter states, "A report in EAW minimizes future low flow probability in Pomme de Terre River and is misleading and inconsistent with climate trends stated elsewhere."	The report referenced is one of many pieces of information included in the EAW, and all available information presented is evaluated to determine applicability to any decision. The DNR is re-evaluating the flow in the Pomme de Terre River as a part of their review of the water appropriation permit, and if a permit is authorized it is anticipated conditions would be included based on stream flow, including restrictions on appropriating water during the summer months. Additionally, DNR will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site.
270	Commenter states, "Managing and land-applying hundreds of millions of gallons of manure each year presents meaningful risks to nearby waterways if storage systems fail."	Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. The Project will reduce contamination risk from manure application to groundwater quality by following proper land application practices. The Proposer will follow requirements of Minn. R. 7020 and the MMP in the Feedlot Permit for manure application. Once the Project is operational and manure is being generated and transferred to farmers, the manure recipients will be required to follow the Feedlot Permit rules for land application of manure that requires: “field receiving manure shall be sampled and tested in the upper six inches for soil phosphorus at least once every four years”. Where field phosphorous tests levels are above 21 ppm Bray 1 or 16 ppm and have surface water within 300 feet, the Feedlot Permit requires that manure recipients apply manure at a rate and frequency that phosphorous applied does not exceed phosphorous removal during a six-year period or that there be a vegetated buffer along lakes, streams, or other waterways.
271	Commenters note there is documented evidence of historical levels of flooding in the area where the Pomme de Terre and Chippewa rivers united.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
272	Commenters are concerned about the impact from nutrient/manure runoff to nearby surface waters.	Please see responses to comment groups 252 and 274.
273	Commenter states, "Facilities of this magnitude in other states have literally displaced material human populations through their depletion of surface water bodies."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
274	Commenter states, "Managing and land-applying hundreds of millions of gallons of manure each year presents meaningful risks to nearby waterways if nutrients are over-applied."	Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. The Project will reduce contamination risk from manure application to groundwater quality by following proper land application practices. The Proposer will follow requirements of Minn. R. 7020 and the MMP in the Feedlot Permit for manure application. Once the Project is operational and manure is being generated and transferred to farmers, the manure recipients will be required to follow the Feedlot Permit rules for land application of manure that requires: “field receiving manure shall be sampled and tested in the upper six inches for soil phosphorus at least once every four years”. Where field phosphorous tests levels are above 21 ppm Bray 1 or 16 ppm and have surface water within 300 feet, the Feedlot Permit requires that manure recipients apply manure at a rate and frequency that phosphorous applied does not exceed phosphorous removal during a six-year period or that there be a vegetated buffer along lakes, streams, or other waterways.
275	Commenter states, "at least one problem is evident from the EAW materials that were made available. Riverview plans to install a drain tile system to “control seasonal subsurface saturation” near the 35.2 acres of liquid manure storage basins where Riverview proposes to store nearly 150 million gallons of additional liquid manure. This subsurface water will be diverted to one of the on-site storage basins and then released directly into the environment via a	To control potential seasonal subsurface saturation near the LMSAs, a drain-tile system will be installed around the perimeter of the LMSAs at an elevation below the LMSA liners as outlined in the Minnesota NPDES Individual Feedlot Permit (Feedlot Permit) application (Attachment 22). The clean seasonal subsurface water from the perimeter tile system will drain into a nearby stormwater basin, where it combines with Project stormwater. Clean stormwater does not encounter manure or feed storage areas. The Proposer will install an inspection port near the LMSAs to enable monthly visual inspections. After construction, the Proposer will ensure the drain-tile system is functioning correctly for each LMSA and look for signs of discoloration or odor that may indicate an issue with the liner. The clean

Comment Group	Comment	Response
	series of drainage ditches that ultimately flow to the Pomme de Terre River. "	seasonal subsurface water from the perimeter tile system will drain into a nearby stormwater basin, where it combines with Project stormwater.
276	Commenters are concerned about the impact the Project will have on the Pomme de Terre River.	Please see responses to comment groups 182, 251, and 266.
277	Commenters noted the Project is near the Pomme de Terre River and only 20-25 miles upstream from the confluence with the Minnesota River.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
278	Commenter states, "These rivers and waterways are crucial to the Midwest in being used to move goods."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
279	Commenter states, "These rivers and waterways are crucial to the Midwest in being used to provide jobs."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
280	Commenter states, "Surface water pollution: Runoff from feed storage areas increases the risk of phosphorus and nitrogen loading into nearby rivers, streams, and wetlands. This contributes to algal blooms, fish kills, and long-term ecosystem degradation."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. For the Feedlot Permit, all runoff from feed storage is collected and land applied.
281	Commenter states, "Surface water pollution: Runoff from manure storage increases the risk of phosphorus and nitrogen loading into nearby rivers, streams, and wetlands. This contributes to algal blooms, fish kills, and long-term ecosystem degradation."	The only potential runoff from manure storage is from the stockpile of separated solids that will be land applied. The Project will direct runoff from the feed storage and solid manure storage areas to an LMSA for land application.
282	Comments are related to a fish kill that occurred in southeast Minnesota along Rush Creek.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
283	Commenter is concerned that the Project is in a sandy area and that sandy soils are where surface waters can quickly reach the aquifer, similar to the karst region in southeast Minnesota.	Stevens County is not in a sandplains setting. In addition, karst topography is not known to exist within the vicinity of the Project or the manure application acres. The Project site geology consists of a layer of lean clay topsoil and fill soils underlain by various alluvial deposits with clay till present at depth. The surficial fill/topsoil layer organic lean clay, silty clay, sandy lean clay and lean clay. The main geologic deposit encountered at the Project site consisted of sandy lean clay, glacial till. From the soil borings and laboratory testing from the American Engineering Testing report, these sandy lean clay, fat clay, and lean clay soils are suitable for dike and liner construction of the proposed LMSA ponds. Please also see responses to comment groups 102, 149, and 182.
284	Commenter states, "What controls will you put on these open sewer lines to prevent it ending up in ground water or in the Mississippi River?"	Responding under the assumption that 'open sewer lines' is referring to the stormwater, then The Project will manage runoff in accordance with the Stormwater Pollution Prevention Plan (SWPPP) plan included with the Feedlot Permit application. Each stormwater basins are sized more than 20% larger than the minimum requirement. Since all stormwater is contained on the Project, impacts to nearby lands are not expected. Best Management Practices (BMPs) include: (1) Stormwater will generally not come into contact with feed, animals, manure, or bedding. Any contaminated runoff will not leave the Project site and (2) the feed piles will be covered with impermeable plastic on an asphalt feed pad to minimize rainwater contact with the feed. Stormwater from the feed pad and solid manure storage areas will flow to Facility 106 (Feed Storage Pad) and be contained in a Liquid Manure Storage Area (LMSA) preventing it from entering local waterways.
285	Commentors are concerned about spills from the site contaminating surface waters.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
286	Commenter states, "Rainwater run-off from roofs is another source of displaced water. With numerous huge buildings to house animals on that scale there will be ecosystem impacts from rainwater run-off."	The Proposer will install stormwater basins and modify the contour of the site to direct stormwater to stormwater basins. The Project will include physical landscape modifications, including removing topsoil and grading the site to meet the stormwater management plan.
287	Commenter is concerned why "clean" stormwater needs to be treated.	The process is similar to the required capture of precipitation in stormwater basins; however, instead of releasing the captured water, stormwater is used to offset the water pumped for cow consumption. This storm water is being collected to be used as a backup water supply, which is why it needs to be treated.
288	Commenter states, "Of note, Commenters are limited in their ability to assess impacts that would result from Riverview's stormwater management because the facility's Stormwater Pollution Prevention	The Proposer's application materials included a SWPPP for the project. The Permit public notice for the Project indicates; "A draft permit is available for review on the MPCA Public Notices webpage at https://www.pca.state.mn.us/get-engaged/public-comments. Additional materials relating to the issuance of this permit are available for inspection by appointment at any MPCA office

Comment Group	Comment	Response
	Plan was not included in materials made available for public comment."	(https://www.pca.state.mn.us/about-mpca/contact-us) between the hours of 8:00 a.m. and 4:30 p.m., Monday through Friday. The MPCA will mail or email a copy of the draft permit upon request."
289	Commenters are concerned the Project is a major threat to surface waters.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
290	Commenters are concerned the Project is a major threat to the local watershed.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
291	Commenter states the Project is on sensitive ground due to the presence of wetlands to the south of the site.	The Project site is designed to capture and reuse most or all of stormwater runoff, largely eliminating the untreated runoff that currently leaves the property.
292	Commenters state some of the land is tiled and request that the MPCA do an analysis of the tile lines.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
293	Commenter states, "Compliance with TMDL goals for areas surface waters are not acknowledged" in the EAW.	A Total Maximum Daily Load (TMDL) study identifies pollutants causing impairment and how much of those pollutants can enter the waterbody while still meeting water quality standards. Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state.
294	Commenters are concerned the Project will make lakes and streams swimmable and unfishable due to blue-green (toxic) algae blooms.	Nutrient overloads have been known to cause harmful algal blooms to surface waters. Manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features. To prevent surface water contamination and control potential seasonal subsurface saturation near the Liquid Manure Storage Areas (LMSAs), a drain-tile system will be installed around the perimeter of the LMSAs at an elevation below the LMSA liners. The clean seasonal subsurface water from the perimeter tile system will drain into a nearby stormwater basin, where it combines with Project stormwater. The proposed Project will include the retention, filtering, treatment and/or reuse of surface water runoff that would otherwise be directed downstream by existing drainage. Please also see response for comment group 268, and 330.

Comment Group	Comment	Response
295	Commenters make general statements about putting a high value on Minnesota's lakes and streams.	The Project will manage runoff in accordance with the Stormwater Pollution Prevention Plan (SWPPP) plan included with the Feedlot Permit application. Each stormwater basin is sized more than 20% larger than the minimum requirement. Since all stormwater is contained on the Project, impacts to nearby lands are not expected. Best Management Practices (BMPs) include: (1) Stormwater will generally not come into contact with feed, animals, manure, or bedding. Any contaminated runoff will not leave the Project site and (2) the feed piles will be covered with impermeable plastic on an asphalt feed pad to minimize rainwater contact with the feed. Stormwater from the feed pad and solid manure storage areas will flow to Facility 106 (Feed Storage Pad) and be contained in a Liquid Manure Storage Area (LMSA) preventing it from entering local waterways.
296	Commenter states, "What we know about wetlands is that they are a complex network of capillaries and underground water pathways that goes significantly beyond what we can see above ground."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
297	Commenter states, "Water quality for the whole state is currently being reviewed and new guidelines potentially coming forward. It would be wise to wait or at least look at the proposed new guidelines BEFORE granting a permit of this magnitude."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
298	Commenter states, "The Diocese of New Ulm is a fifteen county area. The Minnesota River runs diagonally through the area. How will the Riverview proposal affect the watershed feeding the Minnesota River?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
299	Commenter states, "The Minnesota Pollution Control Agency estimates that 56 percent of surface waters do not meet basic water quality standards."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
300	Commenters ask who will pay the increasing costs of road repairs?	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
301	Commenter requests, "Please do right by the civic infrastructure like roads."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
302	Commenter states, "Traffic and road maintenance and the impact on transportation adjacent water ways with increased emissions from trucking."	Minnesota Department of Transportation data indicates that Annual Average Daily Traffic (AADT) near the Project on Stevens County Road 8 is 520 vehicles. The Project would increase current traffic counts by an estimated total of 45 vehicles per day. Therefore, the traffic on Stevens County Road 8 would increase by up to 8.7%, and the potential for traffic congestion is considered low. No improvements to County Road 8 are considered necessary to accommodate this increase in traffic. Vehicle emissions from construction equipment (1,915 tons/year) and additional Ag equipment (1,626 tons/year) have been accounted for within the EAW in attachment 21.
303	Commenter states, "Will local farmers haul more grain to the dairy, so ethanol plants will have to buy corn from farther away, increasing the need to repair roads in the region?"	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
304	Commenters state the Project will increase traffic.	Minnesota Department of Transportation data indicates that Annual Average Daily Traffic (AADT) near the Project on Stevens County Road 8 is 520 vehicles. The Project would increase current traffic counts by an estimated total of 45 vehicles per day. Therefore, the traffic on Stevens County Road 8 would increase by up to 8.7%, and the potential for traffic congestion is considered low. No improvements to County Road 8 are considered necessary to accommodate this increase in traffic.
305	Commenter states, "It appears that very little of the existing infrastructure will be used to support this proposed project."	There will be no modifications to existing equipment or industrial processes. There will be no significant demolition, removal, or remodeling of the adjacent Existing Facility. There are no existing structures within the Project site. The construction of the Project will take place on undeveloped land and will include a barn, holding pen, parlor, feed storage pad, manure storage, loading areas, and water supply.
306	Commenters are concerned with damage to roads due to manure hauling.	Manure applications will be performed using drag hoses, which minimize road traffic from manure application equipment. The Proposer will develop and utilize an underground manure transfer line. The underground manure line system transports manure from the dairy to a field, typically in the middle of the field. This results in less impact on local infrastructure and a minimized risk of manure spills from overland transport.
307	Commenter states, "The above only touches on the water impacts, there is also road/traffic impacts that need to truly be evaluated."	Minnesota Department of Transportation data indicates that Annual Average Daily Traffic (AADT) near the Project on Stevens County Road 8 is 520 vehicles. The Project would increase current traffic counts by an estimated total of 45 vehicles per day. Therefore, the traffic on Stevens County Road 8 would increase by up to 8.7%, and the potential for traffic congestion is considered low. No improvements to County Road 8 are considered necessary to accommodate this increase in traffic.
308	Commenters stated that truck traffic increased the damage to the roads.	The Project will generate approximately 58 semi loads of milk per week to a cheese processing plant. Suppliers will deliver an average of 21 loads of feed to the Project each week. The Project will operate

Comment Group	Comment	Response
		seven days a week. Most heavy trucks will exit the Project site via 520th Avenue and turn north onto Stevens County Road 8. The Proposer will complete road improvements on 520th Avenue between County Road 8 and the Project location to accommodate increased heavy-traffic use and any damage caused by this. Please also see response to comment group 306.
309	Commenter states, "Traffic and road maintenance and the impact on transportation adjacent water ways with increased salt/sand.."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
310	Commenters state that the animal feedlots generate 5 tons of manure per for every man, woman, and child in the U.S.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
311	Commenters note the EAW says it takes 13,200 acres of cropland per year for land application of the manure	Local producers have identified and offered 16,669 acres of currently tilled cropland for manure application. With the expansion Project, West River Dairy expects to utilize approximately 13,200 acres per year. Manure can be used to replace or supplement commercial fertilizer. The Proposer will begin manure application following corn silage harvest starting around September 1 every year.
312	Commenter claims a 20,000-cow dairy will require 30 square miles of land to absorb their manure.	The Proposer established an ERA which includes sufficient manure acres for the Project and the Existing Facility and has over 3,000 additional acres extra to account for possible unknowns with manure production and application. These designated manure acres are not only established in this EAW, but they will also be reported in the Nutrient Management Plan that is submitted to the MPCA. The individual NPDES permit and associated Nutrient Management Plan.
313	Commenter states, "The EAW fails to adequately evaluate whether the surrounding cropland can consistently and safely absorb the Expansion Project's manure supply."	As required by the MPCA, the Proposer will sample soil from manure application fields every 4 years to monitor phosphorus (P) levels, using the Olsen or Bray P1 analysis. The Proposer will also use the Manure Management Plan (MMP) resources to prevent long-term soil P build-up. The steps in the MMP are to: determine crop P uptake, determine manure P level, determine the amount of P applied from commercial fertilizer, and compare the amount of P applied and removed. The Proposer can adjust the amount of manure applied or commercial fertilizer applied or adjust the crop rotation to prevent long term phosphorus build-up. The Project is required to comply with Minn. R. ch. 7020 and applicable Feedlot Permit conditions governing nutrient (manure) application, which address manure in combination with other nitrogen sources, including commercial fertilizer, residual manure from prior years, irrigation water, and nitrogen from legumes. The Project's nutrient management plan helps establish agronomic application rates by ensuring that estimated plant-available nitrogen does not exceed crop nitrogen demand for non-legume crops or nitrogen removal for legume crops. This provides a crop-based framework for matching manure application rates to intended crops and reducing excess nutrient application.

Comment Group	Comment	Response
		To further support appropriate nutrient management and limit nitrate leaching potential, the permit requires implementation of nitrogen best management practices based on timing and field conditions. These include applying manure to actively growing crops where appropriate, using cover crops, applying nitrogen stabilizers such as nitrapyrin, delaying application until soil temperatures are at or below 50 degrees for two consecutive days, incorporating crop rotations that include perennial crops for two years within a five-year period, and using reduced-rate split nitrogen applications. In addition, land application activities are subject to discharge prevention and monitoring requirements. Except where the federal agricultural stormwater exemption applies, the NPDES permit does not allow discharge from land application. When manure is applied during non-winter conditions, it must be injected or immediately incorporated if a greater than 50 percent probability of at least 0.5 inches of rainfall is forecast within 24 hours after application (unless under emergency conditions). Fields receiving manure must also be visually inspected at downgradient field edges and other potential discharge points, including tile intakes, ditches, and sensitive features, with inspections conducted daily during application, at completion, and following qualifying rainfall events within 14 days. Any observed discharge must be addressed and reported under permit requirements.
314	Commenter states, "these feedlots are not the only users of these resources. Area farms not associated with West River also apply either manure or fertilizer to virtually every field that is farmed in the area."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
315	Commenter states, "These feedlots are not the only users of these resources. Area farms not associated with West River also apply either manure or fertilizer to virtually every field that is farmed in the area."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
316	Commenter states, "Although a good argument is made for decreased use of chemical fertilizers by spreading manure, it seems that the impact of increased ammonia into the air and ground have been overlooked."	The modeling results suggest that the proposed West River Dairy expansion will not create ammonia concentrations at its property lines that exceed the acute ammonia iHRV. AERMOD calculated a maximum hourly property-line ammonia concentration of 1,861 µg/m3. When a background concentration of 148 µg/m3 is added to the AERMOD-calculated concentration, the maximum property-line ammonia concentration is 2,009 µg/m3, which is below the acute ammonia iHRV of 3,200 µg/m3. Thus, no exceedance of the acute ammonia iHRV was modeled at the property lines for the expanded dairy. The AERMOD results indicate that the expanded dairy will not create ammonia concentrations at the neighboring residences that exceed the chronic ammonia iHRV. The calculated maximum one-year time average ammonia concentration for the neighbors is 9.39 µg/m3. When a

Comment Group	Comment	Response
		background ammonia concentration of 5.72 µg/m3 is added to the AERMOD concentration, the maximum annual ammonia concentration for a neighboring residence is 15.11 µg/m3, which is below the chronic ammonia iHRV of 80 µg/m3. Thus, the AERMOD modeling results for the proposed West River Dairy expansion suggest compliance with the hydrogen sulfide air quality standard, no exceedances of the subchronic hydrogen sulfide iHRV, no exceedances of the acute ammonia iHRV, and no exceedances of chronic ammonia iHRV. See EAW item 17.A.2. Land application of manure provides farmers with a nearby source of organic fertilizer that would otherwise require chemical or synthetic fertilizers, such as ammonia. Having this nearby source of fertilizer in the form of manure from the Project reduces GHG emissions associated with synthetic fertilizer production. The manure generated by the Project will replace approximately 1,545 tons per year of anhydrous ammonia. The regional overall GHG emission factor for ammonia production by the Haber-Bosch process is about 5.85-ton CO_2/ton NH_3. Thus, the use of manure generated by the Project as fertilizer will reduce GHG emissions by an estimated 9,038 tons of CO_2/year, because the corresponding mass of anhydrous ammonia is no longer produced.
317	Commenter states, "Huge animal confinement systems in the USA use and misuse antibiotics on a huge scale, three to six times more than European farmers."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
318	Commenter states, "Although a good argument is made for decreased use of chemical fertilizers by spreading manure, it seems that the impact of increased release of anti-pathogenic chemicals (antibiotics, hormones, etc.) into the air and ground have been overlooked."	According to the University of Wisconsin Extension (Fall 2011) Publication, Assessing the Potential Effects of Hormones in Livestock Manure, hormones were found to be rapidy degraded in stormwater runoff, which suggests minimal impact on aquatic organisms, and efforts that prevent manure from entering waterways will likely prevent hormones from entering surface waters. “
319	Commenter states, "Anti-Degradation and Downstream Impacts: As the Minnesota River system is already impaired in many reaches, additional upstream nutrient loading may contribute to downstream degradation. *MPCA should evaluate this project under anti-degradation standards, ensuring it does not contribute to further impairment."	Antidegradation is in Minn. R. Ch. 7050 and applied to point source discharges and new discharge locations in surface waters. There are no point source discharges with the Project.

Comment Group	Comment	Response
320	Commenter would like to know the proven life expectancy of manure storage basin like those proposed at West River Dairy?	NPDES feedlot permits don't define a numerical life expectancy for manure basins, but they do require that basins be designed, maintained, and operated to remain compliant and functional until they are no longer suitable for use, at which point they must be closed and replaced. The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and Permit. Note that LMSA operations and maintenance is required. Also, there will be no agitation needed due to separated solids increasing the longevity of liner integrity.
321	Commenters state, "Alleged best management practices of large confinement systems fail, not just in Minnesota but around the USA."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
322	Commenters state, "Given that the manure from the cows will be used as fertilizer on fields that will supply alfalfa for the cows, what are the long-term consequences of this closed-circuit consumption? ."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
323	Commenters state, "The nutrient load from manure on the lands surrounding the facility will likely be disproportionate, with closer locations receiving more inputs than locations farther away, as a function of transport cost and equipment abilities."	The Project is required to follow Minn. R. ch. 7020 and Feedlot Permit requirements relating to application of nutrients (manure) generated from the Project in combination with other nutrient sources. Potential sources of N include: commercial fertilizer, manure applied during the current crop year, manure applied during the previous crop year, irrigation water, and legumes grown during previous years. The Project's nutrient management plan describes how manure in combination with other nutrient sources will be applied at agronomic rates. N rates must be limited so that the estimated plant-available nitrogen (N) from all N sources does not exceed the expected crop N needs for non-legume crops or the expected N removal for legume crops. To further minimize the potential for nitrate leaching into the groundwater, the Feedlot Permit requires the Project implement N BMPs based on the timing of manure application and field location. Potential BMPs requirements include: application to actively growing crops, planting cover crops, use of a nitrapyrin-based nitrogen stabilizing product, delaying application until soil temperature as reached 50 degrees or less for two consecutive days, crop rotations that include growing perennial crops 2 years during any 5-year period and reduced rate split N applications.

Comment Group	Comment	Response
		Minn. R. ch. 7020 and Feedlot Permit requirements relating to application of nutrients (manure) generated from the Project in combination with other nutrient sources. Potential sources of N include: commercial fertilizer, manure. When manure from the project is transferred the manure recipient must comply with the manure management plan completed by the owner of the animal feedlot where the manure or process wastewater was produced and complete the manure management plan.
324	Commenters states, "AS alarming as water use is, even worse is a request to apply over 200 million gallons of manure on coarse textured ground."	The Project's application materials included Nutrient Management Plan (NMP). The plan identifies sensitive areas, including coarse textured soils, within or adjacent to land where manure application is planned. The Project's NMP identified 5,240 acres for land application of manure. Of the 5,240 acres approximately one (1) is identified as course textured soil. The NMP also indicates that manure from the Project will be transferred to other landowners. Prior to transferring manure, the permit requires the Permittee to provide manure recipients with a sensitive features map for each field where the transferred manure will be applied. The sensitive features map shall be developed using MPCA's online NMT service or MPCA's Interactive Nutrient Management Planning Map.
325	Commenters believe West River Dairy should compost their manure but notes that doesn't fit within their expansion model.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
326	Commenters believe that this is too much manure concentrated in one area.	Manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features. Several practices are required by the Feedlot Permit to prevent nutrient runoff that include application at agronomic rates to not exceed expected crop nitrogen needs, testing for soil phosphorus, application timing, planting cover crops, and setbacks from waterways. The Proposer will comply with manure application requirements set forth by the Feedlot Permit that are intended to protect waters of the state. Liquid Manure Storage Areas (LMSA) and Dry Manure Storage are the locations where manure is stored on the feedlot facility site. The individual NPDES feedlot Permit and manure management plan incorporates manure storage, transfer, and land application requirements that exceed those in the NPDES General Feedlot Permit, including 5 feet of compacted clay liner of LMSAs, synthetic covers and installation of a perimeter drain-tile system will

Comment Group	Comment	Response
		be at an elevation below the liner of each of the three LMSAs to control seasonal sub-surface saturation, and operation and monitoring and reporting requirements pertaining to freeboard of the LMSA. Manure from cattle in the free-stall barn will be collected twice daily using a self-propelled vacuum wagon. Solid manure will be stored on a concrete pad. Solid and liquid manure transferred to area farmers for use as fertilizer will be applied in accordance with Feedlot Permit requirements. The Proposer will install stormwater basins and modify the contour of the site to direct stormwater to stormwater basins.
327	Commenters state, "I was surprised to learn that it is raising the feed that often causes more of a nitrogen problem. Corn, a major feed component of dairy cows, is a monoculture crop. When nitrogen is applied, its easily overapplied."	The Project is required to follow Minn. R. Ch. 7020 and Feedlot Permit requirements relating to application of nutrients (manure) generated from the Project in combination with other nutrient sources. Potential sources of N include commercial fertilizer, manure applied during the current crop year, manure applied during the previous crop year, irrigation water, and legumes grown during previous years. The Project's nutrient management plan describes how manure in combination with other nutrient sources will be applied at agronomic rates. N rates must be limited so that the estimated plant-available nitrogen (N) from all N sources does not exceed the expected crop N needs for non-legume crops or the expected N removal for legume crops. To further minimize the potential for nitrate leaching into the groundwater, the Feedlot Permit requires the Project implement N BMPs based on the timing of manure application and field location. Potential BMPs requirements include application to actively growing crops, planting cover crops, use of a nitrapyrin-based nitrogen stabilizing product, delaying application until soil temperature as reached 50 degrees or less for two consecutive days, crop rotations that include growing perennial crops 2 years during any 5-year period and reduced rate split N applications.
328	Commenters state, "the EAW does not provide a field-by-field nutrient balance, distance-weighted transport analysis, or average and maximum manure movement distances. "	Manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features. Field application information can be found in the Manure Management Plan (attachment 23).
329	Commenters ask, "Can they disperse it [manure] beyond the county? "	Manure will be applied according to the individual NPDES feedlot permit and manure management plan for the facility. This includes application of manure on available 13,200 acres (Project and existing facility). All permitted manure application sites are within Stevens County.
330	Commenters state, "Crop land used for manure spreading may need containment to avoid runoff reaching surface waters. "	Manure will be applied according to the individual NPDES feedlot permit and manure management plan for the facility. This includes application of manure on available 13,200 acres (Project and existing facility) All permitted manure application sites are within Stevens County.

Comment Group	Comment	Response
331	Commenters state that the EAW does not adequately address the cumulative impacts of manure application from all of the feedlots in the watershed.	Cumulative potential effects are summarized in section 21 of the draft EAW and are generally related to overlapping manure application and excess water usage within the same Environmentally Relevant Area (ERA) by other similar projects. The Proposer established an ERA which includes sufficient manure acres for the Project and the Existing Facility and has over 3,000 additional acres extra to account for possible unknowns with manure production and application. These designated manure acres are not only established in this EAW, but they will also be reported in the Nutrient Management Plan that is submitted to the MPCA. The individual NPDES permit and associated Nutrient Management Plan.
332	Commenters ask, "Who will supervise all that data?"	The MPCA requires Feedlot Permit holders sample manure yearly. This sample must be representative and follow the University of Minnesota Extension Service recommendations and be analyzed at a Minnesota Department of Agriculture certified lab. The Proposer will take representative samples each year and send them to a local laboratory and make these results available to all manure recipients.
333	Commenters state, "Those of you reading this and making the decision to allow the equivalent feces of about 250,000 people just upriver of where we live along the southern Pomme de terre river do NOT live there, nor do your children and grandchildren. "	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
334	Commenters state, "Riverview's expansion would more than double its liquid manure storage capacity in Morris, from 102 million gallons to 250 million gallons."	Expanding liquid manure storage capacity is a necessary and appropriate response to the growing head count.
335	Commenters ask what will happen when adverse conditions require emergency situations caused by weather events.	Manure storage capacity has been designed with a 14-month capacity. This is greater than the minimum required storage capacity of nine months to prevent the potential for an emergency winter application situation. This additional contingency storage allows operational flexibility to apply in the spring and summer months and avoid winter application if fall weather conditions are not conducive to applying all manure before winter. However, if an emergency winter application was necessary, the Proposer would not apply manure to any fields with slopes greater than 6%. Fields with this condition make up a small portion of the total acres dedicated to the Project. The Proposer has a contract with Environmental Scientific as a contingency plan. Environmental Scientific will promptly notify the Minnesota State Duty Officer and work with the appropriate agencies to mitigate any contamination, hazardous materials, or waste.

Comment Group	Comment	Response
336	Commenter is concerned about the noxious gases produced in the storage pits.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
337	Commenters state, "There is also concern about how the guidelines for manure spreading are enforced when it is being done by outside partners on fields that are not controlled by the permit seeker."	Minn. R. Ch. 7020 and Feedlot Permit requirements include requirements relating to manure application in general and the transfer of manure. Minn. R. Ch 7020 requires that manure is applied in a manner that does not result in discharge to waters of the state during the application process or cause pollution of waters of the state due to manure contaminated runoff. When manure from the Project is transferred the manure recipient must comply with the Project's nutrient management plan (NMP). While Permittees do not control the ultimate actions of manure recipients, Permittees are required to include in their NMP protective measures a recipient must follow to ensure manure is applied in a proper manner. In this context Permittees do have responsibility for manure they transfer. The MPCA is the regulatory authority for the Project and manure applications relating to the project. The Minnesota Department of Agriculture provides oversight and requires training and licensing for Commercial Animal Waste applicators.
338	Commenters state, "Excessive concentrated gastly waste managment can not creep into Minnesota."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
339	Commenters state, "Manure Storage Risk and Extreme Weather: While the proposal includes lined manure storage basins, extreme precipitation events are increasing in frequency and intensity. Overflow or application during saturated conditions could result in significant nutrient releases. * I request evaluation of climate-adjusted storage capacity and land application timing safeguards."	The Liquid Manure Storage Area (LSMA) liners are permitted and regulated under the individual NPDES Feedlot Permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and this Permit. The permittee will also operate the LMSA to maintain freeboard and install visual markers to inspect freeboard of the LMSA. The LMSA will have three feet of freeboard, greater than one-to-two-foot standard, along with covers, both will prevent overflows. The available acres that could receive manure may or may not be available in any given year based on many factors, including, but not limited to, the desire by both parties involved to apply manure, crop rotation, and weather. There are time and weather-dependent BMPs and permit conditions that must be adhered to. These include, among other things, cover crops, nitrogen inhibitors, and adequate soil temperatures.
340	Commenters state, "The manure is applied largely in the fall when it has the greatest potential to leach nitrates into surrounding wells and waterways before it can be utilized by crops 6 months later in the summer."	The Proposer will begin manure application following corn silage harvest starting around September 1 every year. The Commercial Animal Waste Technician (CAWT) will land apply manure 24 hours a day, 6 days a week for approximately 30 days each year. Due to factors such as rain events or waiting on fields to become available for application, the CAWT may need to spread out the manure application over several weeks. No manure will be applied on Sundays. Manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will

Comment Group	Comment	Response
		use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features.
341	Commenters state, "If 3,000 acres of prospective manure application fields have known drainage issues that will not be identified and remedied until after some future rain events this should be a red flag."	The nutrient management plan for the Project identifies sensitive features within or near land application areas where manure application is planned. Additionally, prior to transferring manure to a manure recipient, the feedlot Permit requires the permittee to provide manure recipients with a sensitive features map for each field where the transferred manure will be applied. The sensitive features map shall be developed using MPCA's online NMT service or MPCA's Interactive Nutrient Management Planning Map. Additionally, Minn. R. Ch. 7020 and the permit require that manure is not applied in a manner that exceeds the hydraulic loading capacity of the land application site based on soil conditions.
342	Commenters state, "The Feedlot Rules Plainly Require Feedlot Applicants To Describe Methods And Practices For Minimizing GHG Emissions An applicant for a feedlot or manure storage area capable of holding 1,000 animal units or more must submit an Air Emission Plan. That Plan must include "methods and practices that will be used to minimize air emissions resulting from animal feedlot or manure storage area operations including manure storage area start-up practices, loading, and manure removal.""	Currently, there are no federal or Minnesota thresholds of Greenhouse Gas significance for determining the impacts of Greenhouse Gas emissions from an individual project on global climate change. The air emission plan is recorded in the facilities permit application and copy of record that satisfies the requirements of Minn. Rule 7020.0505 subp. 4.B (1). Item 18.B.1 of the EAW includes several methods for minimizing or mitigating GHG emissions.
343	Commenters state, "Riverview has done everything in the past to apply the manure in a safe and responsible manner. If there was a issue, it was taken care of. Manure is not so much a waste product but a commodity, it is beneficial to the fields it is applied to and the farmers using it."	Thank you for your comment.

Comment Group	Comment	Response
344	Commenters state, "The EAW does not consider how leaks from the hoses it uses to pump waste to these fields could impact water quality, nor are there monitoring requirements to ensure any such leaks are discovered and stopped in a timely manner."	The Proposer will keep written documentation for the operation, maintenance and inspection of the Manure Storage Basin Area and related components as required by the Feedlot Permit. Corrective measures taken will be documented. Parcels receiving manure will be monitored and inspected by the operator of manure application to maintain proper operation of all distribution equipment. In the event of an unplanned discharge, the Proposer will take necessary corrective action promptly. Corrective actions will be documented and made available for inspection by the MPCA if requested. All records will be kept by the Proposer for five years. Any discharge will be reported to the MPCA as required by the Feedlot Permit. To apply manure at the correct agronomic rates, the CAWT will use pressure gauges and flow meters on each applicator. A monitor in the tractor cab displays the rate of manure application (flow), the pressure of the hose (pressure), and the revolutions per minute (RPM) of each engine pumping manure. If any malfunction were to occur such as a hose break, the monitor in the tractor cab immediately detects change in flow, pressure, and RPM. The CAWT can shut down the entire system, closing shutdown valves at the main pump and subsequent booster pumps. Additionally, each pump has an automatic shutoff mechanism should hose pressure exceed or fall below predetermined operating levels.
345	Commenters ask, "How can it be possible to spread these millions of gallons of manure in a timely fashion?"	The Proposer will install three basin containment systems to store liquid manure, covering 35.2 acres. The Liquid Manure Storage Area (LMSA) will have a capacity that will exceed the nine-month minimum requirements by providing 14 months of liquid manure capacity. The Proposer expects to store liquid manure for approximately 21 months each year until it is land applied. The Proposer executes manure application by a dragline hose system. Per the Manure Management Plan, the amount manure is defined under Manure Source Summary, and the fields receiving manure are shown in the Field Map Summary. Specific details including application rate, application method, and planned manure application timing are also included in the Manure Management Plan.
346	Commenters ask how and where all the manure will be disposed?	Liquid and solid manure will be collected, stored, processed, and land applied as fertilizer on cropland according to the associated NPDES permit and Nutrient Management Plan. Local producers have identified and offered 16,669 acres of currently tilled cropland for manure application. The Proposer expects to utilize approximately 13,200 acres per year. The manure application sites are within: Stevens County (Baker, Darnen, Horton, Synnes, and Scott Townships) and Swift County (Hegbert and Fairfield Townships) as shown in EAW Attachment 5 and Attachment 8. The manure application sites are currently cultivated for crop production, and landowners may have used the fields for manure application in the past. The Proposer will develop and utilize an underground manure transfer line. The underground manure line system transports manure from the dairy to a field, typically in the middle of the field. The Proposer then executes manure application by a dragline hose system. The

Comment Group	Comment	Response
		Proposer pumps manure from the Project through a series of hoses overland to reach application fields. This system provides flexibility in the number of available routes to reach manure application fields. It also greatly reduces the impact of manure application equipment on local road infrastructure. The Commercial Animal Waste Technician (CAWT) may land apply manure in the fall, spring, or summer if there is an existing crop on the applicable site. The CAWT will inject the manure directly into the soil when cover crop is not present. The CAWT must follow County ordinances and setbacks for manure applications at each manure application site. The CAWT must also adhere to applicable manure application setbacks as outlined in Item 12.B.5 of the EAW. The Feedlot Permit requires operations and maintenance of manure transport equipment to prevent leaks and breaks and requires immediate notification and response should equipment failure occur.
347	Commenter states, "Although a good argument is made for decreased use of chemical fertilizers by spreading manure, it seems that the impact of increased hydrogen sulfide into the air and ground have been overlooked."	Hydrogen sulfide (H_2S) and ammonia are odorous gases. These types of emissions are common on dairy farms. The Proposer contracted with Barr Engineering to conduct air dispersion modeling to predict how the Project's air emissions of hydrogen sulfide, ammonia, and odors would impact air quality at the Project's property lines and at the nearest residences. The modeling found that the Project will not create exceedances of the Minnesota Ambient Air Quality Standard or Sub-chronic Inhalation Health Risk Value (iHRV) for Hydrogen Sulfide. The highest concentration found at the property lines of the nearby residences was 12.44 ppb and which is below MN air quality ambient standard of 30 ppb; 17 ppb background is primarily representative of H_2S emissions that result from land application of manure along with other sources such as wetlands. The modeling confirmed that the Project would have no negative impacts on air quality and would not impact nearby residences. Please also see response to comment group 274.
348	Commenter states, "When they manure pumping crews are mainly made up of Hispanics and South Africans who's primary language isn't English it's hard to follow rules and directions."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
349	Commenters make the general statement that CAFOs are historically known to be bad for the environment.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
350	Commenter asks, "The other side of this debate is manure storage. This may sound good but it all has to be disposed of and that much manure will have to impact the	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
	water supply in the future. What will be the options then?"	
351	Commenter states, "I don't think we should be bearing the costs of this mega CAFO. Their manure plan is not adequate. I live near Minnesota River and can see the impacts of current nutrient load and hydrology."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7. Additionally, MPCA reviewed the Project's NMP and found it meets feedlot rule and permit requirements.
352	Commenters are concerned about increasing pollution from manure, including chemicals in the manure.	Please see responses to comment groups 102, 252, and 274.
353	Commenters state that all manure pits and lagoons leak.	The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and Permit. Should a spill of hazardous material occur the Proposer has a contract with Environmental Scientific as a contingency plan.
354	Commenters are concerned that when you take the theoretical seepage rate of the basin liners and multiply the impact compared to a 280 head dairy.	The Proposer will construct proposed earthen lined manure storage areas with 5 ft compacted clay liners. The LMSA design requirements in rule and the Feedlot Permit, along with enhanced liner thickness will reduce theoretical seepage and provide greater groundwater protection.
355	Commenters want to know what type of monitoring there is for leaks in the liner?	The Liquid Manure Storage Area liners are permitted and regulated under the individual NPDES feedlot permit associated with this facility. A monthly examination of the monitoring port or drain tile outlet for water flow and signs of discoloration or odor in any water flowing in the drain tile. A weekly visual inspection of the LMSA and any devices channeling manure-contaminated runoff to the LMSA to assess conformance to the approved plans and this Permit.
356	Commenters ask for an in-depth long-term analysis of the nutrient/nitrate loading from manure applications and their impact on the soils and waters (ground water and surface waters) of the surrounding area.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
357	Commenter states, "Current manure handling should be re-considered in all your decisions, statewide."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
358	Commenter states, "I believe it is important to protect the environment by ensuring proper manure management."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
359	Commenter states, "Problems with these massive dairy operations center around manure."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
360	Commenter states, "I also heard that they claim all the manure will be stored on site... If they consider stored on site to mean in fields such as the one next to our property, then I know that means they will locate a giant pile of manure right in the path of someone's place."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
361	Commenter states, "This project will need 250 million gallons of liquid manure storage waste."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
362	Commenter states, "Agronomic application rates are not designed to prevent excess nutrients or other farm chemicals from reaching groundwater, instead they are designed to maximize production with the least amount of application."	Anyone who land applies manure in Minnesota must comply with the requirements of Minnesota Rules, chapter 7020, which are designed to protect surface water and groundwater. Feedlots operating under a National Pollutant Discharge Elimination System (NPDES) or State Disposal System (SDS) permit are subject to additional manure management requirements. Under Minn. R. Ch. 7020, manure application rates are limited to the amount of plant-available nitrogen needed by the crop, generally following University of Minnesota Extension recommendations. Permittees must use the MPCA's Minnesota Nutrient Management Tool to develop and maintain a Manure Management Plan (MMP), which determines allowable application rates based on manure nutrient content, crop needs, and residual nitrogen from previous applications. The MMP incorporates permit requirements governing manure application rates, nitrogen and phosphorus management, application timing, inspections, and setbacks. These measures are intended to minimize the risk of surface water and groundwater contamination from land application of manure. The permittee and all manure recipients must comply with the MMP and all applicable

Comment Group	Comment	Response
		permit requirements. The Nutrient Management Tool satisfies applicable manure management planning requirements under Minn. R. 7001.0150 and Minn. R. 7020.2225.
363	Commenter states, "Although a good argument is made for decreased use of chemical fertilizers by spreading manure, it seems that the impact of increased methane into the air and ground have been overlooked."	Attachment 21 includes CO_2e emissions breakout. Enteric fermentation emissions account for 1,697 tons/year. Methane emissions associated with manure storage are 700 tons/year.
364	Commenter states, "I am fully aware that additional delay could have some economic impact upon Riverview. So would an environmental disaster. From the presentation at the public meeting, I am aware that the proposed application includes certain provisions designed to mitigate negative environmental impacts of the feedlot. I am not knowledgeable as to whether the mitigation efforts are state of the art, but I am assuming they probably are."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
365	Commenter states, "Future generations will be rolling in shit. Thanks a lot, MPCA! You knew what you were doing."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
366	Commenter states, "I heard that this liquid manure is tested once a year? Well, I don't think testing this liquid manure once a year is enough, because I imagine there could be some variations over the course of the year which could impact testing results."	The MPCA requires Feedlot Permit holders sample manure yearly. This sample must be representative and follow the University of Minnesota Extension Service recommendations and be analyzed at a Minnesota Department of Agriculture certified lab. The Proposer will take representative samples each year and send them to a local laboratory and make these results available to all manure recipients. Following laboratory analysis of manure samples, the Proposer will determine the agronomic rate using the University of Minnesota's recommendations for manure application based on the previous crop harvested, the available nutrients, yield goals, and the crop grown. Manure applications occur a single time per year per application site. The Proposer anticipates sufficient time is available from September 1 until freeze to apply all the manure while also factoring in unexpected downtime due to weather conditions. Typically, the Proposer will only

Comment Group	Comment	Response
		apply manure in the spring if the weather conditions during the previous fall prevented complete emptying of the LMSAs.
367	Commenters ask if the manure can be land applied without increasing the risk of nitrate pollution	Best Management Practices (BMPs) will be adhered to with this Project to limit the potential for nitrate impacts on water resources including manure which will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. The Feedlot Permit includes nitrogen BMPs to mitigate N loss to waters.
368	Commenter states, "The manure runoff would lead to increased nitrates and phosphorus."	Land application of liquid and solid manure will be regulated under the individual NPDES permit and associated Nutrient Management Plan which includes nitrogen BMPs to minimize nitrate leaching and runoff. As required by the MPCA, the Proposer will sample soil from manure application fields every 4 years to monitor phosphorus (P) levels, using the Olsen or Bray P1 analysis. The Proposer will also use the Manure Management Plan (MMP) resources to prevent long-term soil P build-up. The steps in the MMP are to: determine crop P uptake, determine manure P level, determine the amount of P applied from commercial fertilizer, and compare the amount of P applied and removed. Manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied.
369	Commenters are concerned about the odor that will be created by Project.	The maximum hourly odor concentrations along the Facility's property lines were below the "moderate" odor threshold of 244 OU, except for one hourly exceedance along the near-south property line. The maximum odor concentration for the near south property line was 260 OU. The calculated hourly odor concentration at any property-line receptor was less than or equal to the "faint" odor threshold of 83 OU at least 99.67 percent of the time.
370	Commenter states, "Also, the manure application initially and for the first few days--greatly affects the air quality making breathing it unpleasant at best. This seems to be caused by the applicators which when turning at the ends of the fields, raise above the dirt and spread the liquid on top of the ground."	The Proposer executes manure application by a dragline hose system. The Proposer pumps manure from the Project through a series of hoses overland to reach application fields. This system provides flexibility in the number of available routes to reach manure application fields. The Commercial Animal Waste Technician (CAWT) will inject the manure directly into the soil when cover crops are not present.
371	Commenters make the assertion that all farmers over-apply manure.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
372	Commenters make the assertion that all manure pits overflow, which will be made worse by the increase in severe weather events.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
373	Commenters state that the Proposer does not have a good record of liquid waste management.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
374	Commenter states, "Contamination by manure seepage to perimeter tile draining shallow groundwater from under manure pits delivered to storm water basin is unaccounted for."	The risk of contamination of groundwater quality due to the Liquid Manure Storage Areas (LMSAs) is low given the two engineered concrete structures and three clay-lined design for the Project. Because the earthen LMSAs are being constructed with 5 feet compacted clay liners, the theoretical seepage rate that will be achieved will be more protective than the 1/56 required in rule. Based on review of the boring logs as well as the results of the laboratory tests, the clay soils encountered in the borings are suitable for use as liner material. The results of the laboratory tests indicate these soils should satisfy the recommended seepage rate of less than 1/56 inch per day at maximum operating depth if placed at the recommended compaction and moisture specifications. The Proposer may encounter shallow groundwater during construction of the LMSAs. The Proposer will install a perimeter drain-tile system at an elevation that is lower than the liner within the LMSA to reduce external groundwater pressure on the walls and to control seasonal subsurface saturation near the LMSAs. The Proposer will install an inspection port near the LMSAs to enable monthly visual inspections. After construction, the Proposer will ensure the drain-tile system is functioning correctly for each LMSA and look for signs of discoloration or odor that may indicate an issue with the liner. These items are included in the in the Minnesota NPDES Individual Feedlot Permit.
375	Commenters are making policy statements concerning the regulation of the handling of animal waste.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
376	Commenter states, "Unless this dairy can provide sustainable waste product processing, it is an extremely bad idea for Minnesota environment."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
377	Commenter states, "This is a profit-driven proposal for concentration of cows that would make it unlikely that considerations about manure run-off would be part of the operation."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
378	Commenter states, "We need to reverse the way that animals are managed on the landscape in order to reintegrate their waste safely into the ecosystem."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
379	Commenter states, "The Minnesota legislature granted the MPCA the authority and resources to develop nitrate standards to protect aquatic life uses for the state's surface waters and regulate non-fertilizer sources of nitrates (primarily manure) from large feedlots decades ago but the agency has not completed the necessary rulemaking to implement this authority."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
380	Commenter states, "There certainly is a problem with millions of gallons of manure application in such a small area – application that is limited by season."	There are 16,669 manure acres designated for the Project for land application. Manure application is a predictable seasonal activity, typically occurring in the fall of the year. All manure application sites identified by and offered by local producers for the Project are on land that is already in crop production and typically fertilized annually. Please also see response to comment group 68, 323, and 326.
381	Commenter states, "Simply eliminating these areas [with drainage issues] from future manure application after the drainage problem has been experienced will not prevent this pollution."	Manure application is generally prohibited within 300 feet of a drainage ditch unless specific runoff protection measures are used. Compliance may be achieved through a combination of protective berms, setbacks with manure injection or incorporation and phosphorus management, vegetated buffers with increased setbacks, or a 50-foot perennial vegetated buffer where no manure is applied. (Minn. R. 7020.2225)
382	Commenter states, "The Proposer has agreements with landowners for manure application covering over 16,500 acres. Depth to groundwater will vary throughout these acres. There are no rules prohibiting manure application onto high water table soils. The Proposer uses and exceeds BMPs for manure application and follows all state rules and local ordinances. (bolding added for emphasis) This declaration (in bold) by the project proposer demonstrates how	The Proposer has agreements with landowners for manure application covering 16,669 acres. Depth to groundwater will vary throughout these acres. There are no rules prohibiting manure application onto high water table soils. The Proposer uses and exceeds BMPs for manure application and follows all state rules and local ordinances. These State rules are incorporated as conditions in the feedlot permit to protect water quality through setbacks from wells and surface waters, restrictions on application during winter conditions or snow-covered ground, phosphorus management, manure incorporation or injection requirements, runoff prevention, manure management planning, erosion control and vegetated buffers, and additional protections for vulnerable geologic settings such as karst. Minn. R. Ch. 7020 and the permit require that manure is not applied in a manner that exceeds the hydraulic loading capacity of the land application site based on soil conditions.

Comment Group	Comment	Response
	feedlot operators can take advantage of the agency's overly lax feedlot rules to apply manure where shallow water tables are vulnerable."	
383	Commenters suggest that smaller farmers are better able to manage manure handling.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
384	Commenters states, "I live 4 miles as the crow flies, we have noticed our well water smelling due to the saturation of soils with manure."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
385	Commenters note that manure spills happen whether through operator error, structural failure, or natural disaster.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
386	Commenters are concerned the Project will threaten groundwater.	The Project Site and the Off-Site Well/APEC Well are within the Pomme de Terre River Watershed. There are no lakes, streams, wetlands, or intermittent streams at the Project site. There are no aquatic invasive species or impaired waters within one mile of the Project site. Surface water from the Project will flow south/east to County Tile 30, which runs across the south side of the Project site. County Tile 30 outlets into two unnamed creeks (WID 070200002-551 and 07020002-552),13 which then flows to the Pomme de Terre River (WID 07020002-501), and then eventually to the Minnesota River (WID 070200001-552). The Off-Site Well/APEC Well is near the Pomme de Terre River valley and is screened in a Quaternary Water Table Aquifer (QWTA). The Project site is designed to capture and reuse most or all of stormwater runoff, largely eliminating the untreated runoff that currently leaves the property. In addition, Best Management Practices (BMPs) will be adhered to with this Project to limit the potential for nitrate impacts on water resources including manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features and other waterbodies. The Project will replace cropland with impervious surface, grass/landscaping, and stormwater basins. The addition of stormwater basins will balance stormwater flow by collecting and filtering the water before release. Additionally, the impervious surface will include feed storage and solid manure

Comment Group	Comment	Response
		storage areas. The Project will direct runoff from the feed storage and solid manure storage areas to an LMSA for land application. Ultimately, the calculated runoff for the Project site will decrease to 106 MGY and the post-treatment runoff sediment and nutrient amounts will decrease to 0.05 tons/acre of sediment annually. Water that is not recaptured would be discharged to the county tile system after passing through a stormwater basin with natural filtration. The water discharge rate would follow agronomic rates and would not be higher than it would be without the dairy.
387	Commenter states, "This amount of animals will also produce a record amount of manure that will be disbursed locally, also endangering the "public" asset of clean water."	The Project Site and the Off-Site Well/APEC Well are within the Pomme de Terre River Watershed. There are no lakes, streams, wetlands, or intermittent streams at the Project site. There are no aquatic invasive species or impaired waters within one mile of the Project site. Surface water from the Project will flow south/east to County Tile 30, which runs across the south side of the Project site. County Tile 30 outlets into two unnamed creeks (WID 070200002-551 and 07020002-552),13 which then flows to the Pomme de Terre River (WID 07020002-501), and then eventually to the Minnesota River (WID 070200001-552). The Off-Site Well/APEC Well is approximately 500 feet west of the Pomme de Terre River. The Project site is designed to capture and reuse most or all of stormwater runoff, largely eliminating the untreated runoff that currently leaves the property. In addition, Best Management Practices (BMPs) will be adhered to with this Project to limit the potential for nitrate impacts on water resources including manure will be applied at agronomic rates, supplying only the nitrogen (N) needed by the crop to be grown. The Proposer will use the MPCA's Nutrient Management tool to calculate the amount of nitrogen that can be safely applied to each of their application fields. This tool considers manure N levels, the type of crop to be grown, and previous manure application (residual N levels) to indicate how many gallons per acre may be applied. The Proposer will also follow the state or county setbacks from ditches, lakes, tile intakes, and wells, to prevent nutrient runoff into those features and other waterbodies. The Project will replace cropland with impervious surface, grass/landscaping, and stormwater basins. The addition of stormwater basins will balance stormwater flow by collecting and filtering the water before release. Additionally, the impervious surface will include feed storage and solid manure storage areas. The Project will direct runoff from the feed storage and solid manure storage areas to an LMSA for land application. Ultimately, the calculated runoff for the Project site will decrease to 106 MGY and the post-treatment runoff sediment and nutrient amounts will decrease to 0.05 tons/acre of sediment annually (EAW attachment 24). Water that is not recaptured would be discharged to the county tile system after passing through a stormwater basin with natural filtration. The water discharge rate would follow agronomic rates and would not be higher than it would be without the dairy.
388	Commenters are concerned that the Project will threaten water quality.	The Project Site and the Off-Site Well/APEC Well are within the Pomme de Terre River Watershed. There are no lakes, streams, wetlands, or intermittent streams at the Project site. There are no aquatic invasive species or impaired waters within one mile of the Project site. Surface water from

Water that is not recaptured would be discharged to the county tile system after passing through a stormwater basin with natural filtration. The water discharge rate would follow agronomic rates and would not be higher than it would be without the dairy.
389	Commenter states, "MPCA fails to extend its authority over pollution caused by manure delivered to other farmers and landowners."	Minn. R. Ch. 7020 and Feedlot Permit requirements include requirements relating to manure application in general and the transfer of manure. Minn. R. Ch. 7020 requires that manure is applied in a manner that does not result in discharge to waters of the state during the application process or cause pollution of waters of the state due to manure contaminated runoff. When manure from the Project is transferred the manure recipient must comply with the Project's nutrient management plan (NMP). While Permittees do not control the ultimate actions of manure recipients, Permittees are required to include in their NMP protective measures a recipient must follow to ensure manure is applied in a proper manner. In this context Permittees do have responsibility for manure they transfer. The MPCA is the regulatory authority for the Project and manure applications relating to the project. The Minnesota Department of Agriculture provides oversight and requires training and licensing for Commercial Animal Waste applicators.

Comment Group	Comment	Response
390	Commenter states, "There certainly is a problem with millions of gallons of manure application in such a small area – application that is limited by truck travel."	Liquid and solid manure will be collected, stored, processed, and land applied as fertilizer on cropland according to the associated NPDES permit and Nutrient Management Plan. Local producers have identified and offered 16,669 acres of currently tilled cropland for manure application. The Proposer expects to utilize approximately 13,200 acres per year. The manure application sites are within: Stevens County (Baker, Darnen, Horton, Synnes, and Scott Townships) and Swift County (Hegbert and Fairfield Townships) as shown in EAW Attachment 5 and Attachment 8. The manure application sites are currently cultivated for crop production, and landowners may have used the fields for manure application in the past. The Proposer executes manure application by a dragline hose system. The Proposer pumps manure from the Project through a series of hoses overland to reach application fields. This system provides flexibility in the number of available routes to reach manure application fields. It also greatly reduces the impact of manure application equipment on local road infrastructure.
391	Commenters make note of the sheer volume of manure that will be produced at the site. The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
392	Commenters express concern that there is an increasing number of extreme weathers events in Minnesota.	Increased precipitation may cause the loss of some acres of cropland due to saturation of low spots within fields or localized flooding after rain events. New drainage or water impoundment systems may need to be developed by landowners to handle increased volumes of stormwater in fields. If these structures are built on any of the manure application fields, they would take land out of crop production to convert to water management structures. With a contingency of over 3,000 additional manure application acres beyond what is needed each year, there is abundant operational flexibility if some portions of the fields are no longer available due to weather condition impacts. The Proposer has designed the Project to have 14 months of manure storage, which provides a buffer in case some application fields are temporarily unavailable.
393	Commenter states, "There certainly is a problem with millions of gallons of manure application in such a small area – application that is limited by weather conditions."	Increased precipitation may cause the loss of some acres of cropland due to saturation of low spots within fields or localized flooding after rain events. New drainage or water impoundment systems may need to be developed by landowners to handle increased volumes of stormwater in fields. If these structures are built on any of the manure application fields, they would take land out of crop production to convert to water management structures. Manure application begins around September 1st, following corn silage harvest and applied 24 hours a day, 6 days per week for approximately 30 days each year. The Proposer anticipates sufficient time is available between

Comment Group	Comment	Response
		September 1st until freeze to apply all manure. In addition, the Proposer has several thousand extra acres of tillable land available to spread manure to help account for unsuitable field conditions. However, if weather conditions during the fall prevent complete emptying of the LMSAs and land application of solid manure, the Proposer will apply manure the following spring. With a contingency of over 3,000 additional manure application acres beyond what is needed each year, there is abundant operational flexibility if some portions of the fields are no longer available due to weather condition impacts. The Proposer has designed the Project to have 14 months of manure storage, which provides a buffer in case some application fields are temporarily unavailable.
394	Commenters expressed concerns about impacts on human respiratory health from the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
395	Commenters expressed concerns about human health impacts as a potential result of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
396	Commenters expressed concerns about water quality leading to human health impacts from the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
397	Commenters express concerns about impacts to the community from the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
398	Commenters describe concerns about impacts to the economy from the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
399	Commenters discussed concerns about the Project's impacts related to environmental justice.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
400	Commenters have concerns about impacts to nearby economy.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
401	Commenters have concerns about the size of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
402	Commenters are concerned about the massive amount of strain the Project would put on the electrical grid.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
403	Commenters note multiple concerns related to social issues and values.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
404	Commenters want to know if there is data on Contaminants of Emerging Concern (CEC) for Shakopee Creek	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
405	Commenter states that they toured Riverview's Waukon Dairy and noted that there was no ongoing monitoring of the aquifer or surrounding water quality.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
406	Commenter states "This is not the kind of industrial farming that benefits anyone other than the corporation that reaps profits at the expense of everyone who seeks a safe water supply."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
407	Commenter states "There are better ways that don't harm water."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
408	Commenter notes that there used to be cows in the Pomme de Terre River.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
409	Commenter states "To comply with MEPA, MPCA cannot simply proclaim that the Expansion Project will have no cumulative effects on water quality—it must take a hard look at the potential for significant environmental effects. Thus far, it has not done so."	MPCA takes a hard look at the potential for significant environmental effects as it develops the Findings of Fact, Conclusions of Law, and Order, which is based on the Environmental Assessment Worksheet as well as all comments received during the public comment period.
410	Commenter states "The EAW's cumulative effects analysis does not recognize the poor water quality already existing in this part of Minnesota and how the Expansion Project will exacerbate the problem."	In the EAW the MPCA identifies the known impairments that could be affected by the Project. After collecting all of the information through the Environmental Assessment Worksheet and comments submitted during the public comment period, and then while developing the Findings of Fact, Conclusions of Law, and Order, the MPCA must consider the following factors: whether the cumulative potential effect is significant; whether the contribution from the project is significant when viewed in connection with other contributions to the cumulative potential effect; the degree to which the project complies with approved mitigation measures specifically designed to address the cumulative potential effect; and the efforts of the proposer to minimize the contributions from the project. The Proposer is required to follow Minn R. 7020 through conditions found in the feedlot permit, including the individual NPDES permit and nutrient management plan. These permit

Comment Group	Comment	Response
		conditions and requirements are intended to protect water quality through governing the storage, transportation, disposal, and utilization of animal manure.
411	Commenter states, "Also, I have noticed that our water quality has gone down in past 15 years."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
412	Commenter states, "The scale of the West River Dairy expansion poses the following significant risks: - Environmental Persistence: Estrogens in dairy wastewater are notably persistent and often fail to biodegrade under the anaerobic conditions found in manure storage lagoons."	According to the University of Wisconsin Extension (Fall 2011) Publication, Assessing the Potential Effects of Hormones in Livestock Manure, hormones were found to be rapidly degraded in stormwater runoff, which suggests minimal impact on aquatic organisms, and efforts that prevent manure from entering waterways will likely prevent hormones from entering surface waters.
413	Commenter states, "Are we playing to emotion or are we going to look at facts, data and research? Data such as water that impacts the environment and those around it."	The EAW has considered direct and cumulative impacts to surface water and groundwater resources at the facility, on areas identified for manure application, and within the Environmentally Relevant Area (ERA) within a one-mile radius of the Project site. These impacts are regulated through the MN DNR's water appropriations permitting program and process and the MPCA's feedlot permit for compliance with Minnesota Rules 7020
414	Commenter states, "I have concerns that the expansion will be part of contributing to this flooding as well as being affected by it."	The Project is outside of the 1% Base Flood Elevation and not located within a delineated flood plain (100-year flood). Critical infrastructure at the Project site (animal holding, manure storage, feed pad) is at a relatively higher elevation, which provides additional protection in case of extreme precipitation events.
415	Commenter states, "Crop and livestock production contribute to 85 percent of the state's water pollution."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
416	Commenter states, "This omission understates the true environmental harm and risks, allowing further degradation of already vulnerable water resources."	The omission in the comment is referring to is "The EAW ignores the cumulative and compounding increases in nitrate and phosphorus pollution, that an Expansion Project would contribute" a previous comment by the commenter that was responded to in comment group 256. The Commissioner of the MPCA will make the determination on the need for an EIS after carefully reviewing all the information in the EAW, written public comments, and the Response to Comments. Upon reviewing all of the available information, the Commissioner determines if the Project has the potential for significant environmental effects following the criteria specified in Minn. R. 4410.1700 subp. 7. The Commissioner issues Findings of Fact, Conclusions of Law, and Order to support either a positive declaration on the need for an EIS, or a negative declaration on the need for an EIS.

Comment Group	Comment	Response
417	Commenter states the Project is in the "Stevens County's Soil and Water Protection District."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
418	Commenter states, "My wife grew up on the farm we now live on, I'm very familiar with the water on this farm. Of the 40+ years of using the water here; it's only been in the past five to six years I've seen the water go from strictly a rusty iron and sand problem to a heavy manganese problem."	Manganese is a naturally occurring element and is commonly observed in Minnesota groundwater even at concentrations that exceed the Minnesota Department of Health (MDH) drinking water standard. Manganese can be mobilized due to a change in redox conditions in the groundwater. The Minnesota Department of Health (MDH) has information and resources for better understanding and addressing this contaminant in drinking water. https://www.health.state.mn.us/communities/environment/water/contaminants/manganese.html
419	Commenter states, "The extra methane would contribute to water pollution."	Methane is not a regulated water quality parameter under the Clean Water Act, the Minnesota Pollution Control Agency's surface water quality standards (Minn. R. Ch. 7050), or any federal or state CAFO regulatory framework. There is no numeric water quality criterion for dissolved methane in Minnesota waters, no drinking water standard for methane under the Safe Drinking Water Act, and no aquatic life criterion. Dissolved methane at concentrations encountered in normal surface waters does not cause toxic effects on aquatic life, does not affect drinking water suitability, and does not produce ecological impacts at any scale that has prompted regulatory standard-setting.
420	Commenter states, "The nitrates in our water due to ag waste runoff was well above advisable levels."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
421	Commenter states, "I believe it is important to protect the environment by preventing water contamination."	The NPDES/SDS feedlot permit (Attachment 22) addresses runoff, manure storage, agronomic-rate land application, and the manure management plan in compliance with state standards designed to protect the watershed. The EAW has considered direct and cumulative impacts to surface water and groundwater resources at the facility, on areas identified for manure application, and within the Environmentally Relevant Area (ERA) within a one-mile radius of the Project site. These impacts are regulated through the MN DNRs water appropriations permitting program and process and the MPCA's feedlot permit for compliance with Minnesota Rules 7020.
422	Commenter states, "The site is in an environmentally sensitive watershed,"	The NPDES/SDS feedlot permit (Attachment 22) addresses runoff, manure storage, agronomic-rate land application, and the manure management plan in compliance with state standards designed to protect the watershed.
423	Commenter states, "Please study the issue to determine if this many animals can live in close quarters without disrupting the water in the surrounding area."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.

Comment Group	Comment	Response
424	Commenter states, "The more drainage tile that is put into farm field leads to more flooding as water moves faster than it historically did in the prairie pothole region of MN."	The Project is on cultivated agricultural cropland with improved drainage featuring a matrix of private pattern tile and County Tile 30. There is currently no retention or treatment of any surface water runoff within the Project area. The proposed Project will include the retention, filtering, treatment and/or reuse of surface water runoff that would otherwise be directed downstream by existing drainage. Therefore, surface hydrology changes expected from this Project would be reduced runoff post-construction.
425	Commenter states, "Thousands of feet of private drain tile connect to a nearby public county drain tile (underground pipe) that drains the acres in and around the dairy operation and flows east directly to the Pomme de Terre River. Drain tiles act as a direct conduit for toxic nutrients such as nitrates."	The Project is on cultivated agricultural cropland with improved drainage featuring a matrix of private pattern tile and County Tile 30. There is currently no retention or treatment of any surface water runoff within the Project area. The proposed Project will include the retention, filtering, treatment and/or reuse of surface water runoff that would otherwise be directed downstream by existing drainage. Therefore, surface hydrology changes expected from this Project would be reduced runoff post-construction.
426	Commenter states, "I also enjoyed the natural areas around Morris, such as the Big Stone National Wildlife Refuge and the Edwards Wetland Management Area, which, along with the city, depend on good water levels."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
427	Commenter states, "Farming is Everybody's Bread, Butter, and Water. What I do on my hills affects water quality and quantity for Everybody."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
428	Commenter states, "Water scarcity is a huge problem world-wide."	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
429	Commenter states, "An EIS is necessary to explore alternative methods for land application of livestock wastes from this facility as part of the remedial actions called for in the TMDLs".	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
430	Comments encouraging MPCA to approve the Project/Feedlot Permit.	The EAW is not an approval or denial document. The EAW is intended to be a screening document for the Potential for Significant Environmental Impacts. Projects where the RGU determines that there is

Comment Group	Comment	Response
		the Potential for Significant Environmental Impacts per Minn. R. 4410.1700 Subp. 7 Items A-D. must order an EIS.
431	Comments express support for the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
432	Comments opposed to the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
433	Comments noting the unprecedent size of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
434	Commenters express concerns about the size of the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
435	Commenters expressed general concerns about the Project.	The comment is out of scope for the EAW as it does not substantially inform the decision on the need for an EIS per the evaluation criteria in Minn. R. 4410.1700 subp. 7.
436	Comments relate to the hydraulic connectivity of the off-site well to the Pomme de Terre River.	"From Comment Letter 1067 submitted by Nathan Kestner, Minnesota Department of Natural Resources. MN DNR's March 17 comment letter [Letter 482] had stated that the EAW did not consider impacts from the potential groundwater appropriation on the Pomme de Terre River. That comment was inaccurate as written - the EAW does describe potential interactions between groundwater appropriation and the Pomme de Terre River in Sections 12.B.3 and 12.B.4, including discussion of pumping restrictions intended to reduce impacts. MN DNR's March 17 comment was intended to clarify that: -Available aquifer test data (NRG, 2007) indicate that pumping from well 740629 is hydraulically connected to the Pomme de Terre River, and that a portion of pumped water is derived from induced infiltration or reduced baseflow to the river. -As a result, groundwater appropriation at this location has the potential to impact river flow, particularly during lower flow conditions, depending on pumping rates and duration. MN DNR is currently completing an updated evaluation of flow conditions in the Pomme de Terre River. This analysis will inform any permit conditions associated with application 2025-1502. Consistent with Minnesota Statutes and prior DNR guidance (MN DNR, 2016), any issued permit would include conditions designed to prevent negative impacts to the river, particularly during low-flow periods."
437	Comment states, "The EAW indicates in section 12.B.3.d that the wells for the existing facility and the off-site well are located in separate aquifers. The shallow	Comment will be forwarded to the Proposer. Although the on-site wells and the off-site well are screened in different aquifers, DNR's analysis shows that the shallow and deep aquifers in this area are hydraulically connected and function as a single groundwater system with limited water availability. Consequently, the proposed wells do not provide a diversified groundwater source.

Comment Group	Comment	Response
	and deep aquifers in this area are part of one connected system, and water availability from these aquifers is limited. The proposed water sources do not constitute a diversified groundwater source approach. Due to the aquifer connections, cumulative existing and proposed water appropriation will be considered during water appropriation permitting."	Because of these hydraulic connections, cumulative existing and proposed water appropriations will be evaluated during the DNR's water appropriation permitting process for this Project.
438	Comment states, "The current West River Dairy operation relies on two groundwater appropriation permits associated with the operation: • Permit 2004-1023: 95 MGY for livestock watering from four wells located near the current dairy operation. This permit includes groundwater-level monitoring conditions. • Permit 2009-0492: 21.3 MGY for livestock watering and 64.4 MGY for agricultural irrigation from one well located in the proposed expansion project area. This permit may need to be amended to reflect changes in land use.""	Comment will be forwarded to the Proposer.

Greg Reuter **Letter 1**

I am grateful to have Riverview as part of our community. I support this project because they are an outstanding company that cares for people, animals, and the environment. The manure produced will replace commercial fertilizer—reducing the need for imported products—while helping grow future crops and improve soil health. In addition, it will give area farmers the opportunity to sell their crops for local use rather than shipping them long distances. This project is a great opportunity for our community and will not have a negative impact on the environment.

Paul Wulf **Letter 2**

My name is Paul Wulf, I am submitting this in favor of West River expansion. I have been a Stevens County resident for 46 years. I have farmed for the last 20 years. Having Riverview as a neighbor has been a good experience for me. I live and farm in the middle of the 3 sites that they have in Stevens Co. They go out of there way to make sure the neighbors are happy. From watering roads for dust control during harvest to adding some extra gravel when they are done harvesting when it is muddy I feel they go above the call of duty. They even pay for Chloride on the gravel road(for dust Control) past my house every summer because of the increased traffic. They have also provided another option for marketing my crop, and the manure program that they have is a big benefit to my farm for productivity but also soil health. I am also a drainage contractor that works with Riverview. I know that water quality is important to them as we have done many projects with them to help stop erosion and have eliminated many open intakes with French Drains to improve water quality running off of their farms. Livestock is an important part of our rural community and we welcome the West River expansion.

Respectfully

Paul Wulf

Travis Moser **Letter 3**

I've lived in Stevens County for more than 30 years and farmed here for 18 years. In that time, I've seen how much Riverview contributes to our community. They partner with local farmers to raise silage, alfalfa and other crops needed to feed their cattle, providing a lot of opportunities locally for our crops. They also provide manure for our crops that we have seen improve our overall cropping system. They follow best practices when applying manure. Their sites are clean and contained.

This expansion would bring new jobs to the area, which means more families and more students for our rural communities and schools. Riverview's presence supports our county in more ways than just economically, and I believe this project will continue to have that positive impact. Riverview has always gone above and beyond in being a great neighbor in our community. For these reasons, I fully support MPCA to approve the expansion permit for West River Dairy.

Thank you,

Travis Moser

Marc Stevens **Letter 4**

My name is Marc Stevens, and I farm in Chippewa County. I grow sugar beets, corn, soybeans, and alfalfa, and I have worked with Riverview for several years.

I receive manure from the dairy as part of my nutrient management plan. Before any application, my fields are soil tested and manure is applied at agronomic rates following state guidelines. From my experience, this is a structured and responsible process.

Manure has improved my soil health, increased organic matter, and reduced my need for commercial fertilizer. The dairy greatly reduces shipping of inputs and commodities we produce. The long term partnership supports improved environmental aspects and the long-term sustainability of the farm.

I understand this expansion is being reviewed through the state's environmental process. Based on my firsthand experience working within those rules, I am confident the project can continue to operate responsibly.

I support approval of the West River Dairy expansion.

Respectfully,

Marc Stevens

Mitch Koehl **Letter 5**

I have lived in Stevens County 46 years. I have farmed here for over 20 years. I currently live less than 1 mile from one of Riverview's existing dairy sites. Riverview has been very respectful of their neighbors. The gravel road I live on is better today than when the dairy was first built due to Riverview adding gravel to repair any damage that may have been caused by harvest operations. They have also provided us opportunities that would have never been available to us without their presence in our county. These opportunities include added value to the sale of our crops, manure which has added value to our land, and job opportunities for us and our kids assisting with harvest operations. I support the West River Expansion project as it will add value to additional acres in this region and provide opportunity to future generations.

Thank You,

Mitch Koehl

Daniel Zimmerli **Letter 6**

The environmental and social implications Riverview's plan to construct a feedlot of this magnitude alone are appalling. Riverview and CAFO feedlots like it externalize costs, pollute our environment, destroy family farms and deliver no benefit to consumers.

Feedlots like Riverview's externalize costs by putting such significant strain on the environment and the pollution they cause from such a huge concentration of animal manure on a small geographic location. Even with the best of plans the manure inevitably ends up in the water either through structure failure, natural disaster or both. Nitrate pollution in the water is a leading contender for increased cancer rates in the population.

Further, feedlots like Riverview destroy family farms. Through their sheer size they outbid small family farmers for inputs and resources. They claim they'll deliver lower prices for consumers and that may be true in the short term but over a long enough time, and after they've put small farmers out of business, they will increase their prices.

At a minimum an Environmental Impact Statement should be completed and made public. However, this project SHOULD NOT be permitted because of the extreme threat of pollution, the costs the pollution

will incur to the communities around it and down stream of it, and the dire threat CAFOs like this pose to small family farmers.

Robert Schultz **Letter 7**

A development of this magnitude with the capability to pollute our already fragile water system in this state must at least require an Environmental Impact Statement (EIS).

Pete McDonnell **Letter 8**

I support what Land Stewardship Project says about this unprecedented CAFO operation: Minnesota's largest dairy producer has applied to build the first livestock operation in the state to hold over 20,000 animal units. If built, the concentrated animal feeding operation (CAFO) will hold 18,855 dairy cattle, bringing the total animal units to 26,397 in one facility.

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest livestock operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

The Minnesota Pollution Control Agency (MPCA), which is the agency that issues Minnesota's feedlot permits, must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview, LLP must be required to undergo a full Environmental Impact Statement (EIS).

Please make sure due diligence is done for the people of MN, and conduct a thorough EIS on this huge dairy operation!

Sincerely,

Pete McDonnell

Melissa Driscoll **Letter 9**

Hello MPCA Staff and Commissioners,

I farmed for 15 years near Kenyon, MN. In my experience even a small confinement dairy can pollute the air within 2 miles of the facility, and the water many miles downstream. It is extremely important as we look at the future of our beautiful state to protect the water and air quality that we have, and improve both. Confinement dairy's are not good for rivers, streams, human health or animal health, or our agricultural economy. In order to learn more about exactly how our natural resources will be affected we must have an EIS completed as described in MN Rules 4410.2300. Sincerely,

Melissa Driscoll

Aaron Christopher **Letter 10**

This proposed operation is an unprecedented escalation in scale for Minnesota—nearly double the size of the state's next largest facility in animal units. This isn't just another farm; it is a fundamentally new and dire threat to the survival of Minnesota's independent farmers and rural communities.

The sheer volume of waste—over 200 million gallons of wastewater and 26,000 tons of solid manure annually—makes a comprehensive environmental impact assessment non-negotiable. We are looking at a massive ecological footprint in the Pomme de Terre watershed, an area already classified as sensitive. With the Pomme de Terre River and a nearby creek already officially listed as impaired by the MPCA,

allowing an expansion of this magnitude is a reckless gamble that will inevitably worsen an already critical situation.

Diane Wood **Letter 11**

This is insanity in action.

Robert Christie **Letter 12**

A proposal requesting removal of 300 million gallons of water from any aquifer that is already a water source for many families should voluntarily agree to do an EIS. AS alarming as water use is, even worse is a request to apply over 200 million gallons of manure on coarse textured ground. Here in SE MN. an area of high livestock numbers we have an alarming number of wells that have developed high nitrate levels. Now is the time to get it right and ask the right questions. Please make every effort to protect our greatest resource WATER. Require an EIS!

Katie Subra **Letter 13**

I oppose the building of yet another CAFO in Minnesota - namely Riverview, LLPs proposed facility for 18,855 dairy cattle in one facility. Not only does an operation of this scale decimate the ability for small farmers to continue to be viable, but it also threatens the ability to ensure environmental securities and labor securities for years to come. Please prevent this license.

Anna Loney **Letter 14**

When "get big or get out" becomes "grow to gargantuan proportions and take up all the resources" it reminds me of Grandma's saying - "I like a pig, but damn a hog."

Stop hogging!

Sincerely,

Anna Loney

Nancy Ellison **Letter 15**

I am concerned about the impact of such a huge concentration of cattle on the people living in the area and hope you will require an environmental impact statement and study it carefully.

Alison Leathers **Letter 16**

I am writing to ask for a full EIS to be done on Riverview, LLP(for the proposed 11,000-cow dairy feedlot in Section 1 of Synnes Township in Stevens County). An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. This proposal is the largest the state has ever seen so a full EIS should be required and conducted. Thank you for considering my request.

Diane Johnson **Letter 17**

Riverview, based out of Morris, Minn., is one of the largest dairy producers in the country. With barns and facilities spread across western Minnesota, Riverview, LLP already milks over 125,000 dairy cows in Minnesota alone. They also have a presence in North Dakota, South Dakota, and Arizona. Now, they

have begun the permitting process to build the largest CAFO in Minnesota, which could create a model of industrial dairying that our state has never seen.

An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit.

According to the documents filed by Riverview, the proposed operation would require:

- To supply water for the operation, pumping from an off-site well will be limited to 226 million gallons per year. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year.

- Liquid manure storage encompassing 250 million gallons of waste.

- 13,200 acres of farmland for manure application.

Riverview has a recent history of manure spills in western Minnesota. In Arizona, the company recently agreed to deliver $11 million to residents affected by the dairy's overpumping. The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review

Just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

PLEASE do an EIS!!! This kind of project will do irreversible harm to our agricultural community for generations to come.

Joshua Howe **Letter 18**

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted

to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Janet Lenius **Letter 19**

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Thank you for your time and consideration.

Sincerely,

Janet Lenius

Paul Moss **Letter 20**

Please consider the following comments:

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Thank you for your consideration.

Jack Judkins **Letter 21**

Large CAFOs do not have a good environmental record and are not more efficient than smaller operations. Should at the very least require an EIS. Groundnwater as well as run off pollution are real possibilities.

Mark Klinski **Letter 22**

Being from SE MN , where smaller dairy farms ,less than 200 cows, are usual, we need some common sense in regulations to control Massive CAFOs, flooding the milk market & running other farmers out of Business, Truckers also, & regional Processors all declining, In my opinion there is No Way the Manure can be managed from this size of operation, without detrimental effects to Roads, Neighborhoods & Land ,& Environment

We need to exercise Caution On these concerns, WE do not Need this, Just because a Conglomerate wants to Take Over more Markets, Thank You, Mark

Kathleen Wold **Letter 23**

Please require an environmental impact assessment of this massive project.

Elizabeth Brandt **Letter 24**

Just say no! This is wrong on so many levels. Small dairy farms need to be part of the MN fabric. Allowing this turns people into employees. We need INDEPENTED FARMERS in MN.

Nancy Zaworski **Letter 25**

Please do not allow such a monstrous operation. It will be destructive to our rural communities.

Thank you

Robert Walser **Letter 26**

As a small-scale farmer (about 30 tillable acres) I am extremely concerned about the environmental risks of CAFOs. The concentration of wastes exceeds capacity for use as soil amendments resulting, historically, in lagoons, spills and environmental degradation. Further, the bio hazard of so many animals in confined spaces increases the risk of disease and, in particular, the negative impact of antibiotic resistance due to the so-called prophylactic use of antibiotics in CAFOs. This project demands deep questioning and scrutiny.

Nick Olson **Letter 27**

It has come to my attention that Riverview Dairy is looking to expand their operation to a level that we have not seen before in Minnesota. As a small scale farmer in central Minnesota who is connected to a lot of other farmers in the region, we are all struggling to get by financially. Dairy farms continue to close up shop in all of our counties and the answer is not to have one large dairy farm operating in our region. This is a recipe for disaster on so many levels from our local farm economies to the environmental impact on such a large operation. I have a friend who used to run a dairy farm near Riverview and they could not get the milk truck to pick up at their farm because they were too small. This is not the farm economy we want in rural Minnesota. Driving farmers out of business due to scale and capital is the exact opposite of what is going to keep our rural communities thriving. Let's think of creative solutions to protect our water and land while keeping farmers on the land in our communities.

Audrey Arner **Letter 28**

Wow, that's just too many cows in one spot! Because of my concern for the potential for contamination of the gifts of creation, especially including the waters around the proposed Riverview site, an EIS should be absolutely required for this enormous expansion. Please do right by the precious remaining wetlands that are within proximity to this site as well as the civic infrastructure like roads. Come on now.

Faye Duvall **Letter 29**

This large scale is against wise and environment best practices use of our land and water.

Evan Skaurud **Letter 30**

My name is Evan Skaurud, I grow corn, sugar beets, soybeans, dry beans and alfalfa, and I have worked with RiverView Dairy for several years.

I receive manure from the dairy as part of my nutrient management plan. Before any application, my fields are soil tested and manure is applied at agronomic rates following state guidelines. From my experience, this is a structured and responsible process.

Manure has improved my soil health, increased organic matter, and reduced my need for commercial fertilizer. The dairy also provides a reliable local market for crops like silage and alfalfa.

I understand this expansion is being reviewed through the state's environmental process. Based on my firsthand experience working within those rules, I am confident the project can continue to operate responsibly.

I support approval of the West River Dairy expansion.

Respectfully,

Evan Skaurud

James Tjepkma **Letter 31**

I formerly lived among farmers in Southern Minnesota and have done various kinds of educational and service work with farmers both for pay and as a volunteer. Much of what I did focused on sustainable agriculture. I have also participated in actions lead by an environmental group that included apposing a project that required an Environmental Impact Statement. Based on my understanding of EISs and of sustainable agriculture and agriculture in general I am strong in support requiring an EIS for the West River Dairy Expansion Project.

If this project goes forward there is no doubt it would have great potential for many kinds of environmental damage and damage to communities near by as well as wider damage to the state's dairy industries. I don't see how this would not be true for an operation that would be very much larger than any current existing operation. I don't think I need to list all of the ways such a large operation would have the potential for being very damaging in many ways. An EIS is very definitely needed to looked at these potential damages, present this information to the public, and hold hearing where the public can be informed and can make comments.

Michael Kennedy **Letter 32**

This operation would use excessive amounts of ground water (a public asset) for any single business. We need to conserve not flagrantly over use this resource. This amount of animals will also produce a record amount of manure that will be disbursed locally, also endangering the "public" asset of clean water. This expansion is a foolish proposal and should be denied in the public interests of health and environmental damage.

David Anderson **Letter 33**

Please deny Riverview's application for expansion of their dairy farm. We already have enough nitrates in the ground water and runoff into streams and rivers are also a problem.

Pam Hartwell **Letter 34**

One of the many reasons dairy farmers are struggling throughout the state is that they have to compete with the benefits given, efficiencies and corner cutting of large scale operations. Large scale operations may make sense on purely economic level, but the concentration of animals does not make sense by any other measurement of success. Small farmers across the state are better able to manage herd health, manure handling, and pasture. Large operations with large amounts of animals and their manure NEED to have plans in place APPROVED by environmental scientists that are MANDATED to protect water and land! And neighbors have a right to now what the impact of these extraction facilities, because they are no longer farms at this level! The thought that adding 11,000 cows in one place does not trigger an Environmental review is insane to me.

Myron Sylling **Letter 35**

I am concerned to see this has not been addressed in government yet. A project of this size and scope should have a mandatory EIS performed. EAW's should be for smaller projects. This project affects so many acres that an EIS is a must to thoroughly look into ALL potential risks to the people and environment. The volume of products brought into and shipped out of this facility will create many potential issues. The amount of manure created in this concentrated area should be a major concern for potential water quality issues. Currently the MPCA rules and the BMP's for synthetic fertilizer do not align. Neither do the BMP's for fertilizer/manure application. Water quality for the whole state is currently being reviewed and new guidelines potentially coming forward. It would be wise to wait or at least look at the proposed new guidelines BEFORE granting a permit of this magnitude. Safety of people and the environment should be a top consideration and the best way to ensure that is to perform an EIS.

Mike Menzel **Letter 36**

As a Minnesotan I value our unique natural resources such as clean abundant water. Allowing a super mega dairy and cattle farm near Morris, MN would endanger our water resources, risk contamination of our wetlands and rivers, and force smaller to mid size farms to close due to competition from this behemoth Riverside project. Therefore I urge a rigorous EIS on the environmental and economic impacts to this community.

Mike Menzel, MD

Daniel Belgum **Letter 37**

Minnesota Pollution Control Agency

To Whom it may Concern:

I am deeply concerned about a proposal by Riverview LLP (Dairy) to expand it's operation here in my county: Stevens. This is a huge increase in animal units and will be producing a massive amount of methane, CO2, climate warming gases; massive amounts of waste; and massive amounts of water usage. It also will significantly impact roads, and ground water supplies. I believe, and understand, that this would be the largest dairy facility in the state, and that this size of facility is unprecedented in the state of Minnesota.

This size of dairy will negatively impact small and mid-sized dairy producers, downtown (Main Street) businesses, and poses a significant risk to the multiple watersheds it is near -- including the Pomme de Terre River nearby which is just 20-25 miles from the Minnesota River.

I strongly urge that MPCA do a detailed and deep EIS on this request to add on to this dairy. The public deserves to know more.

Thank you.

Sincerely,

Daniel Belgum

Mary Polta **Letter 38**

Please Let farming be human scale and animals treated humanely. Stop this.

Robin Moore **Letter 39**

This project MUST undergo an environmental review, first and foremost. I can not overstate the impact that CAFO's have on rural residents. Aesthetics and quality of life aside (who really cares about that anyway, right? House values, ability to hang laundry out, ability to take walks outside, all trivial), the impact that a facility like this has on ground and surface water is terrifying. In rural areas, we all know that the acres that they report available for manure distribution are a perfect-case scenario, and the larger the operation, with so much volume and the time it takes to get that volume of manure distributed, the more likely that the ground will be : 1. too wet to get onto which leads to concentration in dry (higher, sandier) acres and any concentration affects surface water 2. Frozen, which leads to run off and contamination of surface water. We have all seen this happen. 3. That not all of the acres will actually be available, that some of the acres will be too far, that concentration will happen.

That's just obvious contamination of surface water. Who pays for that? I haven't seen a tax or any real penalties or any responsibility on Riverview's part to pay for cleaning water.

What about ground water and aquifers - apparently this permit asks for 226 million gallons per year. That's over 2/3rds of what Morris MN is permitted - and how many people does that serve? How many people does Riverview serve? How is this massive CAFO going to affect anyone sharing that aquifer - with concentration of manure, which will undoubtedly happen, especially with larger and larger operations, there will be groundwater contamination. Is Riverview going to pay for RO systems for every rural household on the aquifer? What about volume? How many houses/businesses/towns are going to find their wells dry? Do you know? Probably not, the DNR barely knows this. Will Riverview pay for a thorough study?

This just isn't fair, there is nothing ok about Riverview, but there's even less ok about forgoing an the requirement for an environmental impact statement. No feedlot of whom this has been required has ever continued, because there is nothing environmentally sound about massive feedlots. Those operations were all a lot smaller than Riverview's proposal, how can it be permissible to forgo an Environmental Impact Statement? This sets frightening precedents for corporations (no, Riverview is not a family operation, it is a massive, for profit business that seeks to extract resources with no consideration for the environment or people who live near their operations) to turn our rural areas into "sacrifice zones", sacrificing water, resident flora and fauna, habitat, and live-ability in a huge radius around these areas.

How about economic impact - on dairies, on house values, on rural infrastructure - are you making Riverview fund a 3rd party economic impact assessment? How many small farms is this going to asphyxiate? How many independent farmers is this going to be the final straw for?

I feel like my rural community is becoming an industrial zone, and that's not how agriculture will survive, it's what it looks like before it dies, choking on it's own excess. There should be extra barriers, extra costs, extra diligence, extra taxes, extra requirements for any one business that seeks to impact an entire watershed. Not one single regulation less.

John Gabbert **Letter 40**

As a citizen of Winona County, where we have long fought a large dairy expansion situated on sensitive karst geology, I can really sympathize with the people near Morris where this Riverview expansion will dwarf all other confined animal feeding operations (CAFOs) in the state. It is imperative that the MPCA and its regulators require a full Environmental Impact Statement (EIS for a project of this enormous scope. The MPCA must hold this organization to the letter of the law, and work to protect the people and the environment in the region. Thank you very much.

Michael W Yost **Letter 41**

I am writing to support the approval of the permit allowing Riverview LLP to expand their West River Dairy in Section 1 of Synnes Township in Stevens County. I am a farmer and landowner near several existing Riverview sites and have twenty six years of experience with Riverview and their dairy sites in west central Minnesota. I support the permit for the West River Dairy for several reasons.

1. We live less than two miles from one of Riverview's existing sites and have experienced few if any nuisance issues. No flies, minimal odor, and only slight increase in traffic.

2. Their existing sites are impeccably neat, and runoff is contained.

3. Manure application is done by injection, soil tests are used to determine the quantity applied and manure is a renewable product that replaces thousands of tons of commercial fertilizer.

4. The West River Dairy will require hundreds of acres of alfalfa. An alternative crop for the area's corn and soybean farmers. It is a perennial crop that prevents soil erosion, promotes soil health, sequesters carbon, and provides excellent bee habitat.

5. I have toured multiple dairies from the southwestern United Sates to New England. None are as well operated as a Riverview dairy.

6. The West River Dairy would have a positive effect on our communities, environmentally, economically, and socially.

I strongly support the proposed West River Dairy permit.

Sincerely,

Michael W. Yost

Laura Matanah, Compassionate Action for Animals **Letter 42**

Minnesota's largest dairy producer, Riverview, LLP, has applied to build the first livestock facility in Minnesota to hold over 20,000 animal units. If built, the facility will hold 18,855 dairy cattle, bringing the total animal units to 26,397 in one facility. This proposed expansion would be nearly DOUBLE the size of the next largest livestock operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities. It will also be far worse for the cows who have to live there. This proposal by Riverview must be required to undergo a full Environmental Impact Statement (EIS).

Kay Drache **Letter 43**

This proposed expansion would be nearly double the size of the next largest livestock operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

You must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview must be required to undergo a full Environmental Impact Statement (EIS).

Amy Grace **Letter 44**

This Industrial-Scale Projects Need Industrial-Scale Review.

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Rob Super **Letter 45**

I am very concerned about near-term and long-term impacts of this project. Specifically, I share all the concerns being expressed by the Land Stewardship Project. I now live in Saint Paul but I grew up in a small community in northwestern Minnesota and I understand the negative impacts projects of this size impose on local environments.

I am especially concerned about the precedent that would be set by not requiring an environmental impact statement for this project. I see the EIS as a necessity for this project and others like it.

Benedict Wagner **Letter 46**

An operation this size definitely needs and EIS. It will use almost as much water as the city of Morris. Especially concerning are the nearby water sheds.

Mary Zink **Letter 47**

We are very alarmed by the idea that Minnesota would harbor a massive dairy CAFO. The ecological impacts are many and serious; but the socio-economic impacts are also great. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations will glut the market and allow them to push small and medium-sized

family farms out of business and off the land. Minnesota is already losing family farms and allowing this CAFO operation will only accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

Please support the environment, family farms and Main Streets throughout our state and say NO! to CAFO operations

Thank you for your consideration

Mary Zink **Letter 48**

We are very alarmed by the idea that Minnesota would harbor a massive dairy CAFO. The ecological impacts are many and serious; but the socio-economic impacts are also great. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations will glut the market and allow them to push small and medium-sized family farms out of business and off the land. Minnesota is already losing family farms and allowing this CAFO operation will only accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

Please support the environment, family farms and Main Streets throughout our state and say NO! to CAFO operations

Thank you for your consideration

John LaFave **Letter 49**

Please review this permit with extreme caution, it seems these big dairies only wreck our environment. There has never been any good that comes from having that many animals in one small location. If there was a sewage spill it would create havoc on the local people. Thanks for considering my thoughts.

John

Rebekah Schulz **Letter 50**

Dear MPCA,

I am writing with concern about the Riverview Expansion Act. I request that the proposal by Riverview must be required to undergo a full Environmental Impact Statement (EIS).

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Thank you for your consideration and attending to this matter.

Peace,

Kim Hiltner **Letter 51**

I am writing to express my concerns with Riverview, LLP's proposal to build the first livestock operation in Minnesota to hold over 20,000 animal units. The MPCA must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal must be required to undergo a full Environmental Impact Statement (EIS) on its impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. Minnesota is is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Agricultural consolidation is pushing small and medium-sized family farms out of business and off the land. We must require an EIS before this proceeds.

Connie Schad **Letter 52**

To whom it may concern:

As a concerned citizen of Minnesota, I urge the MPCA to respect our ground water, our air quality and the smaller farmers who are trying to feed us.

Please perform an EIS!

Thank you!

Connie Schad

Dayna Burtness **Letter 53**

According to Minn. R. 4410.1700, subp. 1, the MPCA must order an EIS for projects that have the potential for significant environmental effects.

In deciding whether a project has the potential for significant environmental effects, the MPCA must compare the impacts that may be reasonably expected to occur from the Project with the criteria set forth in Minn. R. 4410.1700, subp. 7.

These criteria are:

A. Type, extent, and reversibility of environmental effects.

B. Cumulative potential effects. The RGU shall consider the following factors: whether the cumulative potential effect is significant; whether the contribution from the Project is significant when viewed in connection with other contributions to the cumulative potential effect; the degree to which the Project complies with approved mitigation measures specifically designed to address the cumulative potential effect; and the efforts of the proposer to minimize the contributions from the project.

C. The extent to which the environmental effects are subject to mitigation by ongoing public regulatory authority. The RGU may rely only on mitigation measures that are specific and that can be reasonably expected to effectively mitigate the identified environmental impacts of the project.

Due to the unprecedented size of this expansion and the potential for significant environmental effects, an EIS is warranted and required by law.

Taylor Gramm **Letter 54**

Dear MPCA,

I have lived in Hancock, MN area for 40 years, and worked in the Ag world for 25 years. The Riverview system has been a huge benefit to our community by bringing in talented individuals, innovation to area farming and area businesses, and overall is very positive to our communities.

It is impressive to see their awareness in environmental situations, and we have witnessed their careful approach to many processes including manure application, diligence in road protection during harvest, and they are quick to respond when the need arises. I appreciate their efforts in neighbor relations also.

Riverview is a true leader in the ag world on safety, cleanliness, and best practices. I believe the West River expansion would be of great value to our area by adding value to farm ground and many more opportunities for area people to stay local.

Thanks, Taylor Gramm

Laura Inman **Letter 55**

I am very concerned about the harmful effects of industrial dairying by Riverview, LLP. A concentrated animal feeding operation of over 20,000 animal units is a major strain on the environment and water resources. With Riverview's history of manure spills and overpumping, the location being in a vulnerable area, and effects on local dairy producers, I'm asking the MPCA to require a full EIS.

Thank you

Mason Koehl **Letter 56**

I am in support for this dairy expansion because of the past history of how well they have taken care of the manure application, how they are great to work with as a neighbor. They care of the community and the well being of the environment. Great company to work with and always kind.

Ellen Rozek **Letter 57**

The Minnesota Pollution Control Agency (MPCA) must require the proposal by Riverview, LLC to undergo a full Environmental Impact Statement in order to analyze the potential negative impacts on water quality and quantity, local roads, and existing independent family dairy farms. Riverview's recent history of manure spills in Western Minnesota (including a manure leak from a biogas digester system in March of last year), as well as the recent settlement the company had to pay out to Arizona residents who had been affected by the dairy over pumping water, both raise concerns that Riverview's planned CAFO will

adhere to the state and local regulations that protect people and water systems. And given that the proposed site for this new CAFO sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River, any pollution is likely to have far reaching consequences.

I spent thirteen years living in Iowa prior to moving to Minnesota. Most of Iowa's animal agriculture operations are CAFOs, and regulation is minimal. As a result, most of Iowa's rivers and streams are aggressively polluted, many as a result of uncontained manure run-off. I do not want to see the same thing happen here.

Furthermore, Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

Before signing off on Riverview, LLC's proposal, the MPCA must require a full Environmental Impact Statement to be conducted. This way, the potential scope of hazards or problems can be evaluated and documented before any final decisions are made.

Clark Koehl **Letter 58**

Riverview has had a positive impact in our community in many ways. They offer countless job opportunities, purchase our crops, provide manure for our fields, and bring a positive, safe feel to the community. They go out of their way to build strong relationships within the community, and have always been very respectful. They have a very strict manure application process to ensure that the manure is always contained and does not affect the environment. They are always quick to respond to cleaning up the roads during harvest, and leave the roads better than they found them. This expansion will bring future opportunity that will benefit the generations to come. I am confident that Riverview will continue to be a positive impact to our community and will continue to operate responsibly with this expansion. As a young farmer I fully support the expansion of the West River Dairy.

Thank You,

Clark Koehl

Sadie Pendaz Foster **Letter 59**

As a Minnesotan and a social scientist who studies the social impacts of climate change and inequality, the recent history of CAFO expansion doesn't bode well for economic and social development, much less for the environment and our waterways. Systemic review of environmental impacts is an absolute must and should be a minimum threshold undertaking. We've seen the nitrates build-up and impact on our pristine water supply from farm runoff in our state already, and studies from Iowa and Minnesota confirm that an inverse relationship exists between economic vitality and confined animal feeding operations within localized communities. Thank you, Dr Sadie Pendaz-Foster

Evelyn Benson **Letter 60**

Riverview Dairy poses a great natural threat to the environment around it. They could completely uproot the entire ecosystem and cause small, honorable, family-owned farms around them to go bankrupt. They ethically should be reviewed for their proposed actions.

Heather Benson **Letter 61**

When I look through the mandatory EIS categories found in Minnesota Administrative Rules 4410-4400, I find it almost laughable that I even need to write this comment to ask the MPCA to require this EIS. How could it possibly be that a facility housing 26,000+ animal units producing over 250,000 gallons of waste PER DAY, drawing over half a MILLION gallons of water from my local aquifer and covering a physical plant footprint of over 1 MILLION square feet not be required to submit a mandatory EIS?

When I look through that list of mandatory EIS triggers, I see many things that would worry me far less than an industrial dairy facility:

Subp. 11. Industrial, commercial, and institutional facilities.

A. For construction of a new or expansion of an existing warehousing or light industrial facility equal to or in excess of the following thresholds, expressed as gross floor space,

(1) unincorporated area, 375,000 square feet;

(2) third or fourth class city, 750,000 square feet;

(3) second class city, 1,000,000 square feet;

Subp. 14. Residential development. A. 100 or more unattached or 150 or more attached units in an unsewered unincorporated area or 400 unattached units or 600 attached units in a sewered unincorporated area;

Subp. 15. Airport runway projects. For construction of a paved and lighted airport runway of 5,000 feet of length or greater

Subp. 22. Sports or entertainment facilities. For construction of a new outdoor sports or entertainment facility designed for or expected to accommodate a peak attendance of 20,000 or more persons or a new indoor sports or entertainment facility designed for or expected to accommodate a peak attendance of 30,000 or more persons, or the expansion of an existing facility by these amounts.

How could it possibly be that a sports stadium hosting 20,000 people (only 4,000 AUM FYI) only periodically need more environmental review than an industrial dairy holding 26,000 AUM 24/365? How can that be?

I am pro-farmer. I want Minnesota farmers to have the best chance to succeed in every way. But we need to recognize there is an important and fundamental difference between a local family farm that runs 223 cows (the average Minnesota dairy herd size) and 18,000. If a business wants to operate at an industrial scale, as Riverview does, then they need to be prepared to undergo industrial review. It is that simple. If you want to play with the big boys, then you need to play by big boy rules. This doesn't even mean anyone is trying to "stop" their business—it is simply Minnesota holding an industrial facility to the same laws and standards that other industrial businesses (and sports stadiums, ahem) must abide by.

Marissa Munsterman **Letter 62**

I support the proposed expansion of this dairy. It's often the small things a business does that show how much they care about their community. Offering free cones on National Ice Cream Day is a simple gesture, but it shows the kind of relationship they want to have with the people around them.

Through my work with the lead farm partnered with Waukon Dairy and Riverview LLP, I have seen firsthand how well the operation is run. The employees treat each other with kindness and respect, and

it's clear that everyone takes pride in their work. I have also never seen such a large facility maintained so well.

Expanding the dairy would only strengthen its positive impact by supporting the local economy and continuing to create opportunities for area farmers and landowners to grow crops for the dairy. From what I've seen, this is an operation that values its employees, neighbors, and community.

Adam Koehl **Letter 63**

I am a farmer that lives in close proximity to Riverview Dairy sites. They have been excellent stewards of the environment and take the utmost care to ensure that this continues. Manure is injected directly into the ground so that crops can quickly utilize the nutrients and no manure runs off. The manure replaces the need for commercial synthetic fertilizers. An expansion would mean more alfalfa is grown in the area which is an excellent rotational crop that improves soil health and surface water quality. This expansion is 3 miles from where I live and I am writing in strong support of this project. It will improve our environment and our community.

Thank you,

Adam Koehl

Megan Horsager **Letter 64**

I have worked closely with Riverview in Chippewa County for several years both by growing forage crops and helping on a harvest crew during silage harvest. Riverview has quickly become one of the most trusted names in our community and have continually showed that they are committed to being good stewards of our resources. Soils are tested before manure application, local wells are monitored for water quality, and their people are contually working with both the local community and state officials to follow the rules and be good neighbors.

The economic possibilities it has brought to our farm have allowed another generation of farmers to flourish, all while going above and beyond the highest levels of environmental stewardship. I fully support their business as a whole including the expansion at West River and I am confident they will comply with all regulations required.

Lucas Koehl **Letter 65**

I am writing in support of the MPCA approving Riverview's Permit application to expand West River Dairy in Synnes Township. I have lived in Stevens County for 42 years, and currently live close by 2 of Riverview's dairy sites. Riverview's sites are among the cleanest, if not the cleanest and well maintained in the industry. Riverview operates their business in a manner that is conscious of those around them, realizing the value of being a good neighbor in the community. Riverview hauls harvested feed past my house and pays for chloride to be applied to the road. If this isn't sufficient, they are quick to water the road as well, respecting local residences, and creating a safer roadway with less dust.

Speaking as a former employee, Riverview has created many employment opportunities locally. My family operates a business supporting the dairies operations of harvesting feed and field applying manure. Manure application operations are done complying with MPCA's strict standards. Manure produced from Riverview's dairies is a very valuable resource for local farmers, being able to cycle naturally produced nutrients back where they came from in order to grow the next years crop.

The dairy expansion will create demand for more feed, including many more acres of alfalfa. Alfalfa adds diversity to crop rotations, reducing crop disease and insect pressure, promoting soil health and increasing profitability for other crops.

This expansion project will provide gainful employment and business opportunities currently and in the future for the families that live in our community.

For these reasons, I strongly support the West River Dairy Expansion.

Respectfully,

Lucas Koehl

John Peck **Letter 66**

I wish to strongly oppose this expansion plan for Ridgeview Dairy. We do not need to encourage more expansion of factory farms in our state - we need more small dairy farms, not larger corporate operations. There are only 2 dairy farms left in my township - there were over a dozen 30 years ago. This loss of small dairy farms is destroying our local economies and is also jeopardizing our state's environmental quality. I've personally seen the adverse impact of manure spills in our watersheds with thousands of dead fish in our nearby river. I do not trust the capacity (or interest) of a Ridgeview Dairy when it comes to protecting our state's environment or even caring about supporting our state's economy. I will also be submitting a seperate comment to MN Attorney General, Keith Ellison, about this situation since Dairyview's expansion is also likely violating federal anti-trust regulations. Dairyview is the LARGEST dairy farm operation in the U.S. – with multiple factory farms in many states milking 100,000 cows - so it is hard to imagine how this huge milk cartel will not lead to price gouging for Midwest consumers.

Mark Gutierrez **Letter 67**

Industrial operations of this size should be required to get a permit and education on mitigating pollution via soil health practices, such as utilizing cover crops to prevent runoff and leaching of nitrates into our water supplies. In addition, these permits should come with a requirement to implement no-till and cover crops across all acres within 3 years. These practices achieve green house gas reductions, draw down CO2, and reduce nitrates and phosphorus from entering our water supply. They maybe a family farm but they are industrial at that size and should be regulated at an industrial level.

Emily Kelly **Letter 68**

Commenting on the West River Dairy expansion; land use and impacts. Having massively unprecedented amount of bovines in one area will definitely impact the site land and surrounding areas in exponential ways. Ground water usage must be considered as well as where and how the millions of gallons of water will be going. This giant proposal is like a small city and is the local water sources as well as waste water processing equip to handle that much?? Rainwater run-off from roofs is another source of displaced water. With numerous huge buildings to house animals on that scale there will be ecosystem impacts from rainwater run-off. Proper manure handling and disposal is paramount especially when the state has never had a feedlot/facility of this size. Given the questionable track record of West River Dairy in other states, the environmental & social impacts of the air pollution, water contamination, and increased soil application must be considered.

Uli Koester **Letter 69**

I am deeply concerned about Riverview LLP's plans to build a large new dairy operation in western Minnesota. This operation could hold up to 20,000 animal units. A dairy this size demands a full EIS by your agency. Please consider the pollution concerns of such a large operation, and how they will effect Minnesotans. Of special concern are the use of ground water, poor air quality stemming from the manure lagoons, and the dangers of these lagoons in a watershed of the Minnesota River.

Grant Visser **Letter 70**

I beleive this expansion would be a benefit in many ways. I have personal experience with a different Riverview site and they have been nothing but good for the community. They support local farmers and even neighbors that don't farm. In my opinion an expansion would only benefit more people, they will buy more feed from more farmers, produce more manure for fertilizer, bring more employees in who can support local businesses. From my personal experience they are very careful and strategic about smell and appearance of all Riverview properties. I know if they expanded an existing dairy the same guideline would be set and they would keep the new part just as neat and odorless as the existing one. They have there manure management and all water management very precise and very well thought out. I know they can easily handle expanding an existing site and all waste management would be just as organized. If this expansion was proposed in our area I would be 100% pushing for it so I don't see how it could be a bad thing in your area.

Kaleb Koehl **Letter 71**

My name is Kaleb Koehl, and I have lived in Stevens County for more than 26 years. During that time, I have seen firsthand the positive impact that Riverview LLP has had on our local community.

Riverview works closely with local farmers to produce the silage and other crops needed to feed their herds, helping keep agricultural production and economic activity within our region. They operate well-managed and clean facilities and have consistently demonstrated that they take their operational and environmental responsibilities seriously.

This proposed expansion would also provide meaningful benefits to our rural communities by supporting local jobs and helping attract and retain families in our small towns and schools.

In addition to Riverview's commitment to the local community, their proposed plan reflects a strong focus on environmental stewardship. Their approach to water quantity management, land stewardship, and manure handling practices demonstrates a clear commitment to responsible resource management. Through these practices, Riverview is prioritizing long-term land stewardship to ensure cropland remains productive for future generations.

For these reasons, I respectfully support the expansion permit for West River Dairy and ask the Minnesota Pollution Control Agency to approve the expansion permit.

Thank you

Kaleb Koehl

Byron Wulf **Letter 72**

My name is Byron Wulf, and I live and farm in Stevens County. I have been working with Riverview Dairy for over 20 years, selling corn and silage to them and buying manure in return. It has been a major benefit to my farm, as my products are used locally and my fertility inputs are sourced locally. This has greatly reduced the miles on my truck and the transportation of commercial fertilizers that would

otherwise be needed. This is a great win for everyone, our economy, both local and nationally, our roads, and our environment. Plus a greater supply of dairy products! The expansion of West River dairy would create more opportunities for me and others to grow this relationship across additional acres. Riverview has been very good to work with, and I appreciate how they show a respect for their neighbors and our government agencies at all levels.

As a neighbor, I am in favor of the West River expansion, and it is my hope that the MPCA can see the benefits as well.

Thomas Borgen **Letter 73**

I have been on site at multiple Riverview dairies and can't believe how clean and functional these sites are. I believe they are a value to the community and to the economy to the surrounding areas. Milk and cheese are part of the daily routine of many people and we need to keep the commodity healthy and strong for our own economy.

Perry Skaurud **Letter 74**

I am a farmer who works with Riverview Dairy in our area. They have been an incredible positive influence into our township, county, our churches, our schools. They do exactly as they say they will do. With this we have a very trusting relationship, (something that's hard to find these days). I believe our state agenceys have also found this all to be accurate statements. Riverview follows the rules to the letter of the law, and if they have a mistake or accident. It will be corrected or fixed, whatever is needed for a solution. They are very sensitive for neighbors, the environment and their relationships in the communities they have facilities. Their facilities are a standard above all I'm aware of in Minnesota. Incredibly clean, odor controlled, their employees are great to work with. When they were first considering a facility in our region and those few concerned citizens who had some oppositions, have had a complete change of mind after touring the facility and being a neighbor now for several years and seen how Riverview does business and treats the region, have no concerns and are very supportive. With the above statements in consideration, I fully support Riverview's permit for its West River Dairy expansion.

Sincerely, Perry Skaurud

Angela Anderson **Letter 075**

This proposed operation is the first of this size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities and our natural environment. The existing West River Dairy operation in Stevens County wants to dramatically expand its footprint.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. The Pomme de Terre River watershed where the expansion is located is a tributary to the Minnesota River, is already considered impaired. Because of the lack of detailed information about the groundwater situation in Stevens County and the unprecedented size of this operation in Minnesota I believe an EIS will be needed before allowing this expansion. I hope the findings of the EAW will show the way.

Kimberly Bemis **Letter 76**

I am extremely concerned about the run off from the lot entering local water ways. We will need mitigation strategies detailed, emergency plans in case of natural disasters, and continued testing of down stream waterways should this gain approval. The land is not meant to hold nearly 20,000 cattle in such a small area.

I'm also concerned about how they plan to staff their facilities. As I understand, labor has been difficult to obtain and the rumors indicate Riverview uses undocumented workers to fill their ranks. A detailed examination of their payroll should also be taken before allowing such an expansion project as well, though I'm sure that falls to a different department.

Jim Murn **Letter 77**

I am in support of approving the Riverview LLP's proposal to expand their West River Dairy operation. As an agronomist for a farm that has worked with the Waukon Dairy in Gary, MN since its inception, I can't say enough good things about Riverview and the people that work for them.

I am confident their proposed expansion is as well thought out and environmentally sound as any of their existing facilities. You won't find a better dairy operation that cares for its cows, its employees, the environment AND its neighbors (farming or not).

In today's world, the synergy that is generated when local crop farms get together to raise feed for one of these dairy's is the best thing in the long run for all participants: The dairy gets the feed they need at a fair price, we pay for and utilize their manure for the crops we raise, we get a price for our crops that is at a premium to bringing it to town. PLUS our region gets additional residents that would otherwise not be here. And it keeps building from there. Simple economics. Just at more efficient scale to fit today's world than the original dairy and crop farms of years ago.

Adding capacity to an existing dairy in the Riverview system can only increase the potential for farms in the area to participate in the synergy and success that is the result of this animal-crop production relationship.

Sincerely,

Jim Murn

Sydney Bauer **Letter 78**

As a resident of Stevens County I am deeply concerned about the environmental impacts that a project of this scale could have on my community, my state, and the downstream waterways. I think a full, thorough Environmental Impact Statement is necessary for a project of this novel size.

The GHG testing done in this EAW should account for the total number of cows in the facility, not just for the intended additions. An analysis of simply the increased number of cows DOES NOT equate to the total impact of the facility on water, land, and rural economy. If this facility needs 13,200 acres of farmland for manure application, this should be further looked into. The impacts of this facility will not just be within the confines of its property. I would like to see an EIS that takes into account how the 13,200 acres of farmland and their surrounding areas will be impacted.

The location of this facility is within the Pomme de Terre watershed, just 25 miles north of its confluence with the Minnesota River. The EAW does not provide enough detail into how this will affect our downstream neighbors from here to the Gulf. This EAW does not provide enough detail into how it will affect our water resources in Western MN.

As someone with dairy farming family members, I am also interested in this project requiring higher scrutiny for how it will impact small and medium sized dairy farms. Will this project impact the milk market in unsustainable ways? Will this project support local economies across the state in keeping their family farms afloat? What is the pattern of small and medium family farmers in Stevens County and the surrounding area?

I am also concerned about a facility of this size being granted permitting access without a full EIS because of Riverview's history of manure spills and water overpumping. This project will need 250 million gallons of liquid manure storage waste. I believe there should be scrutiny here to assess the impacts of this facility on communities, especially if these facilities have had already spilled their waste in our rural communities (Kandiyohi County). This EAW does not look at the impacts these spills have had on our communities. Riverview also just made an agreement with Arizona communities to pay $11 million dollars as a result of their overpumping the aquifer. This EAW does not look at the impact this facility will have on water resources with enough detail.

A full EIS is required to better understand the impact of this novel and impactful project. As a resident of Stevens County and someone who cares about considering the future of our local economy and natural resources, this project should require a full Environmental Impact Statement.

Miriam Gieske **Letter 79**

As a resident of Stevens County MN, where the proposed Riverview Dairy expansion would be located, I am concerned about its environmental impact and would like the MPCA to require a full Environmental Impact Statement before the project can go forward. This project would more than double the size of Riverview's dairy operation in Stevens County, with the final size being almost twice as large as the next largest livestock operation in our state in terms of animal units. A project of this unprecedented scope demands particular care in reviewing its impacts, which a full Environmental Impact Statement would provide. In addition, I believe it is important for the EIS to take into account the total projected size of Riverview's Stevens County dairy operations, including existing animal units, not just the size of the expansion. Total size matters because the larger the total size, the larger the potential impact if something goes wrong. For example, Riverview's Feb. 2025 manure spill in Kandiyohi County likely spilled approximately the same amount of manure in 5 days that an average sized MN dairy farm would produce in 6 months, based on early reports.

Nate Hultgren **Letter 80**

We write this letter in support of the West River Dairy expansion. Our family farms next to another Riverview dairy (Meadow Star near Pennock, MN) and can sincerely say that our experiences with Riverview have been positive for our family farm.

Applying manure each fall instead of commercial fertilizer has been a documentable soil health improvement. Instead of buying fertilizer from across the globe and incurring all of that shipping cost and environmental impact, we are getting our nutrients from one mile away. We also raise forages--silage and alfalfa. The alfalfa in our rotation has also helped improve soil health and the perennial vegetation fights soil erosion. Raising the silage and selling our dry corn to the dairy, here again, takes truck off the highways where we might have incurred 10-15 miles hauling product to elevators.

Riverview's sites are clean and well-maintained. Their employees, some of whom live on-site and are our neighbors, are respectful, clean and quiet. The dairy makes sure to take care of the roads around the site, and collaborates with us as neighboring farmers to make sure the site is living up to high expectations.

Riverview supports our local communities and has filled an economic development void in an otherwise declining commercial area. Our family has been able to participate in helping with forage production, manure application, and community events.

We stand in full support of the West River Dairy expansion as we know from experience that Riverview will conduct this expansion with no compromises of safety, environmental protection, and attention to detail. The community will benefit from this expansion.

Sincerely,

Nate & Jaime Hultgren

Cameron Berthiaume **Letter 81**

I am concerned about the impact of this project and believe it needs a full environmental impact statement. I would also like to request a public meeting regarding this project if possible. As a Morris resident, this project is close to home.

Looking through the documents and looking at the maps, I see that there are prairie conservation areas and at least one area important to birds (attachment 7c) - having ecologically significant areas nearby merits careful investigation of the potential impacts of such a large project. There are also lakes that support biodiverse populations (7d).Though page 53 of the EAW says that project areas were changed to avoid overlap, "...the DNR noted that the Minnesota Biological Survey (MBS) identified one or more sites of Biodiversity Significance adjacent to some of the proposed manure application areas (Attachment 7d)... in all cases, these ecologically significant areas are outside the tillable fields designated for manure application." Even if manure application guidelines are followed, I believe the impact of areas adjacent to these ecologically significant zones warrants more investigation. Just because an activity does not take place directly on the ecologically significant land does not mean it will not affect said land - adjacent is still nearby enough to be important. I also see that some of the manure application areas are near the Pomme de Terre River, in some cases right up against it.

I am also concerned about the amount of water used. Hundreds of millions of gallons per year is an incredible amount that's hard to conceptualize. I am glad that there will be pumping restrictions, but these restrictions seem to target shorter lengths of time (years or seasons). More consideration must be given to the long-term impacts of utilizing the area's aquifers. When all the water use around the facility is considered (more ag and nearby communities), the amount is staggering. Is there data that can verify the water used by this facility won't deplete the aquifers faster than they can recharge?

Also, talking climate change - I read the section of the EAW on greenhouse gas emissions. Efficient practices and carbon sinks help, but they can't do it all. More cows means more methane.

My final thought - I would like to see more in-depth data on the hydrology of the area, including the aquifers. A fuller picture and better understanding of the area's groundwater resources must be gained.

I appreciate the work that has been so far, but a closer look is necessary.

Lizzy Haywood **Letter 82**

The West River dairy expansion, proposed by Riverview LLP, is a project that must be preceeded by an EIS. The size of this project is something MN has not seen before and must be measured and evaluated through the accepted methods of an EIS.

I believe that careful evaluation of projects like this can ensure rural Minnesota's environment is protected, and that agriculture can thrive.

With a project of this size, the mpca should NOT set a new precedent of not evaluating effectively. For the healthy future of Minnesota's farm economy and water quality, require the EIS for the West Dairy Expansion.

Thank you,

Lizzy Haywood

Mary Ellen Frame **Letter 83**

The application of Riverview LLP is of such enormous proportions that a full Environmental Impact Statement must be filed with MPCA. Damage to the environment, local residents, and economy seems inevitable with such a monstrous, industrial entity in a vulnerable rural area--or anywhere else.

Gabriela Santiago **Letter 84**

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

Naomi Skulan **Letter 85**

As a resident of Stevens County, I am incredibly concerned about the possible environmental impacts a dairy operation of this size would have. Without a full Environmental Impact Statement, we won't know the costs this massive operation would have on the local waterways and land until after the damage was already done. In particular, I am concerned about manure spills and protection of our waterways and waterfowl and wildlife production areas. A farming operation of this magnitude should have a full Environmental Impact Statement completed before being allowed in operation.

Danielle Green **Letter 86**

As a Stevens County resident, I'm concerned about the potential environmental impact of the proposed Riverview Dairy expansion and think the MPCA should require a full Environmental Impact Statement before the project moves forward.

This expansion would more than double Riverview's dairy operation in Stevens County and make it much larger than any other livestock operation in Minnesota in terms of animal units. A project of this size really deserves a thorough environmental review.

Any review should look at the total size of Riverview's Stevens County operations, not just the proposed expansion. The larger the operation, the greater the potential impact if something goes wrong. Recent events, like Riverview's tank failure at Meadow Star Dairy near Pennock, show why careful review matters when operations reach this scale.

There's also precedent for this. In 2014, the MPCA Citizens' Board required a full Environmental Impact Statement for a proposed 8,850 cow Riverview dairy in Stevens County because of concerns about water quality, water use, and cumulative impacts. A full EIS makes sense for projects of this scale.

Gwendolyn Fassett **Letter 87**

This Riverview-proposed expansion of West River Dairy MUST have an EIS before it goes any further. It would be the largest CAFO in the state, when we should be moving rapidly away from CAFOs toward more sustainable forms of agriculture. We can't afford the amount of water it would require, let alone the potential for pollution of the water and land around it! Please do a thorough study, not a performative one! Thank you!

Bonnie Haugen **Letter 88**

Bonnie Haugen comment on West River Dairy Expansion Farming is Everybody's Bread, Butter, and Water. What I do on my hills affects water quality and quantity for Everybody.

I am a retired dairy farmer. Our family milked 100 – 200 cows 1994 until 2024. Due mostly to unstable and low milk prices, we ceased shipping milk and transitioned to a beef farm. The pressure from the existing large Confined Animal Feeding Operations (CAFO) dairies is causing harm to our milk markets for many farmers. They can flood the market, tip the market to a monopoly, and create unfair financial pressure on the existing farms. That pressure makes the milk income price fluctuate and unsustainably low. Farm families quit milking or sell the farm business. Therefore, our towns receive less business, and the community struggles.

A Full Environmental Impact Statement (EIS) is needed.

I was a member of the Southeast Minnesota Nitrate Strategies Collaborative Work Group. I learned about water quality and quantity issues during our meetings July of 2024 through June of 2025. One of those issues which comes to mind when I think of this permit application is related to the feed for the 18,855 cows. Certainly, containing and spreading the liquid manure has many concerns for people's safety, the high risk of contaminating water, air, and ground. However, I was surprised to learn that it is raising the feed that often causes more of a nitrogen problem. Corn, a major feed component of dairy cows, is a monoculture crop. When nitrogen is applied, its easily overapplied.

Further, in these unprecedented weather events, a farmer may apply nitrogen pellets in good faith, but a rain of surprise timing and deluge can wash it away, polluting our water and giving the farmer cause to apply more fertilizer, risking more nitrogen going into our drinking water. Cover cropping, precision application, and following recommendations alleviate nitrate runoff and improves soil health. Yet, following regulations does not always protect our environment. Weather events can cause catastrophic overflows, cracks or leaks in structures and hoses happen.

A Full Environmental Impact Statement (EIS) is needed to better minimize the huge risks this huge business proposes. The environment and people in that region and watershed deserve a EIS be conducted with integrity.

Water tables, aquifers, streams, creeks, pathways do not abide by township, county or state borders. This proposed expansion is within five miles of eight different waterfowl and wildlife production areas. Allowing the pumping of 226 million gallons of water every year needs study. Can the aquifer handle that much additional drawdown and not cause issues of quantity or quality for the existing towns, rural wells, farmland, and rivers? Can the watershed survive? I think a full study needs to be completed before a decision can be made on permitting this size of an industrial agriculture business.

A Full Environmental Impact Statement (EIS) is needed.

Manure lagoons and miles of hoses also give me concerns for people and water safety. Lagoons of these sizes can be very risky. Man made structures fail eventually. But even if not often, when a hose or

lagoon of these sizes leaks, the pollution is not easily or quickly cleaned up. The risks of this size need extra special study before permitting.

A Full Environmental Impact Statement (EIS) is needed.

There are not other CAFO's of this huge size in our state. There are studies showing the social and economic effects of CAFO's on our communities. Should we assume that those same effects will be the same except the impact will be huge, as the CAFO is huge? We should not make uneducated and unresearched guesses before allowing a permit for this size CAFO.

A Full Environmental Impact Statement is needed.

Thank you for your needed attention to this critical nature of this threat to our environment and people.

Respectfully,

Bonnie Haugen

Maddie Brown **Letter 89**

I am a concerned citizen from Southeast Minnesota. I appreciate the opportunity for public comment on this EAW for the West River Dairy Expansion. Based on the EAW, I see a clear obligation for MPCA to issue an EIS on this project.

The MPCA has the statutory obligation to issue an EIS in this instance. Minn. R. 4410.1700, subp. 1 states that the MPCA must order an EIS for projects that have the "potential for significant environmental effects." The criteria for significant environmental effects includes the cumulative potential effects (as stated in Subp. 7 of the same statue). Similar dairies of the proposed size (a combined total of 26,397 AU), have shown clear cumulative impacts to surrounding communities including groundwater nitrate contamination, odor issues, reduced air quality (particulate matter/ammonia), increased greenhouse gases, and increased water consumption. As it stands, the EAW does not provide sufficient information (as referred to in Subp. 2a) to fully quantify these likely impacts. Therefore West River Diary Expansion clearly meets the criteria that mandates MPCA must issue an EIS.

Allowing the proposer to create the largest mega-dairy in Minnesota without the due diligence of an EIS would be an insult to family dairy farmers across the state who are struggling to survive while doing the right thing. In addition, by not issuing an EIS, the State risks allowing the proposer to pollute our waters at no cost to them, pushing the bill for cleanup onto future taxpayers. Dairies of the proposed size can pose an economic threat to family farms, a hazard to the health and wellbeing of rural communities, and can become a costly burden to taxpayers in the long run. Citizens deserve to understand the full risks of the project without the MPCA rubber stamping its approval.

I urge the MPCA to uphold their statutory obligation and issue an EIS on the proposed West River Dairy Expansion.

Diane Michelfelder **Letter 90**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

I think an excellent source of information about the risks of CAFOs on water quality can be found in a publication from the journal Environmental Health Perspectives. I respectfully would like to call it to your attention by uploading it here as a .pdf. It is also available on the National Library of Medicine website.

Yeshwant Kethineni **Letter 91**

Given Riverview's history of manure spills, water use and water overpumping, I would like there to be testing / research done on how this may affect water resources in the area

Emily West **Letter 92**

Feedlots destroy land, water, and nearby residents' quality of life. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Nathan Koehl **Letter 93**

My name is Nathan Koehl and I have lived in the area surrounding existing sites for most of my life. We have never noticed any changes or negative impacts on our well water quality or quantity. We also have worked closely with sites in our area for manure application. The application is always carried out responsibly and with utmost care for neighbors and farmers in the area. Soil sampling and monitoring has been diligently followed so that soil and water health are maintained. Manure has helped support us in serving our soil better and has allowed us to raise healthier and more sustainable crops on our ground.

The crews that work with Riverview to harvest their crops are always very respectful and maintain road quality, manage dust properly, and make sure that neighbors and safety are top priorities. As a long-time neighbor to Riverview I encourage the MPCA to approve the expansion permit for West River Dairy.

Thank you.

Melissa Swenson **Letter 94**

This project is too large and potentially environmentally destructive to the area. Please make an informed decision by having a fair environmental study completed. Better to be safe than sorry.

Rebecca Tryon **Letter 95**

The Riverview Dairy project must be required to get an Environmental Impact Statement. The potential for a profound impact on local water resources is too substantial to ignore based on data from other large animal agriculture projects. Please require a more extensive review of the potential harms before implementing. The land of 10000 lakes should protect its greatest resource

David Smith **Letter 96**

The Riverview Dairy project must be required to get an Environmental Impact Statement. I am very concerned of the impact the Riverview Dairy will have on the environment. It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Anna Kilian **Letter 97**

Hello I am a resident of Stevens County and I have concerns about the new expansion of the Riverview dairy lot. I am requesting a full Environmental Impact Statement (EIS) be made to help guide the planning of this expansion.

I have done a general review of the environmental assessment worksheet (EAW) and see the beginnings of plans to lower the impact on the environment. I am concerned that not all plans have been throughly fleshed out. Such as "Increase impervious surfaces by 121 acres" and "increase in manure storage". In the last year Stevens county and surrounding areas were heavily impacted by above average rainfall in short windows with 5+ inches in a 24 hour period. I think a full EIS will help ensure that the EAW plan will prevent further road floodings, sediment deposition in the river, wildlife impacts, and any potential leaks of manure or other hazardous materials into the pomme de terre river. This feedlot will have environmental impacts and I wish to see all plans to minimize these as much as possible with an EIS.

Thank you for your consideration and work to help make this dairy lot possible. I recognize the importance of having animals to feed the country, and as an avid cheese fan myself I am not against the expansion just want to see a full Environmental Impact Statement to help prevent irreversible damage to the prairie and wetlands around my home. We have few chances to keep our environment safe and look forward to this lot not being part of the problem.

Ian Hoxworth **Letter 98**

We don't need expansion of a plant that creates more environmental disasters.

Sarah Hollinger **Letter 99**

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment

Eric Zeltwanger **Letter 100**

I fully support Riverview in the expansion of West River dairy. They maintain their sites impeccably and are great neighbors. I consider myself lucky to be able to see modern ag at its finest close to my home. Thank you

Andrew Falk **Letter 101**

This must have an EIS. This is not farming but an industrial scale operation. Riverview is nothing more than a corporate entity. It has Human Resources departments, accounting departments, logistics departments, lobbying efforts, all the things that a large corporate business entity has; not a family farm.

Please do the right thing and require an EIS.

Benjamin Koehl **Letter 102**

My name is Benjamin Koehl, I am a resident of stevens county, I have grown up with riverview dairys around my home all my life. Riverview has been a huge asset to the stevens county area supporting the community with jobs for electricians, plumbers, construction workers farmers,truckers the list goes on, and also not to mention all the workers that are brought in to work spend money in the county which

help boost our local economy. As a farmer riverview takes care of the land they are very careful on how and when they put on manure they are easy to work with as well. The manure is a huge benefit to our soils boosting microbiology, organic matter and providing a cheap source of fertilizer for us as the farmer. As a farmer riverview gives us the farmer to have different crops like alfalfa in our rotation to diversify, and offers a positive basis for our corn for corn silage.

Whenever I see somthing done by riverview its always done 110% and better than the status quo. When i drive around the current west river dairy site the feed and manure runoff is properly contained to avoid runoff everythings "tour ready" whenever i drive around. In conclusion to the matter I am in full support of the west river dairy site as a local Stevens county citizen.

Beth Kieffer **Letter 103**

Where is all this water coming from? Where will all the manure be disposed of? Not a good move.

Cathy Solvie **Letter 104**

I think the Riverview is large enough and already uses way too much resources to let this expansion happen. You need to think of the pollution that could happen and this expansion will only put more money in the pockets of people who have more than enough already.

Brandon Semel **Letter 105**

This proposed dairy is enormous, and it will create waste and resource demands greater than entire towns. It would be irresponsible not to require an EIS be completed to ensure that the proper safeguards are in place prior to the approval of this expansion.

Terry Maloney **Letter 106**

This will affect everything and everyone in the area. It will suck the life out of the surrounding area where they get their water from and drain their manure to. Maybe not right away but when it does, it will be too late! They're big enough, there's no need to get bigger. They only want to fill their pockets. They have no regard for the community. LEAVE OUR COMMUNITY ALONE!! It's perfect the way it is right now and so is Riverview there's no need for it to get bigger! Who's this going to benefit...Riverview and only Riverview...Ugh.....

Sylke Boyd **Letter 107**

I am concerned about the impact of this facility on several factors: (1) the ground water supply, (2) pollution of the surface water shed, (3) increased traffic, (4) the welfare of the animals involved, (5) further degradation of the soil, biodiversity, landscape of the county. This project should undergo much scrutiny in terms of the true necessity to further degrade our natural resources. I am opposed to sacrifice them for the increase in wealth and influence of a corporation that has previously shown to act irresponsibley with public goods.

Agnes Dieter **Letter 108**

Rural Minnesota is constantly fighting to keep local business, agriculture, and resources protected and local. Allowing Riverview to monopolize the dairy industry is not conducive to the tenants that make rural Minnesota what it is. The pros — more jobs and expanded industry — do NOT outweigh the possible economic, environmental, and social cons. Depleting and/or damaging a county's resources to

further the monopolization agenda is not sustainable in rural Minnesota. Resources, such as water, are already at an environmental risk at large in this country due to other risk factors, that putting Steven's county on the map for danger to water only furthers the risks already in place. Riverview may want to think they deserve to be a monopoly, or titan of industry, or some other self-imposing title, but no amount of money or veiling should make a county turn a blind eye to the risks of our natural resources, land, and local community and economy.

Alia McIntosh **Letter 109**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now:

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kathy Dunn **Letter 110**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Grant Ascheman **Letter 111**

My name is Grant Ascheman.

I am a resident of rural Swift County, Minnesota. I am 28 years old and have lived here my entire life. My family farm lies 1 1/2 miles from Stevens County the county where the West River Dairy expansion is being permitted. I strongly support the expansion and the approval of its permitting.

Riverview has been and continues to be an excellent company in both Stevens and Swift counties. They are a great employer in these counties that continue to see populations declining. Providing good jobs in our local community.

As a farmer they have provided our family the opportunity to sell silage corn to them providing an alternative and local end user market for our crop. I have personally helped with harvest at 2 of Riverview's dairies in Stevens County and another in Swift County. Riverview goes above and beyond in regards to being good neighbors. During their harvest season they take great safety precautions, maintain dust control on gravel roads, and avoid their harvest equipment meeting on the road whenever possible. All at their expense to be neighborly.

Our family farm has also had the opportunity to purchase manure from Riverview to apply as fertilizer on our land. They are diligent in testing the nutrients in the soil and manure prior to application to assess appropriate application rates. This process maintains environmental excellence while providing our land with the necessary nutrients needed to raise great crops in Western MN. We have seen great benefits to our soil health from these manure applications and they will continue to be a benefit to our land into the future.

Riverview's sites are extremely clean and well maintained. They have maintained this excellence for decades in Stevens County.

I believe Riverview will not compromise on safety, the environment, or being good neighbors in this expansion. For those reasons I stand fully in support of the permitting of this expansion and believe it will be a great benefit to our community.

Sincerely,

Grant Ascheman

Jennifer Keller **Letter 112**

As someone who values protected areas and watersheds and all natural resources in general this expansion should not be allowed until a thorough assessment is completed. Furthermore, Riverview has shown that they overuse resources as evidenced by their Arizona locations. In addition, there are days that it smells extremely pungent in Morris, so much so that I, who suffer from asthma, have issues going outside due to the overwhelming odor of manure. Expanding would only make that problem worse and hinder people from enjoying the outdoors. So I urge you to fully study the environmental impact, including air quality before allowing this expansion. I, for one, am vehemently against this.

Wesley Sisson **Letter 113**

I submit the following public comment regarding the proposed expansion of the West River Dairy operation. As a citizen concerned with environmental stewardship and the long-term sustainability of Minnesota's natural resources, I urge the MPCA to carefully scrutinize this proposal and consider the substantial risks associated with creating what would become the largest concentrated animal feeding operation (CAFO) in the state.

Large-scale CAFOs pose significant environmental challenges, particularly in regions where groundwater, surface water, and rural community health are closely interconnected. The proposed scale of the West River Dairy expansion raises several concerns that warrant heightened regulatory review and public transparency.

First, manure management at this scale presents a serious risk to water quality. With thousands of dairy cattle producing millions of gallons of manure annually, the potential for nutrient runoff, nitrate contamination, and phosphorus loading into nearby waterways increases dramatically. Minnesota has already experienced widespread nitrate contamination in groundwater and harmful algal blooms in lakes and rivers due to agricultural runoff. Expanding the state's largest CAFO could exacerbate these existing challenges, if manure storage, land application, and monitoring systems fail or are overwhelmed.

Second, groundwater protection must be a central consideration. Much of rural Minnesota relies on shallow aquifers for drinking water. Studies across the Midwest have demonstrated that large livestock operations can contribute to nitrate contamination of groundwater through manure seepage, over-application on fields, or extreme weather events. As climate change increases the frequency of heavy rainfall and flooding, manure lagoons and storage systems face greater risks of overflow or leakage.

Third, the cumulative environmental impact of such a large operation must be evaluated, not merely the direct facility footprint. The transportation of feed, manure spreading over wide land areas, increased truck traffic, and air emissions which include ammonia and methane can affect surrounding ecosystems and nearby residents. Air quality impacts, odors, and particulate matter are well-documented concerns associated with high-density livestock operations.

Fourth, the scale of this proposal raises broader questions about agricultural sustainability in Minnesota. While dairy farming is an important part of the state's rural economy, the consolidation of livestock into extremely large operations can create environmental risks that smaller-scale systems distribute more sustainably across the landscape. The MPCA has a responsibility to ensure that economic development does not come at the expense of Minnesota's water, soil, and public health.

For these reasons, I respectfully request that the MPCA:

1. Conduct a thorough and transparent environmental review of the proposed expansion.

2. Require rigorous groundwater monitoring and publicly accessible reporting.

3. Ensure that manure management plans account for extreme weather events and long-term soil nutrient loading.

4. Evaluate cumulative environmental impacts, including air emissions and watershed-level nutrient pollution.

5. Provide meaningful opportunities for public participation and community input before any final approval.

Minnesota's lakes, rivers, and groundwater are among the state's most valuable natural assets. Decisions regarding large-scale agricultural developments must reflect a precautionary approach that protects these resources for future generations.

Thank you for considering these comments.

Respectfully submitted,

Edwin Garcia **Leetter 114**

Given the fact that the company has been sued for over usage of water, and not caring for the well being of it neighbors, I am saying no to the expansion.

It's a only a matter of time they drain the resources from the area and move on to the next state.

Douglas Hauge **Letter 115**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Catherine Day **Letter 116**

I support a strong environmental impact review for this project. The scale of the proposed farm is too large and will have a negative effect on the river and the ecosystem of the area.

Kristi Trout **Letter 117**

I do not think this expansion should be allowed to go through. This area used to be known for small family owned dairyfarms, providing livelihoods for hundreds of families. These big companies have come into farming communities and taken over. Today, if one where to around drive around this area, they would be hard-pressed to find more than a couple of small family dairyfarms. We also need to protect our lakes and rivers, the environment as a whole, needs to be taken into consideration. We need clean rivers, as well as lakes. Producing that much manure and using that much water from the existing facility is enough, we don't need more added to the environment. Let's also take into consideration the livelihoods of small family owned dairyfarms.

Laura S **Letter 118**

No, I do not support this expansion. I understand it would bring work and economic growth to Morris, but destroying our watershed isn't the way to do it. Pomme de Terre has a special place close to my heart because I grew up less than a mile from it and often times fished, threw pebbles, and just enjoyed the water. Please don't ruin this river! It's my childhood and so many others, on a personal level.

Cecily Melde Erickson **Letter 119**

This must have an EIS. This is not farming but an industrial scale operation. Riverview is nothing more than a corporate entity. It has Human Resources departments, accounting departments, logistics departments, lobbying efforts, all the things that a large corporate business entity has; not a family farm.

Please do the right thing and require an EIS.

Gail Johnson **Letter 120**

No. Provide more opportunities to the young independent generation of farmers to take over and manage their family farms. Excessive water use and concentrated gastly waste managment can not creep into Minnesota. The pararie lakes, rivers, beautifully scenic crop fields, and vacation areas are too precious to the Minnesota econony.

Sammy Johnson **Letter 121**

I vote no. We don't want this. The land should go to the local farmers and their families that will take over the farming business for years to come.

Kristin McNeill **Letter 122**

We live a couple of miles from the West Riverview location and have lived here most of my life. What about our water? We've already seen a noticeable decline in water quality. When our well needs to be dug deeper - or even relocated - because they have pulled the level so far down, will they be footing that bill? Will there be any concern for the neighbors?

Cassandra Carskadon **Letter 123**

Already water is a precious resource. We already have corporations trying to take this precious resource for various enterprizes. There is no need for this expansion. Especially when you're not done doing all the research about ground water in the area.

Jeremey Katopol **Letter 124**

The proposed feedlot is high risk from both an environmental and economic standpoint. Please do not allow them to destroy our water further.

Jacqueline Hadrath **Letter 125**

No to the expansion. Save our small farmers and the land!

Fred Tio **Letter 126**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kay Slama **Letter 127**

Require a Riverview Dairy EIS!

I taught some courses at UM_Morris and worked at the Stevens Community Medical Center in Morris MN. At the latter job, I occasionally treated workers at Riverview Dairy. I also enjoyed the natural areas around Morris, such as the Big Stone National Wildlife Refuge and the Edwards Wetland Management Area, which, along with the city, depend on good water levels and good air quality.

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Charlie Rea **Letter 128**

Please for the sake of the local people, animals, and land do NOT allow this to happen! The long term effects will be un-doable and will negatively impact so many. Please keep things as they currently are i beg of you

Kathryn Droske **Letter 129**

I have lived and worked in Morris and currently raise cattle in a nearby community. For the sake of the community, the waterways, and wildlife, the unprecedented expansion proposed by Riverview must be subject to a full environmental review.

Kelli Olson **Letter 130**

Living not far from this dairy(within 30 min) I have already seen first hand how this large operation has taken over so much farmland as small families cant even compete with what they pay for land and dont feel this would help change that. I think this would be a big mistake!

Joel Hoffmann **Letter 131**

No, there will be no small farms left if Riverview keeps expanding . Greed is destroying AG and ruining opportunities for young people to milk cows or join agriculture. Not to mention Riverview draining wells of water .There is no reason for anyone to milk 100,000 cows and more . And have all the workers be visa workers it's really sad what they are doing to Dairy and destroying small communities economy's . Bring back small farms and stop with corporate farms and greed. Pretty soon it will just be Riverview being the only dairy farm in MN

Eric Koehl **Letter 132**

I am in favor of the West River Dairy expansion. We live and work close to the Riverview and D45 dairy sites. The sites are kept super clean and have very little odor. The dairies we live next to provide and economic engine for other businesses and a healthy tax base. The dairies we live next to are good neighbors. We feel the West River, Riverview and D45 dairies are a synergy for our farm and community.

Thanks, Eric

Brenna Rollie **Letter 133**

Absolutely NO! CAFO is just a creative way to use language that doesn't say factory farm and industrial scale farming.

Robert Filipczak **Letter 134**

Please don't let this happen. We need smaller farms, not factory farms.

Jeff Engebretson **Letter 135**

Today's money grab industries should really feel how the communities and environment can and will be affected from decisions that are solely based on profits.

The impact that this will have to our water sources and environments are and can be detrimental to a wide range of areas. The Pomme de ter reaches into three other major water sources and if you think there won't be an impact done because of runoff and seapage you are mistaken.

This is a no-brainer and it should be stopped from happening. Not to mention the little farms that it will crush a long the way. Absolutely disgusting and when you think of rural Minnesota you definitely don't see this as being a community driven outcome.

Stop this from happening.

Julie Lloyd **Letter136**

There is way too much at stake here. There must be more information gathered before a decision of this magnitude is made without considering all the ramifications. We must protect our water and our family farms!! This huge operation will not only destroy the environment, but will also destroy many small farms. THIS IS NOT PROGRESS.

Sue Bruer **Letter 137**

I am very concerned about the impact of this facility for several reasons: 1) ground water supply, 2) pollution of water shed, pollution of soil and biodiversity, and 3) impact on small family farms in the area. A full EIS needs to done to understand the impact of this project. Also, past history with previous Riverview projects need to be taken into account. An undertaking this large is sure to create unseen problems. Please be diligent in all aspects of researching this project.

Thank you

Tracy Zickur **Letter 138**

Why award this to a company that has already shown gross misuse of and harm to resources that are beneficial to native species of plants, animals, and residents of the areas they occupy? The fact that they so closely border 5 different land areas already should be enough to warrant a veto of their expansion.

Christine Newcomer **Letter 139**

No

Diane Baum **Letter 140**

why is it we here in Morris were not IMMEDIATELY made aware of this??? Our watershed is already being contaminated by high levels of nitrogen from farming, to add more cows to this is deterimental to our well-being and way of life. Look to Arizona, what Riverview is doing there, they are using up all of the water there!

https://www.youtube.com/watch?v=MRCD_jFsMVo&t=22s

Sheryl Lyke **Letter 141**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Edith Thiel **Letter 142**

Commenter requested this comment be removed from the record. See **Letter 489** by same commenter.

Greg Anderson **Letter 143**

Riverview should not be allowed to expand on this sight. IMO they are responsible for the degradation of the Gorder Lake water quality by way of nutrient runoff coming from the excessive manure application of the fields they cut for silage. This degradation has resulted in water that is green all year around, has no fresh water shrimp in it (Gorder and all of the surrounding waters use to be teaming with aquatic invertebrates) and is no longer of use to migrating waterfowl. Riverview has artificially driven up the land values making it very difficult for the local farmers to purchase land without repressive debt. Riverview refuses to enter written contracts for silage with local farmers so that they can back out of their commitment if bad weather damages the corn.

How much milk did Riverview donator offer to sell to local school districts during the milk shortage a few years ago?

Riverview imports all of their labor force from Mexico which leaves locals with no chance at a job.

Tyler Solvie **Letter 144**

I am a lifelong resident of Stevens County, and I am writing to express my full support for the West River Dairy expansion.

I am a local farmer and have had the opportunity to work with Riverview through silage production and other farm-related work. Riverview has consistently been a positive and reliable partner. Each dairy provides silage and forage opportunities that support local farming operations like mine, allowing me and other neighboring farms to remain productive, especially during the off-season. Riverview also creates opportunities for many other local businesses, helping strengthen the economy in the areas where they operate.

Riverview is required to follow strict manure application standards, and they take those responsibilities seriously. Manure application is carefully managed and based on crop needs and soil conditions, while following regulations designed to protect land, water, and the environment.

Riverview's sites are clean and well maintained, and their employees are respectful and easy to work with. Communication has always been strong, and they make sure operations are handled responsibly.

I fully support the West River Dairy expansion and believe Riverview will continue to be responsible stewards of the land and the communities where they operate. This expansion will provide ongoing benefits to local farmers and the surrounding community.

Thank you,

Tyler Solvie

Megan Helling **Letter 145**

Riverview, LLP has applied to house an estimated 26,397 dairy cattle at a single site, an alarming proposal that would represent an unprecedented scale for dairy production in Minnesota.

A full Environmental Impact Statement (EIS) must be required. An operation of this size presents complex and far-reaching risks to water quality, air quality and surrounding ecosystems in addition to serious animal welfare concerns that cannot be adequately evaluated through a more limited review.

The proposed expansion also raises concerns for Minnesota's small independent farmers by placing additional economic pressures to those who are already struggling to compete in an increasingly consolidated market.

Minnesota must ensure that decisions of this magnitude are made with public transparency, complete information and careful consideration for the long-term sustainability of our environment.

Steve Deslauriers **Letter 146**

As a resident of Stevens County MN, where the proposed Riverview Dairy expansion would be located, I am concerned about its environmental impact and would like the MPCA to require a full Environmental Impact Statement before the project can go forward.

This project would more than double the size of Riverview's dairy operation in Stevens County in terms of animal units, and almost twice as large as the next largest livestock operation in the state. A project of this unprecedented scope demands particular care in reviewing its impacts, which a full Environmental Impact Statement would provide.

In addition, I believe it is important for the EIS to take into account the total projected size of Riverview's Stevens County dairy operations, including existing animal units, not just the size of the expansion. Total size matters because the larger the total size, the larger the potential impact if something goes wrong. For example, Riverview's Feb. 2025 manure spill in Kandiyohi County likely spilled approximately the same amount of manure in 5 days that an average sized MN dairy farm would produce in 6 months, based on early reports.

To ignore the potential environmental impacts of this expansion would be completely reckless. A full Environmental Impact Statement should absolutely be obtained before proceeding.

Micah Norman-Pace **Letter 147**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Operations of this scale are bad for animals, workers, and the environment in a myriad of ways.

Kersti Malmberg **Letter 148**

I think this expansion would be a catastrophic mistake. There is no need for a dairy operation that large, it would negatively affect the water first in the area surrounding the farm and spread out to the rest of the state and beyond. This drain on and contamination of natural resources is a colossal mistake in a very critic time for our environment. I'm staunchly opposed to this expansion.

Kimberly Milligan **Letter 149**

The Riverview Dairy project MUST be required to get an Environmental Impact Statement

Kimberly Milligan **Letter 150**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Deanna Arce **Letter 151**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Rachel Johnson **Letter 152**

I live in Stevens County MN, the same county as the proposed Riverview Dairy expansion, and I am requesting that the MPCA require a full Environmental Impact Statement before the project moves forward. The proposed expansion is significant and it seems only reasonable to expect a full Environmental Impact Statement. While I am happy that Riverview, an important part of our community in Stevens County, wants to invest in an expansion here, I do think it is necessary to require a full Environmental Impact Statement.

Rachael Rich **Letter 153**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Tracey Anderson **Letter 154**

10 March 2026

To: Minnesota Pollution Control Agency

From: Tracey Anderson

RE: Proposed Riverview, LLP 11,000-cow dairy feedlot in Section 1 of Synnes Township in

Stevens County

I am writing to encourage the Minnesota Pollution Control Agency to require a full environmental impact statement for the proposed expansion of Riverview's dairy feedlot (mentioned above.) I realize the Riverview is a successful agribusiness and brings much to our community, but the magnitude of this expansion is such that it poses potential threats to the environmental quality (land, air, water) in Stevens County. I believe these threats should be full investigated and necessary actions to prevent and/or mitigate environmental impact should be identified before the project moves forward.

More specifically, I am concerned about the potential impact that a dairy feedlot that is significantly larger than the current operation will have on water quality. I am an aquatic ecologist who has studied aquatic life in both the Pomme de Terre River and in local prairie pothole ecosystems. I value the opportunities to enjoy the natural resources that support fish and wildlife in our area and recognize that many depend on uncontaminated groundwater for drinking water and other household uses. Our freshwater ecosystems and connected ground water have the potential to be directly impacted by such a large dairy operation; I am concerned about both water quality and water quantity.

I think that before moving ahead with such a large project that the potential impact on the local environment should be investigated more thoroughly. This expansion will result in the largest dairy feedlot in the state of Minnesota. Given the magnitude of this dairy operation it believe it is essential that the MPCA and Riverview undertake the full Environmental Impact Statement process before this project moves forward.

Andrea Swenson **Letter 155**

Having this many animals in one area cannot be healthy to our waterways. This is just a big huge company thinking they can push us all around. I can't imagine trying to drill a well anywhere near there and think you're gonna get good clean water. You cannot let this happen.

Jennifer Winn **Letter 156**

As a former resident of NW Iowa - this sounds like a horrible proposal and sets future precedent that nobody wants. See the rates of cancer in Iowa? It's connected to the ag pollution in the air and water.

Don't make the mistakes Iowa has in terms of putting the profits of Mega Agriculture Monopolies ahead of the well being of the citizens in this community.

As a former organizer for Food and Water Watch - I saw the significant amount of environmental damage and quality of life degradation in my own community in Sioux County - which houses more factory farms than any other place in the country.

The nitrates in our water due to ag waste runoff was well above advisable levels, the cancer rates in that area of Iowa are especially high, not to mention every other illness related to breathing CAFO polluted air and drinking livestock waste littered water.

I'm thankful to live in Madison where we have a Reverse Osmosis treatment plant for our drinking water - but if this project comes to pass - expect that MANY more Minnesotans and everyone downstream from the waterways surrounding this expansion will have their health jeopardized just for Big Ag profits.

I very loudly and clearly disagree with this expansion proposal. Do what is right for Minnesotans, not the ag monopolies that leave our communities struggling economically and environmentally.

Cory Ahrens **Letter 157**

My name is Cory Ahrens, and I am a custom manure applicator who works with Riverview. I am writing in support of the West River Dairy expansion.

As a young farmer, the opportunity to work with Riverview has allowed me to build and grow my own business in manure pumping and application. Opportunities like this are not easy to come by, and the work Riverview provides has been a key part of helping me get started and stay involved in agriculture.

In my experience working with their sites, Riverview holds themselves and the people they work with to a very high standard. Their sites are well managed, clean, and professionally run. They take their responsibilities seriously and expect the same from their partners and contractors.

Riverview has also been a strong partner for the local agricultural community. Their operations support local farmers, contractors, and businesses, and the expansion of West River Dairy will continue to create opportunities for people like me who are working to build a future in agriculture.

I appreciate the chance to share my perspective and strongly support the approval of Riverview's West River Dairy expansion.

Sincerely,

Cory Ahrens

David Jungst **Letter 158**

I have two main concerns about the West River Dairy Expansion:

1. Possible depletion through over-pumping of the local ground water aquifer. An in-depth analysis of the impact on the local aquifer(s) needs to be done before hand. The buried drift aquifers of this area tend to have very slow re-charge and therefore can be over drawn and depleted by large quantity withdrawals, leading to permanent destruction of the aquifer.

2. An in-depth long-term analysis of the nutrient loading from manure applications and their impact on the soils and waters (ground water and surface waters) of the surrounding area.

Thousands of feet of private drain tile connect to a nearby public county drain tile (underground pipe) that drains the acres in and around the dairy operation and flows east directly to the Pomme de Terre River. Drain tiles act as a direct conduit for toxic nutrients such as nitrates.

The soils in this area are already naturally high in phosphorus. Manure spreading adds large quantities of phosphorus to the soil, often far in excess of the needs of crops. Phosphorus binds to soil particles. When soils erode due to high winds and flooding (common on cropland in this area) the phosphorus can cause severe toxic algal blooms in nearby water bodies. Attached is an example of a recent blue-green algae bloom on near-by hypereutrophic Long Lake just east of Morris, MN.

Alex Marie **Letter 159**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

My godson went to the U at Morris and we and friends still visit regularly to watch sports teams. We cannot stress enough how important an environmental impact statement is to determine just how dangerous this business would be for the surrounding community. Thank you.

Darin Broton, Minnesota AgriGrowth **Letter 160**

After reviewing the EAW for Riverview's proposed expansion at West River Dairy, the state's environmental review of the project is comprehensive and complete. While data on water use for many other large water-user projects in Minnesota are not public or unclear, the state's EAW process for feedlots includes water use. In this case, the water needed for the West River Dairy expansion will be supplied from a previously vetted and permitted source. The well that West River Dairy proposes to use as its water source was originally permitted for 452 million gallons per year. West River Dairy now proposes reducing that total water appropriation by half, to 226 million gallons per year. Additionally, West River Dairy will construct water storage basins as a contingency and climate-resiliency measure.

Riverview has a proven track record of environmental stewardship, including continuous efforts to reduce water use and the construction of innovative water-recapture basins to reduce reliance on a single water source. In addition, Riverview has been a leader in manure management plans, ensuring that not only is manure appropriately managed onsite, but also when transferred to other farms. The West River Dairy expansion will provide an organic fertilizer source for thousands of acres in the area,

reducing reliance on synthetic fertilizers and helping reduce nutrient runoff potential from farmland, and improving soil health.

Lastly, some submitted public comments have suggested the need for an Environmental Impact Statement due to the expansion's potential economic impact on local dairy farms. The purpose of an Environmental Impact Statement is to assess potential significant environmental impacts of the proposed project, not create public policy on the appropriate size of dairies in Minnesota. The legislature is best suited to determine how best to support Minnesota's dairy farmers and the overall dairy industry. Weaponizing environmental review and permitting to address broader economic policy issues is inappropriate and undermines the state's environmental regulatory process.

As a reminder, the MPCA has numerous tools at its disposal to ensure Minnesota's waters are protected, including issuing an individual permit with additional conditions rather than a general feedlot permit. We encourage the MPCA to use science and data when using those tools.

Amy Storbakken **Letter 161**

I am concerned that Confined Animal Feedlot Operations produce unhealthy products, are cruel to animals, and impact air and water quality negatively. It seems likely that they would also create biohazards, fostering conditions that spread disease. They also could amount to illegal monopolies.

I encourage all these problems to be further investigated.

Kaye Marohl **Letter 162**

We don't need another huge farm in western Minnesota. Too much extra water usage and we need to protect our wildlife. Enough is enough. So NO!!!!

Lucas Olson **Letter 163**

I am not in favor of Riverview Dairy building this expansion.

Autumn Johnson **Letter 164**

I live in Morris and I do NOT support the expansion. Not only is this getting close to a monopoly, but it will also have detrimental impacts to the local environment ans economy.

Levi Koehl **Letter 165**

My name is Levi Koehl and I am a resident of Stevens County. I currently live between two of the existing Riverview dairies, one of them being West River of the proposed expansion. I grew up here as well and have lived in the community all of my life. I farm here with my family and we have the benefit of working with Riverview, including selling crops, receiving manure for fertilizer, and we also provide custom services for the dairies. They are always good to work with, they maintain very high standards for their sites and the other operations that go along with it. The business Riverview does in the community is an economic engine that provides a lot of employment directly and indirectly. As a former employee of Riverview I can also say that they treat their employees very well.

As far as the concerns around water, I can say that within the last 3 years I have worked to develop a couple of our own new wells (residential and irrigation) in the region exactly between these existing dairies, and we have found there to be plenty of water, and of good quality as well. My family and I drink it everyday. Being a life long resident here, I have also enjoyed living near the Pomme de Terre

River. I can tell you that often, my kids go fishing there and catch many different species of fish, just as I did 20-25 years ago.

As one drives across rural America, you see the decline of many of the small towns and the main streets that are the backbone of this great country. The communities that survive and thrive are the ones where people and their families stay and do business, innovate and move forward. Stevens County is such a community, and we enjoy a lively, vibrant main street because of it.

For these reasons and many more not mentioned, I support the expansion of West River Dairy.

Scott Heinrich **Letter 166**

No to the expansion and limit herd size in a specific area

Martha Wheeler **Letter 167**

There should be a full environmental review of the proposed Riverview Expansion. Expanding the operation to 26,397 animals is a likely disaster for the land, the farmers and the local community. Huge industries should not be allowed to spoil the land, the water, and the living of local community members. Creating this expansion within 5 miles of eight protected wetland and wildlife areas needs to be thoroughly examined. Quality of life is more important than the profits of huge corporations.

Devin Nohl **Letter 168**

My name is Devin Nohl and I am a young farmer 24 years old and have been born and raised in Stevens County, just a few miles from the proposed dairy expansion. As an actual resident of this immediate area and being involved in the farming community, I have personally witnessed Riverview's commitment to supporting the local community, prioritizing employee safety, and building solid plans for environmentally sustainable operations. Their facilities have extremely clean standards and healthy animals.

As a farmer, I believe that more livestock like cows are good for the land, environment, and economy. For example, when I grow a corn crop, the corn can be used locally to feed cows instead of having to truck it to a different destination. Then, instead of having to purchase synthetic commercial fertilizer from overseas, I can use all natural dairy manure from just down the road to fertilize next years crop. On our farm we have seen significant improvements in our soil health by using dairy manure instead of synthetic commercial fertilizer. All manure from the animals is collected and stored until an appropriate time to apply it in the fall. Riverview uses some of the most advanced methods and equipment available to carefully apply this manure to farmers fields and mitigate any pollution or runoff. Many people may not realize that Riverview works hand in hand with their neighbors, big and small, to grow feed, harvest, and apply manure.

As for ground water, we have seen no concerns with water supply in this area, neither do I personally know anyone in this area that is concerned about running out of water. We are fortunate to live in a place in the world with abundant water resources and productive crop land. From what I have observed, Riverview, along with other local farmers, is committed to stewardship and sustainability of the land and these resources while providing healthy and affordable food for anyone who eats.

Angela Lund **Letter 169**

Please do not them expand! Not good for water and air pollution!

Thank you

Angela Lund

Vern Simula **Letter 170**

I urge the requirement an EIS!

For a project of the size proposed, the UNPRECEDENTED SCALED should make the necessity of an EIS an absolute requirement.

I do not object to Riverview expanding its operation, but I question the wisdom of doing it in ONE LIMITED LOCATION! Others have detailed other more specific concerns.

Emily Johnson **Letter 171**

I live in Stevens County, where the proposed Riverview Dairy expansion would be located. Given the scale of this expansion, I feel the project should undergo a full Environmental Impact Statement to ensure there is transparency around potential environmental impacts.

Tracy Otten **Letter 172**

RE: Proposed Riverview Dairy Expansion

We must require a full Environmental Impact Statement for the proposed Riverview Dairy expansion before it is allowed to move forward. I am a resident of Stevens County MN, where the expansion would be located. I am concerned about its scale as the project would more than double the size of Riverview's dairy operation in our county, with the final size being almost twice as large as the next largest livestock operation in our state in terms of animal units. A project of this unprecedented scope demands particular care in reviewing its impacts, which a full Environmental Impact Statement would provide. In addition, it is important for the EIS to consider the total projected size of Riverview's Stevens County dairy operations, including existing animal units, not just the expansion. Total size matters because the larger the total size, the larger the potential impact if something goes wrong. For example, Riverview's Feb. 2025 manure spill in Kandiyohi County likely spilled approximately the same amount of manure in 5 days that an average sized MN dairy farm would produce in 6 months, based on early reports.

Please do the report before allowing this proposal to proceed.

Kristen Ringham **Letter 173**

I vehemently oppose this project!! Huge feedlots are terrible not only for the land, but for our family farms as well. Furthermore, a quick look at their other feedlots shows they have been liable for over-pumping ground water, manure lagoon failures and various other infractions. Our clean water in Minnesota is one of our greatest resources and treasures. Are we going to squander it on a huge operation that gives little, if anything, back to our local economy and that pollute and degrades all the things we as Minnesotans hold most dear? One would hope not!! Give a resounding NO!! to this permit and project.

Caroline Collet **Letter 174**

I'm local to Morris, and regularly use the Pomme de Terre river bike paths and dog park. I'm concerned about the impact such a large operation would have on the environment that is currently an important part of my day-to-day life. I'm also very proud of the work the university does with regards to land

stewardship, and I'm not sure this is in line with the best interests of the people who live in this area and rely on this land/ecosystem.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Justin McGuire **Letter 175**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Julie Kill **Letter 176**

20,000 + cattle!

There were approximately 8,000 cattle at this dairy to begin with and they want to add up to 18,555 MORE. see FB post

"As of early 2026, Riverview LLP has applied for a permit to construct a new dairy facility in Minnesota that would hold approximately 18,855 dairy cattle, which would bring the total to 26,397 animal units

This project is notable for being the first in Minnesota to hold over 20,000 animal units in a single facility" Face book

Just the Size of this proposed operation expansion should cause serious pause and REQUIRE that a thorough investigation be completed including emergency situations, WATER USAGE, WATER ACCESS,

AQUIFER AVILABILITY, Affects on other Aquifers, individual wells, surface water quality in the whole area of Stevens county. Just the amount of water that this operation will need supplied to it ALONE SHOULD be enough to automatically require a FULL Environmental Impact Study on this Operation.

see below

If each cow drinks 30-50 gallons of water per day *26397 cows* 365 days in a year: 289,047,150 to 481,745,250 Gallons of water use just for drinking water for the cattle for a year. if it is really hot or dry outside the number can double to 60-100 Gallons. add washing water, cleaning water and possible irrigation for crops to feed all of these cattle from all over the place and this is a MAJOR ENVIRONMENTAL IMPACT possibly for the whole county.

@120-150 lbs of feces and urine PER COW/ PER DAY *26397 =3167640 to 3,959,550 pounds of waste to remove PER DAY-calculation done at 120 and 150 lbs. (source=dairyland initiative)

the proximity to the Wetlands, drainage ditches, creeks in the area as well as the topography on the area should also cause a red flag.

What has happened to water availibility in the area from the previously permitted well that is off site and that is currently being used as a water source for the dairy? Water Quality?

Do we know precisely what aquifer is being utilized for that well? Has the aquifer been thoroughly studied? (recharge rate?, aquifer size? Depth? extent?) How long can the aquifer sustain this type of usage? What will happen if there is a drought? have wells in the area been monitored for depth data or water quality? We have been having flooding also lately, what happens in a huge flood to runoff,this spring the county ditch system was overwhelmed and it took until late fall for some areas to drain off. Where will the manure and urine go if the tanks are full and they cannot get into the fields?

As citizen in Stevens county as well as a citizen in the state of Minnesota, I firmly believe that before the Minnesota Pollution Control Agency gives any permission at all for this facility they Require a FULL Environmental Impact Study. The effects on wells, sanitation, contamination and the huge number of animal units should require and EIS Study alone.

PLEASE do what is right and require a full environmental impact study.

Thank you for your time.

Jennifer Mashuga **Letter 177**

Letting this be built is a huge mistake. It is nearly twice as big as any current operations in the state. It would be using massive amounts of water: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris. The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure. We don't know the groundwater impacts. The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now. The waters nearby are already listed as sensitive or damaged. The project would likely worsen these impairments. The Riverview Dairy project must be required to get an Environmental Impact Statement.

Dori Coler **Letter 178**

This project should have extensive studies done to determine the environmental impact. Water use, run off, air quality, abatement of noise, water, air etc emissions. Traffic and road maintenance and the impact on transportation adjacent water ways with increased salt/sand and emissions from trucking.

The huge amount of water taken from the water table and the treatment necessary to prevent damage to wetlands, lakes and rivers. This significant increase in size should require all possible reviews and testing, not least of which would be a thorough, detailed and independently resourced Environmental Impact statement.

Allan LaValier **Letter 179**

I am writing to comment on the draft of the Environmental Assessment Worksheet for the proposed West River Dairy Expansion.

This Dairy, if the expansion is allowed, would be nearly double the size of the next largest operation in our state in terms of animal units.

The dairy industry is already, due to the presence of massive operations, pushing small and medium-sized farms out of business and off the land.

Though an Environmental Impact Statement is what is needed for the West River Dairy Expansion, history indicates that operators withdraw their application when asked to undergo one from the MPCA.

The sheer amount of water that would be allowed to be used from an offsite well of 226 million gallons along with the generation of 202,744,000 gallons of liquid manure and wastewater and the 26,400 tons of solid manure makes this operation's environmental impact staggering and deleterious to the adjacent community.

Barring no mapping of the Stevens County's groundwater resources or hydrological survey of the county this project must not be allowed before preparations are made as to its long term environmental impact.

Mckayla Kaardal **Letter 180**

No

Mike Odell **Letter 181**

Hello, I spend time in this area, and I am concerned with the proposed size and impact of this operation. This proposed development should get an environmental impact statement to ensure that harm isn't caused to the environment. I understand that this development would drastically increase water use, produce huge amounts of waste, potentially impact groundwater, and create an unpleasant odor. Requiring a full EIS seems very important.

Tracy Schad **Letter 182**

Requiring an Environmental Impact Statement for Riverview Dairy is essential. The proposed facility would be nearly double the size of any existing operation in the state, posing serious environmental risks.

Water demand: Riverview plans to draw up to 226 million gallons annually from an off-site well — comparable to nearly the entire water supply permitted for the City of Morris.

Waste volume: Operations would produce roughly 202.7 million gallons of liquid manure and wastewater per year, along with approximately 26,400 tons of solid waste.

Unmapped groundwater: Stevens County lacks a completed Geologic Atlas, and the required hydrologic survey hasn't started — meaning aquifer impacts from large withdrawals remain unknown.

Vulnerable waterways: The site drains into the Pomme de Terre watershed, a designated sensitive area. Both the Pomme de Terre River and a nearby creek are already classified as impaired and could face further degradation.

Issuing permits before these critical data gaps are filled is premature. The MPCA must require a full Environmental Impact Statement before this project moves forward.

Anthony Anker **Letter 183**

I am writing in strong support of the West River Dairy Expansion. Having worked alongside Riverview at several locations as a custom manure applicator, I have seen firsthand the high standards they hold themselves and their partners to — standards that consistently exceed what state regulations require.

Every Riverview site I have worked at has been clean, well-organized, and professionally managed. Their commitment to environmental stewardship is evident in every aspect of their operations, from how they handle manure application to how they engage with the surrounding community. They take seriously their responsibility to local infrastructure and invest in maintaining and improving it.

Riverview has also been a genuine benefit to local farmers. By creating reliable markets for crops and providing quality manure to improve soil health and fertility, they strengthen the agricultural community as a whole. Having pumped for both Riverview and other dairies, I can say with confidence that Riverview sets the bar for how a dairy operation should be run.

Beyond agriculture, this expansion will bring meaningful economic opportunity to rural Minnesota — a region where attracting committed, community-minded businesses is no small challenge.

Riverview has a proven track record of donating to local causes and investing in the communities where they operate.

I am proud to live and work in a community with Riverview and wholeheartedly support the expansion of West River Dairy.

Sincerely,

Anthony Anker

Audrey Gunn **Letter 184**

The very least, an Environmental Impact Statement from a party that is not invested in this project needs to be provided. It is irresponsible to other water users and residents of the area to move forward with this permit. There is already increased pressure on water systems. The threat of water contamination is guaranteed based on previous records. Concentrated animal feeding operations degrade everyone involved, including the environment. The profits are not worth the depletion and degradation. Please cease and desist.

Leslie MacKichan **Letter 185**

I have canoed on the Pomme de Terre River - while it is in a lovely setting, the water quality is already "iffy" (I was glad that we never capsized the canoe). Please ensure that a thorough environmental impact assessment is completed and interpreted before this project is authorized.

Seraphina Ridgeway **Letter 186**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Jerry Loxtercamp **Letter 187**

I'm a custom manure pumper from central mn, I've pump manure on farms all over mn,sd,nd,mi,ia,mt,in, I've toured farms all over the country. I've never seen an operation as clean and well run as a riverview dairy.

Alexander Grabowska **Letter 188**

An environmental review assessing the potential impacts of this expansion are essential. I am not in favor of the expansion regardless, but an accurate and thorough review of how this expansion will impact land, water, and wildlife across our communities is the bare minimum for helping us to understand how significant and extensive the harm will be. Any possible efforts to delay, discredit, expedite, or avoid a review will show how much Riverview values the communities it inhabits.

A business decision rooted in extracting and consolidating wealth into the hands of a few at the expense of all is not enough justification to move forward. Until the cows are compensated for the abuses they are forced to suffer (obviously incompatible with the business model), an equal amount of money and effort goes into restoring the land that has been polluted, and the millionaires that are profiting off of these abuses equitably re-distribute the excess wealth they've made to the people and communities that make their business possible, this expansion will only cause more long-term harm to the majority of people, land, nd non-human animals in our part of the state.

Mike Bieniek **Letter 189**

Please, Do Not let this happen:

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Thank you for your attention,

Mike Bieniek

Judith Flicker **Letter 190**

I am very concerned about negative impacts expansion will impose upon our already fragile environment. Stevens County has the Pomme de Terre River, various lakes, and wetlands that that provide homes to a wide variety of birds and animal life. Citizens, such as myself, enjoy the wildlife and the natural habitats they occupy. Environmental impact and conservation must be taken in to consideration before any expansion is approved.

Brent Koehl **Letter 191**

My name is Brent Koehl and I have been a lifelong resident of the Horton Township area in Stevens County. I have been actively farming for 20 years growing corn and soybeans. My farm is located approximately two miles from the current West River Dairy site and the proposed expansion. Throughout my entire farming career, I have worked directly with Riverview's West River Dairy—supplying feed and receiving manure as fertilizer. I am writing this letter to express my strong support for the proposed dairy expansion project currently under MPCA review. I believe this project will continue to benefit our local agricultural community, our land, and our water resources.

Water Quantity and Aquifer Sustainability

As a nearby well owner, water quantity is critically important to me, my family, and my operation. I have personally analyzed decades of groundwater monitoring data from the Horton DNR Test Wells that are located directly where water will be drawn to supply West River Dairy. We have compared those water level readings, done by the Minnesota DNR, against annual precipitation records from the Morris WCROC weather station. The results are clear: water levels in our local aquifer are driven overwhelmingly by natural precipitation patterns, not by agricultural water use. The data shows a statistically significant correlation between precipitation and water levels, with the strongest relationship appearing in a two-year rolling average of precipitation ($r = 0.656$, $p < 0.0001$, $R^2 = 0.43$). In practical terms, this means that roughly 43% of the variation in aquifer levels can be explained by rainfall alone—and the remaining variation is likely attributable to other natural hydrological factors. There is no evidence in the data that current water usage has negatively impacted the aquifer. Our area sits atop one of the best naturally recharging aquifers for agricultural use in the region, and the monitoring data spanning over 40 years confirms its resilience.

To put the proposed water usage in perspective: Riverview's expansion plans call for a maximum of 226 million gallons of water annually. Consider that a single square mile of land in our area receives approximately 452 million gallons of water each year from rainfall alone, based on the Morris average of 26 inches of annual precipitation. That means the dairy's entire annual water demand is roughly equivalent to the rain that falls on just half of one square mile—a modest amount relative to the scale of precipitation and recharge occurring across this landscape. Minnesota's water appropriation permitting process is rigorous, prioritizes domestic and household water use, and requires a demonstrated sustainable water source before any permit is issued. I have full confidence that water quantity can be managed responsibly as this expansion moves forward.

Please refer to Figure 1 below, which illustrates the relationship between water levels and annual precipitation at the Horton DNR Test Wells over the past four decades. The underlying data used in this analysis was sourced from publicly available NOAA precipitation records and Minnesota DNR groundwater monitoring reports.

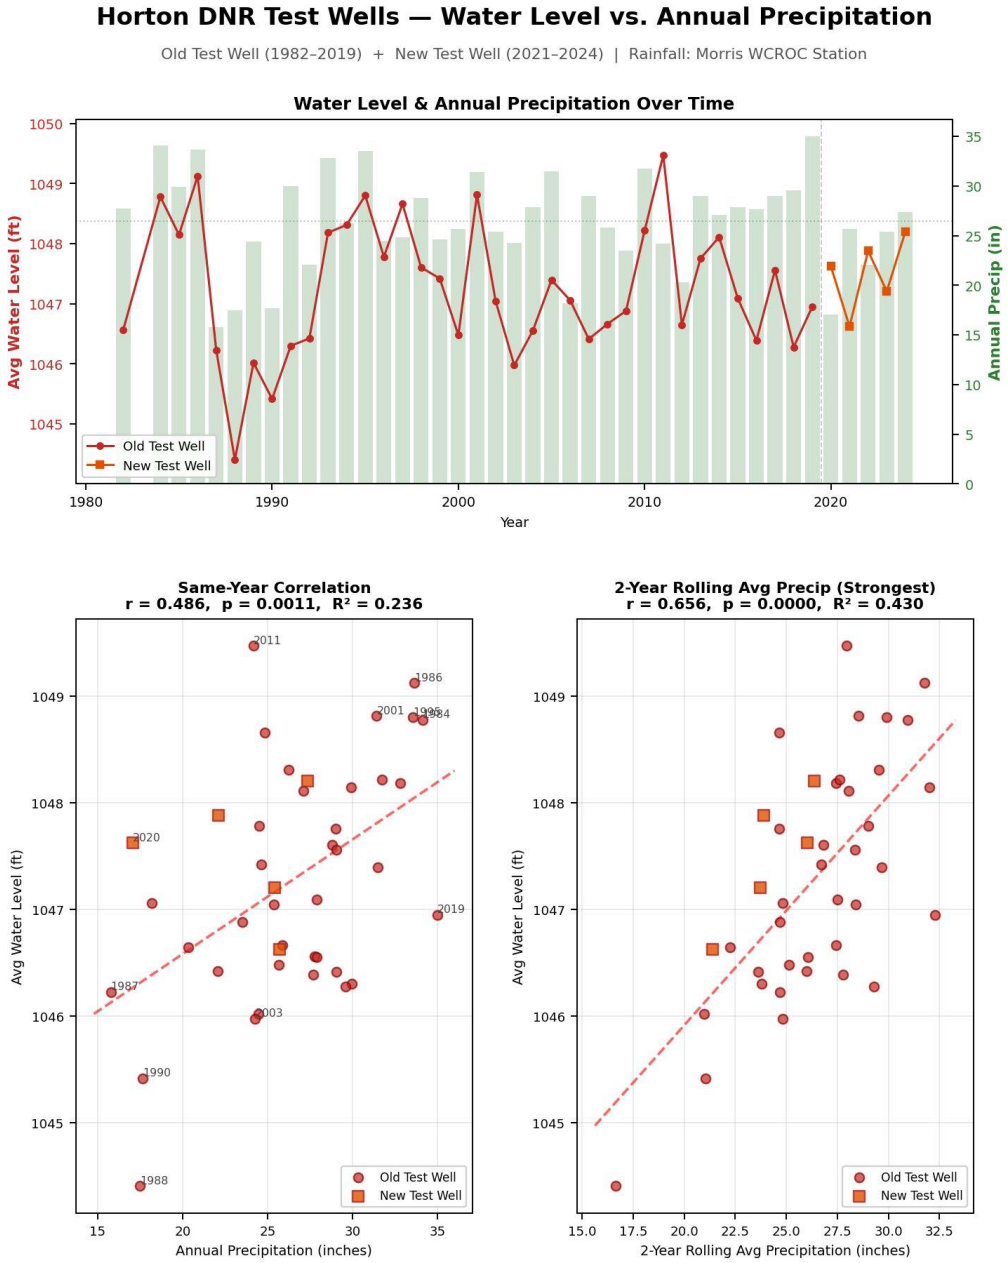

Figure 1. Horton DNR Test Wells – Water Level vs. Annual Precipitation (1982–2024)

The Agronomic Benefits of Manure

One of the most significant benefits of working with West River Dairy is the ability to sell silage and alfalfa to the operation and receive manure back in return. This exchange is not just economically efficient; it provides agronomic and environmental benefits that go beyond what commercial fertilizers alone can achieve. A 20-year study conducted by Iowa State University found that cropland fertilized

with manure had significantly better measures of soil quality—including higher particulate organic matter—compared to fields treated with commercial nitrogen at equivalent rates. Additionally, nitrate-nitrogen losses in tile drainage were 7 to 16 percent lower from manured plots than from commercially fertilized plots. Manure also increased soil organic carbon at multiple depths, increased total nitrogen, and improved the soil's ability to withstand erosion. Research at North Dakota State University's Carrington Research Extension Center found that manure applied at just 40 pounds of nitrogen per acre performed comparably to—and in some cases outperformed—80 pounds per acre of commercial nitrogen, while also producing significantly higher soil organic matter levels.

For my operation, receiving manure from West River Dairy is not just a convenience; it is a cornerstone of my soil management strategy.

Hoover, N.L., Law, J.Y., Long, L.A.M., Kanwar, R.S., & Soupir, M.L. (2019). "Long-term impact of poultry manure on crop yield, soil and water quality, and crop revenue." Journal of Environmental Management, Vol. 252. Iowa State University.

Wiederholt, R. (2008). "Manure Good for Crops, Soil." Long-term Cropping Systems Trial (est. 1987), Carrington Research Extension Center, North Dakota State University.

Organic Crop Production and the Critical Need for Local Manure

It is important to understand that the ability to grow certified organic crops in this area depends heavily on access to local manure sources. Under the USDA National Organic Program (NOP) regulations, most synthetic fertilizers are prohibited in organic crop production (7 CFR 205.105). Organic farmers must instead rely on non-synthetic nutrient sources—primarily animal manure, compost, and legume cover crops—to maintain soil fertility and meet crop nutrient demands. In practical terms, this means that without a nearby livestock operation like West River Dairy, organic producers in our area would need to source manure from distant barns and facilities. That manure would have to be trucked in over long distances, stockpiled on-site, and spread at a later time—adding significant cost, logistical complexity, fuel consumption, and road traffic. Having a local dairy that produces manure much closer to cropland eliminates these inefficiencies and makes organic production viable and economically sustainable for area farmers.

Community and Economic Impact

Beyond the agronomic and environmental merits of this project, the West River Dairy expansion would bring meaningful economic benefits to our rural community. The expansion would create jobs, bring more families and students to our towns and schools, and strengthen the local agricultural economy through increased demand for locally grown feed crops. Riverview has been an important partner to area farmers for years, and their presence supports our community in ways that extend well beyond economics. In all my years farming near this site, I have found Riverview to be a responsible neighbor and operator. They run a clean, well-maintained facility, and they take their environmental responsibilities seriously.

For all of the reasons stated above—the demonstrated sustainability of our local aquifer, the proven agronomic benefits of manure, the critical role of local manure in supporting organic crop production, and the positive economic impact on our community—we fully support the West River Dairy Expansion.

Billy Schwartz **Letter 192**

A project this size, is so very difficult to judge the impact on the natural resources. There is no way this project should be allowed because of the massive size and impact this many animals will have in that area. In MN, I feel we try very hard to keep our natural resources in high regard.

Diane Anspach **Letter 193**

As a property owner in Stevens County, my vote is "No!" This will impact our water, wildlife areas, farmers, and our community!

Katherine Johnson **Letter 194**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Joshua Truong **Letter 195**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sally Fernholz **Letter 197**

Expansion makes no sense considering the environmental consequences and future health of the environment. Rural area resources such as water and man power are finite and cannot be taken for financial gain.

Carmen Fernholz **Letter 198**

The future of rural Minnesota does not rest with corporate takeover of the dairy industry. Family farms not religious affiliated structures with lots of tax exemptions and significant amounts of capital. This corporate takeover is the quickest way to undermine our democracy as it takes away the owner/operator independence needed to maintain versatility and diverse thinking in our government. Disenfranchising family farms is the quickest way to destroy rural Minnesota and rural America.

Mary Beam **Letter 199**

I am from Benson and graduated from the UM of Morris. I am wholeheartedly against building an extension to the already excessively large West River Dairy operation in Steven's County.

Sadie Schrader **Letter 200**

Immediately DEMAND a full ENVIRONMENTAL IMPACT STATEMENT from Riverview Dairy.

Advancing any permit for Riverview Dairy without full understanding of the frighteningly DEVASTATING GROUNDWATER and WATER-QUALITY risk is unconscionable.

The Riverview Dairy controlled animal feeding operation would be nearly DOUBLE the size of the LARGEST current operation in our state. It's potential environmental DESTRUCTION is MASSIVE.

Riverview would use HUNDREDS of MILLIONS of gallons of water per year.

Riverview would dump HUNDREDS of MILLIONS of gallons of liquid manure and wastewater per year PLUS TENS of THOUSANDS of TONS of solid manure.

The DNR has NO SURVEY or completed County Geologic ATLAS for Stevens County, so aquifer and groundwater resources are UNKNOWN.

Nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already COMPROMISED and listed as IMPAIRED.

REQUIRE a full ENVIRONMENTAL IMPACT STATEMENT from Riverview Dairy immediately.

Lexi Fischer **Letter 201**

No to expansion. Protect our land and smaller farmers against big corporations.

Julie Knopp **Letter 202**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Angelica Agents **Letter 203**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Anna Overby **Letter 204**

Please make Riverside Dairy farm submit to an environmental impact study. Factory farming is shown to increase use of water, runoff & other harmful chemicals in the water stream. It is vital we measure this be for building

Brinna Langford **Letter 205**

Hi, the Pomme de Terre River runs through my property, I have 3 acres on one side, 7 on the other. The river is already quite contaminated come early summer, I fear this would make it much worse. I want my kids and I to be able to swim in it all summer! PLEASE PLEASE PLEASE do an environmental review, at a minimum, before considering allowing another huge farm.

Thank you!

Lisa Koehler **Letter 206**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Thank you.

Brenna Munoz **Letter 207**

vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/ year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of l quid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Victoria Piotter **Letter 208**

Please do not allow this dairy center to be built in the purposed location. It is irresponsible and could lead to catastrophic environmental damages for generations. Please let us clean up our precious waters!

I reside in Winona MN but this issue takes place in my home town area. I remember playing in streams on the farm as a child. Making sure our waters are safe for our children and wildlife should take priority!

Alexandria Muff **Letter 209**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Julia Cedergren **Letter 210**

Riverview Dairy must submit an environmental impact statement! Stop trying to ruin our beautiful planet!!!

Mitch Trumble **Letter 211**

Good morning,

My name is Mitch Trumble. I am writing to you in regards the the West River Dairy expansion project proposed for Stevens county where I live.

I have no financial investment in Riverview dairy and perhaps that is to my loss, however I do have a concern that this company is doing irreparable harm to the small farms and future farms of our area. The cost of land has been driven up incredibly high and the pockets of Riverview are very deep, no small farm can compete when it comes to land and rent prices and this is not improving. If the surrounding farms do not sell crops to the dairy for feed and in turn, BUY back liquid manure they are on the loosing

end of farming next to a corporate farm that will simply out bid them on land and rent until they have it for them selves.

I am not accusing the company of malicious intent, I believe that to them "its just good business". My children will never be able to farm in the future due to the inflated costs, particularly of land in our home area, due to the Spring Valley/Riverview competition.

The second concern I have is the smell, I do not live close enough to the West River Dairy for that to be a personal issue but I am about 2 miles from the original Riverview Dairy and the smell is very noticeable. During fall when liquid manure is being applied the county stinks as a whole, the well water smells of rotten eggs and this has not been getting better.

I feel the monopoly of Riverview is hurting small family farms if they do not want to participate in the game with Riverview and sell them commodities to stay on good terms. Large corporations like Riverview are doing a disservice to the farming community in my opinion. We have enough dairy products in Stevens county, I don't see how adding 11,000 more mouths will help the small guy out. I did not post comments on the public sight as I feel a target would be on my back and most small farmers I have spoken with have the same reservations about publicly questioning this expansion.

Thank you

Crystal Poppe **Letter 212**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons a year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons per year per 5000 plus residents).

Huge waste output: the facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: the DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: the expansion sits in the Pomme de Terre Watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek - are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water quality risks is irresponsible. It is critical that the MPCA require a full environmental risk impact statement.

Erin Jimcosky **Letter 223**

Minnesota doesn't need more environmental destruction. Require an environmental impact study or just don't approve of it. If we don't protect our state, we will lose what makes it great.

Marjie Carr-Oxley **Letter 224**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons a year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons per year per 5000 plus residents).

Huge waste output: the facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: the DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: the expansion sits in the Pomme de Terre Watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek - are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water quality risks is irresponsible. It is critical that the MPCA require a full environmental risk impact statement.

Paul Carlson **Letter 225**

As Superintendent of Hancock Public School, I am pleased to express my support for the West River Dairy Expansion. Our district's success is connected to the strength and stability of the area we serve, and this project represents a meaningful investment in both. The expansion of West River Dairy will bring valuable economic growth to our region, supporting local families and strengthening the tax base that helps sustain high quality educational opportunities for our students.

Agriculture has been a cornerstone of our community's identity, and continued investment in this sector ensures that our students can look forward to a future with robust career pathways close to home. Beyond the economic benefits, Riverview has consistently demonstrated a commitment to being a responsible community partner. Their support for youth programs, hands on learning experiences, and agricultural education has enriched our schools and helped students develop real world skills. The expansion will only deepen these opportunities. I look forward to the positive impact this will have on our students, families, and the broader area.

Marjie Carr-Oxley **Letter 226**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here is what we know now.

Massive water use: Riverview would pump up to 226 million gallons a year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons per year per 5000 plus residents).

Huge waste output: the facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: the DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: the expansion sits in the Pomme de Terre Watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek - are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water quality risks is irresponsible. It is critical that the MPCA require a full environmental risk impact statement.

Sloan Parker **Letter 227**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well. Nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Reid Gosmire **Letter 228**

Please please please require a full environmental impact statement!

Kaitlyn OConnor **Letter 229**

Please require Riverview Dairy to conduct a full environmental impact statement

Nicola Philpott **Letter 230**

The Riverview Dairy project must be required to get an Environmental Impact Statement. Its environmental harm would be enormous.

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure andwastewater annually, plus 26,400 tons of solid manure.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for5,000+ residents).

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Marjie Carr-Oxley **Letter 231**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state. and its environmental harm would be enormous. Here's what we know now.

--Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well--nearly as much as the entire City of Morris (permitted for 300 million qallons/year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

--Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Xander Godfrey-Singh **Letter 233**

The amount of ground water waste, water usage, and other polluting factors is a poor use for this land. Please reconsider this.

Ryan Meehan **Letter 234**

I'm concerned about this project and how it interacts with surface and ground water in our state.

Ed Brands **Letter 235**

Two quick points:

1) Where is the water coming from for this expansion? From the spotty aquifer beneath the existing dairy? From a "retired" water use permit from the ethanol plant in Morris? The ethanol plant still uses water from the same aquifer, but it gets the water from the city instead of directly from the wells it used. The Pomme de Terre aquifer in Morris is also the city's drinking water source. It is not clear that this aquifer can support a giant dairy operation in addition to the existing demands.

2) A roughly 20,000 cow dairy will require approximately 30 square miles of land to feed the dairy animals and to absorb their manure. Combined with the other two large dairy sites operated by Riverview in Stevens County, Riverview's operations will occupy more than 10% of the land in the county.

Karen Arnold **Letter 236**

Please review the impacts of this expansion carefully. Water is a precious commodity.

Kevin Koehl **Letter 237**

To: Minnesota Pollution Control Agency (MPCA)

Subject: Support for West River Dairy Expansion in Stevens County

Dear MPCA Review Team,

My name is Kevin Koehl, and I am writing to express my support for the proposed Riverview Dairy expansion in Stevens County. Projects like this represent an important opportunity for rural communities in western Minnesota to strengthen their agricultural economy while supporting responsible production practices.

First, the expansion would contribute positively to local job growth. Dairy operations of this scale require a wide range of skilled and semi-skilled employees, including positions in herd management, animal care, equipment operation, maintenance, and transportation. These jobs provide stable employment opportunities in rural areas where maintaining a strong workforce is critical to long-term economic stability.

In addition to on-farm employment, dairy expansion supports value-added agricultural processing in our region. Riverview is constructing the Stevens Milk Plant near Morris, a facility that will process approximately four million pounds of milk each day and produce products such as non-fat dry milk and skim milk powder. This plant alone is expected to employ dozens of people and represents a significant investment in Stevens County’s agricultural infrastructure. Facilities like this keep more of the value of agricultural production in our region while creating skilled manufacturing jobs tied directly to Minnesota agriculture. The West River Dairy Expansion will compliment this plant as well.

The project also supports the broader production agriculture system that is central to Stevens County. Dairy operations create strong demand for locally produced feed crops such as corn silage, alfalfa, and small grains. This demand provides reliable market opportunities for area farmers and encourages diversified crop rotations. When livestock and cropping operations work together, they strengthen the overall resilience and profitability of the local agricultural economy.

Another important benefit is the value of dairy manure as a nutrient resource. When properly managed, manure serves as an e□ective organic fertilizer that improves soil fertility and supports crop production. When applied under nutrient management plans, manure returns nitrogen, phosphorus, potassium, and organic matter back to the soil. This helps reduce reliance on commercial fertilizers while improving soil health and productivity for local farmers.

Agricultural investments of this scale also strengthen the local tax base and rural infrastructure. Economic activity generated by expanded agricultural operations contributes to counties, townships, and school districts. The addition of employees and their families support local schools, housing demand, and small businesses. Maintaining strong school enrollment and vibrant rural communities depends on continued economic activity, and agriculture remains a foundational driver of that activity in Stevens County.

I appreciate the MPCA's role in ensuring that agricultural development occurs in a responsible and environmentally sound manner. With appropriate oversight and modern management practices, I believe the West River Dairy expansion can provide meaningful economic and agricultural benefits to Stevens County while meeting environmental standards.

Thank you for considering this perspective during your review process.

Sincerely,

Kevin Koehl

Melissa Harper-France **Letter 238**

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sarah Hernández **Letter 239**

There needs to be a thorough review of the long term impacts.

Jolene Turner **Letter 240**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Alicia Sandor **Letter 247**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 26 million gallons/year from an off-site well-early as much as the entire City of Morris permitted for 300 million gallons/year for 5,000+ esidents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped -making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Pixie Green **Letter 248**

West River dairy must be required to provide an environmental impact statement! The expansion of factory farming in Minnesota will have devastating consequences on our lakes and our ground water, endangering people for generations to come. You must move to protect the people of Minnesota rather than the interests of big dairy.

Grace Davies **Letter249**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well —nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Carter Voorde **Letter 250**

As someone who lives in Stevens County and will be affected by this project, I insist MPCA require a full Environmental Impact Statement before the project can go forward. This is a hugely transformative proposal that would double Riverview's operations in our county, which is not something to take lightly. It is the least that can be done to do a FULL Environmental Impact Statement in order to fully understand the impacts of this change.

A project of this unprecedented scope demands particular care in reviewing its impacts, which a full Environmental Impact Statement would provide. In addition, I believe it is important for the EIS to take into account the total projected size of Riverview's Stevens County dairy operations, including existing animal units, not just the size of the expansion. Total size matters because the larger the total size, the larger the potential impact if something goes wrong. For example, Riverview's Feb. 2025 manure spill in Kandiyohi County likely spilled approximately the same amount of manure in 5 days that an average sized MN dairy farm would produce in 6 months, based on early reports.

Hayley Saccoman **Letter 251**

We don't want more pollution from a giant factory farm in MN. This is not the direction we need to go. Our environment is at a terribly perilous point in time and we need to prioritize the health of everyone before this giant farm that abuses animals as a business. Hard no from me as a small business owner.

Shanta Mayweather **Letter 252**

We the people of Minnesota do not want factories replacing farms. We don't want our food grown inside buildings, and labs. Listen to the people, the consumers, the indigenous communities, and most importantly nature. Please allow the planet to provide we don't need human intervention anymore.

Kathy Burt **Letter 253**

This project should require an environmental impact statement. The size of this operation will have a negative effect on the surrounding area and beyond. Bigger is not better when resources will be gobbled up. This operation should not go forward.

Bonnie Morgan Norgren **Letter 254**

I COMPLETELY OPPOSE this request for expansion!! The environmental impact will be negatively huge and detrimental to many valuable lakes and connecting rivers in both Stevens and Grant counties. Approving this expansion would be actionable for a Class Action lawsuit. Please, please DENY this request and protect our valuable lakes and rivers. Protect our ground water! This is exactly the opposite direction for The land of 10,000 Lakes. DENY THIS REQUEST!!

Pamela Gades **Letter 255**

Do the EIS study. Go forward with that. Once you have all of the results from the study, then make a decision.

Shanta Mayweather **Letter 256**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well —nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Anne Moreno **Letter 257**

Please don't allow this project to move forward without an environmental impact review.

Thank you,

Anne

Debra Luetmer **Letter 258**

Our water resources are too valuable not at ensure that they will be used wisely. A full, comprehensive review needs to be completed.

Tawnya Gelle **Letter 259**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Tierney Graf **Letter 260**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous.

Massive water use:

Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output:

The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts:

The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

Sensitive, already-impaired waters:

The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired.

The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ann Williams **Letter 261**

Please do not allow this expansion. The huge amounts of water required is not sustainable in today's world.

Jenifer Culbertson **Letter 262**

I have family and friends in Morris and this would impact their enjoyment of their homes. Concerns about water shortages, increased manure (smell and pollution) are concerning . It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters:

The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are alread listed as impaired.

Tanna Rens **Letter 263**

I could not caution you more to not allow this. These large scale dairy farms are ruining our rural farming community. They (unfortunately) put one up close to our home and it has essentially ruined our once peaceful farm. We can rarely have our windows open due to the horrible smell when they're separating manure. The amount of flies that we have is absolutely disgusting and we can't even enjoy being outdoors. They are pushing every small dairy farm out of business. When is enough enough for them?

Wendy Pilot **Letter 264**

Riverview Dairy must be required to complete a full environmental impact statement. This facility would be nearly twice the size of any other dairy operation in Minnesota, and the potential damage to our environment is too serious to ignore. Here is what we already know. Water use: Riverview plans to pump up to 226 million gallons of water per year from an off-site well. To put that in perspective, the entire City of Morris with over 5,000 residents is permitted to use 300 million gallons per year. Waste production: The facility would produce roughly 202.7 million gallons of liquid manure and wastewater every year, along with 26,400 tons of solid manure. Groundwater risks: The DNR has not yet completed a hydrologic survey or the County Geologic Atlas for Stevens County, meaning we do not have a clear picture of local aquifers and groundwater. Approving large water withdrawals before that work is done is a serious gamble. Already-struggling waterways: This project sits within the Pomme de Terre watershed, which is already designated as sensitive. Both the Pomme de Terre River and a nearby unnamed creek are currently listed as impaired. Adding this facility would likely make things worse. Moving forward with permits before we fully understand the risks to groundwater and water quality is reckless. The MPCA must require a complete Environmental Impact Statement before this project goes any further. Sincerely, Wendy P

Michael Finn **Letter 265**

An expansion of this magnitude proximity must justify the completion of an environmental assessment. Minnesota's land, water, and wildlife are one of our greatest assets and worth protecting against the potential risks of storage and distribution of manure, runoff, and other contaminants. Thank you for your attention to this matter

Claire Kaiserman **Letter 266**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Dominic Decker **Letter 267**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Rachel Coler Mulholland **Letter 268**

I am deeply concerned to learn that MPCA is even considering granting a permit to Riverview Dairy for their planned expansion without an EIS. A dairy of this proposed scale does not yet exist in Minnesota, much less nested amongst so many protected wildlife areas and near such a vital watershed. Given Riverview's recent history of manure spills in Minnesota, along with the damage they've caused in other municipalities with over-pumping and water table depletion, it behooves the MPCA to require a full environmental review of any proposed expansion that INCLUDES the existing dairy in the equation (not just the expansion). Please consider the health of the land, the flora and fauna, and the PEOPLE who live in this area - myself and my children included. Thank you for your time.

Alexandra Beane **Letter 269**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kelsey Hambor **Letter 270**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Meghan Manahan **Letter 271**

I am writing to request that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous, including massive water use, huge waste output, unknown groundwater impacts, and potential harm to the Pomme de Terre watershed, designated as sensitive.

Melody Kitchen **Letter 272**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/ year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

What

Janice Kostad **Letter 273**

Please review this project and protect our natural resources. Please also review and consider the consequences to our local economy if we allow such a large facility.

Karrie Vrabel **Letter 274**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Winnie Cheung **Letter 275**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/ year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kayla Jacobson **Letter 276**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous.

Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Lia Saaskilahti **Letter 277**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now. —Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/ year for 5,000+ residents). -Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure. —Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now. —Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Rodden Turner **Letter 278**

An EAW must be done to assess environmental impact. Please don't sell out MN residents because of mislaid policies, this is unnecessary expansion. Additionally, factory farming on this scale is immoral.

Sheila Nelson **Letter 279**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Emily Rosenmeier **Letter 280**

This is a terrible plan, and absolutely must include an EIS, as well as some study of the impact it would have on the surrounding communities. Small dairy farms MN are already struggling, and this proposal would put many of them out of business and create an unwanted monopoly on milk production, as well as create a potential environmental danger.

Jodi Gruhn **Letter 281**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

John Sheehan **Letter 282**

When is it going to end? If the pollution control agency doesn't think it's a good idea why allow it? Shouldn't this require a more extensive review than an EAW? I have invested millions in RE projects and an EAW is not a big deal and this project is huge. I would think the ground water pollution would be unbelievable and the use of all of that water from an "offsite well"? What the does that mean? Where is the well, what aquifer will it draw from and who will that effect? I'm tired of this crap. Projects like this will have a negative effect on my grandchildrens future and further destroy the family farm. That takes the competetivness out of business. Food companies are already screwing us.

Heather Waye **Letter 383**

I understand that Riverview has applied for an expansion that would result in an operation double the size of the next largest livestock operation in Minnesota (in terms of number of animals). The proposed site in Stevens County, where I live, will be very close to more than a few protected waterfowl and wildlife production areas. Riverview has a history of manure spills in our area and inappropriate use of water resources in Arizona. This proposed project will have a major impact throughout our county, the Pomme de Terre watershed, and communities and habitats downstream. Therefore, this proposed project must be required to undergo a full and thorough Environmental Impact Statement.

Anna Borell **Letter 284**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kurtis Koehl **Letter 285**

I am writing in support of the West River Dairy Expansion. Having lived in Stevens County for all of my 40 years, I have had the opportunity to work for and with Riverview. I live and farm in between two of the Stevens County dairies, and our farm is able to source manure from these dairies for organic crop production. Having Riverview in my backyard has given myself and my kids opportunities that would likely have otherwise not existed. We are able to be involved in forage harvesting and manure application, both of which allow us to better utilize our equipment for our farm.

For those of us that live here, water use and water quality are of utmost importance. I have confidence in Minnesota's water appropriation and permitting process along with MPCA requirements, that water use and water quality can be managed effectively as this project moves forward. Living less than two miles from one of the dairies, I have seen no negative impacts on my water quality.

Living in rural MN, I expect slight inconveniences at times as farmers go about providing food for all of us, and Riverview's attention to this is impeccable. Riverview does a phenomenal job of maintaining roads, dust control, and reducing odor during field operations.

I believe this project will benefit the area for years to come, that is why I support it.

Thank you.

Kurtis Koehl

Steph Kuehn **Letter 286**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Cari Lombardi **Letter 287**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Mark Berkson **Letter 288**

Greetings,

I am writing because I am deeply concerned that another CAFO (factory farm) is going to be created in Minnesota. This is the last thing we need, not only because of the devastating environmental impact these facilities have, but also because of the documented mistreatment of animals. Above all else, an environmental impact report must be submitted and audited by an independent organization of experts. The industry itself cannot be trusted.

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Thank you,

Mark

Amy Kinneman **Letter 289**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

-Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

-Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Linda Hanke **Letter 290**

Please do not approve this EAW! This will negatively affect the environment in the surrounding areas. And the amount of water needed would be horrific. This must not get approved. Thank you.

Mark Kaelke **Letter 291**

Riverview LLP's proposed expansion of operations at the West River Dairy should receive the highest level of review possible, by both MPCA and DNR, to assure their activities will not negatively impact the quality or quantity of nearby surface waters, acquifers, wildlife, vegetation, soils, and people. Permits for this expansion should not be issued unless negative impacts to these resources can be avoided and Riverview should be required to monetarily insure against spills and other accidents which may occur as a result of their operations.

Lisa A **Letter 292**

Please call for an environmental impact study. As an agency that is called to control pollution, you must take this seriously and do what is required of you. Lives are at stake. Water pollution is at risk so is methane pollution. Factory farming is often cruel besides. Do your jobs please and consider the pros and cons in terms of who benefits and who suffers from rushing this through. How will this affect Minnesotans quality of life? How will it harm us? How will it affect the environment? How will it benefit? How will it harm? Think 7 generations. Be smart, have a heart

Amanda Huggett **Letter 293**

As an animal lover in Minnesota, PLEASE, do not add a massive factory farming operation to be added here or anywhere. It is bad for the environment, it is bad for animals, and it is bad for people. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Roxanne Friedenfels **Letter 294**

No to the West Dairy River expansion. It will be environmentally harmful.

Lori Clark **Letter 295**

Farming operations like this are simply TOO BIG! Too big for the land, too big for the neighbors, too big for the water infrastructure, and WAY TOO BIG to not require a EIS.

PLEASE care for the citizens and the environment before the corporations and pause long enough to address the issues an EIS covers. Thank you for always protecting our environment FIRST.

Thomas Hoch **Letter 296**

This project expansion is an environmental disaster in the making. What we SHOULD be focused on is how to transition dairy away from operations such as these to one that more appropriately uses agriculture. Plant-based products could not only protect our environment but would eliminate the extreme animal cruelty inherent in these operations. Just take a look at their website: https://riverviewllp.com/ . Animals placed on a merry-go-round for their entire adult lives? Really? And the public is left to pick up the pieces from these disastrous CAFOs.

Candace Marx **Letter 297**

How will they dispose of the manure? what about Pollution from this facility (chemicals in the manure, water polution, The amount of water they will need (effect on ground water, etc,), Air pollution, Smell, how will they dispose of dead cows & calves? There are so many factors to consider - we need an enviormental Study before any construction. Please checkdo this first!

Loren Stoner **Letter 298**

I am writing as a concerned citizen and health care provider. CAFOs are resource-heavy, produce less-than-healthy animals, and contribute to significant pollution in the United States. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below-cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing it to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies.

The Pomme de Terre watershed, where this expansion is proposed, is considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

It is absolutely reasonable to do a full environmental impact study regarding this proposal. Thank you for your consideration.

Elizabeth Brandt **Letter 299**

There is no way this action benefits small dairy farmers, is a positive environment for the animals and is healthy for the environment.

This must not be allowed to continue.

The smell alone would be unbearable.

Shelly Bell **Letter 300**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Leland Stoe **Letter 301**

I am a fly fisherman and outdoorsman. I was on Rush Creek near Lewiston with my 6-yr-old grandson and my son three weeks before the massive 2021 fish kill, where approximately 2,500 trout were killed over a one-mile section just upstream from where we had our magical outing. On that day, my grandson presented a #18 dry fly to the fish by himself and fooled his very first trout. He netted the fish himself while broadly smiling with pride.

The fish kill resulted from a combination of 1) low stream level in late summer 2) large rainfall 3) poor farming practices. There was (and is) a CAFO of about 1,500 cows near the headwaters of Rush Creek in Winona County. Basically, storm runoff transports these toxins into the water at higher concentrations when stream flows are lower (especially as summer progresses) and therefore provide less dilution of the toxins. And large storms are increasingly becoming the norm.

The Driftless Area in SE MN (in places like Lewiston, where Rush Creek is) has a "Swiss cheese" geology, which is why we have cold water spring creeks in the area. Water from the surface can reach the aquifer in 0-3 days.

We learned this the hard way with the 2021 Rush Creek fish kill.

The Central Sands area (like the Willmar area) is also has a very sensitive geology, where surface water can quickly reach aquifers. We cannot afford to find out the hard way with this massive CAFO proposal permitting 18,855 dairy cattle on a single site. Being over ten times the size of the CAFO near the headwaters of Rush Creek, the environmental risks are clear.

We cannot, in good conscience, approve a CAFO of 18,855 dairy cattle before performing an Environmental Impact Statement (EIS).

If the analysis shows that a CAFO of this size would be safe, so be it. But moving forward without and EIS is risking the environment and human health. We must require an EIS for a proposal of this magnitude.

Douglas Nopar **Letter 302**

I am concerned about air quality , and its effects on workers and neighbors, both the gases from storage facilities, and the air quality effects from the spreading of liquid manure. Of equal concern is water quality , and the effects of liquid manure and excess nitrogen fertilizer application on nitrogen levels in groundwater (as well as phosphorus impacts on surface waters).

An environmental impact statement needs to be done to not only examine air and water quality, but to also assess the impacts of this proposed facility on the economic viability of small and mid-size dairies in the entire state. Lastly, Riverview's track record of exploiting its immigrant work force must also be reviewed for cases of wage theft, failure to provide worker's compensation benefits to farm workers, and failure to pay overtime wages. Operations such as this proposed operation are a blight on

Minnesotas farm and rural economy . We need the state of Minnesota to protect us from these facilities, and not allow them.

Birgitta Anderson **Letter 303**

I believe that a more in depth study into the environmental impact of a production of this size. This is new territory for MN and its citizens deserve the time and attention to their communities that an in depth study provides.

Em Perttu **Letter 304**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/ year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

-Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped — making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Abby A **Letter 305**

Riverview Dairy should be required to submit an environmental impact report!!

Thank you!!

Steve Thompson **Letter 306**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Dean E. Peterson **Letter 307**

Dear Mr Peterson:

The following are my comments that I would like posted for the EAW being conducted for the West River Dairy expansion in Stevens County.

I am not an environmentalist nor do I understand the entire process. I am not an owner/shareholder of Riverview. I just wanted to expound on the people and the organization behind Riverview Dairy LLP. I desire that the public knows and understands the integrity of the people behind this project. I feel there are several misconceptions about who Riverview is and what they stand for.

I have now known four generations of the founding family of Riverview. I lived in the Morris area from 1986 to 1998. This family was one of my customers in the business that I worked for. I spent many hours working in and around their farms south of Morris.

I have never worked for nicer people. I know they would never invest in something that could be of harm to their adjoining neighbors. They consider their neighbors their partners. Their desire is to add value to their surrounding communities. I appreciate all the kids that have been added to our schools because of the new employment at Riverview.

I want to share what their Core Values are that are posted in all their work places:

Strong Work Ethic	Proverbs 6:6-8
Integrity	Luke 12:2
Keep it Simple	Matthew 22:37-40
Candor	1 Thessalonians 5:14
Spirit of Humility	James 4:6

The consolidation and growth of any business is an issue today in all areas of our country's commerce. It doesn't matter what industry your involved with, consolidation is what it takes to survive and be competitive. Sadly the days of small family farms with a hundred dairy cows are over.

I would encourage anyone to visit any of the Riverview milking facilities. You will notice there is no smell and you cannot find a cleaner operation. These guys know how to manage their facilities!

I appreciate and respect the process to get these permits and I thank you for the opportunity to comment here.

Sincerely,

Dean E. Peterson

Janet Thompson **Letter 308**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Celeste Knoff **Letter 309**

Minnesota Pollution Control Agency,

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

I care deeply about the environmental impact of this CAFO. I care deeply about keeping Minnesota and its water clean and sustainable for future generations.

Thank you.

Celeste Knoff RN, MAN, MBA, CNE

Jeffrey Borchert **Letter 310**

Hello. I feel NO person or company should have this many animals, for many reasons. Impact of land around it. Animal safety due to equipment failure or help issues. I own land near the project both north (Alberta) and to the south (south of Oliver lake), not close but very possible having an impact. There are many USFWS properties nearby as well. This does nothing to help locals either. They have a track record of manure spills. I really believe a project of this size needs EIS study done. I actually believe they may have too many cows already. Jeff Borchert.

Austin Voltin **Letter 311**

We don't want of need this!

Faye Duvall **Letter 312**

Please consider the soil and your neighbors. This large number of animals in one location is not healthy for the environment.

Marz Beckman **Letter 313**

No project of significant size such as this should be allowed in a community without an environmental impact study. We can destroy the environment easily but we can't restore it without a great deal of money. Do the right thing.

Kim Fortin **Letter 314**

It is essential that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now:

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Todd & Cheryl Jackson **Letter 315**

When is enough enough ??? There is already an abundance of dairy cows cattle in this area of MN. This will be one more nail in the coffin for the small dairy producer.

Audrey Kingstrom **Letter 316**

I can't imagine that such a large operation is good for the environment or the surrounding rural neighborhood. You must at least do an environmental review. While I don't live in that area (I live in the

city now), I grew up in west central Minnesota and my brother now operates an industrial hog operation on what used to be our family farm. Not only is it cruel to the animals to be confined as they are, but the manure lagoons reek and make living in the area so unpleasant. Plus the manure concentration on the fields and the inevitable contamination of waterways are a travesty to the environment.

I urge you to take a closer look at this proposal for the West River Dairy Expansion -- and deny the request. We need to move to more sustainable and regenerative agriculture in this state -- and stop these huge livestock operations!

Karen Ahrens **Letter 317**

I am terrified by the Riverview proposal. Living nearby the Daley Farms in the karst topography of southeast Minnesota, I feel the anxiety of these neighboring communities. These monstrous CAFOs demonstrate selfish disregard for the health, safety and economic conditions of everyone, even their own families. These industrial farms will leave a "legacy" of greed, toxic well water,deserted towns and human suffering.

This is beyond opinion. They are undisputable facts.

Kim Hiltner **Letter 318**

I am writing to express my concerns with Riverview, LLP's proposal to build the first livestock operation in Minnesota to hold over 20,000 animal units. The MPCA must recognize the fundamentally new nature of this threat. This proposal must be required to undergo a full Environmental Impact Statement (EIS) on its impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. Minnesota is is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Agricultural consolidation is pushing small and medium-sized family farms out of business and off the land. We must require an EIS before this proceeds.

Emily Marsolek **Letter 319**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Allie Arthur **Letter 320**

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Mary Vlazny **Letter 321**

An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. This is what the MPCA is for, to assess the potential for harmful impacts to our local environments, both ecological and social. According to the documents filed by Riverview, the proposed operation would require:

To supply water for the operation, the facility will be allowed to pump 226 million gallons from an off-site well per year. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year.

Liquid manure storage encompassing 250 million gallons of waste.

13,200 acres of farmland for manure application.

Riverview has a recent history of a manure spill in western Minnesota. In Arizona, the company recently agreed to pay $11 million to residents affected by the dairy's over-pumping.

The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

Just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. I have watched this happen in my own county here in Minnesota and the local push-back necessary to prevent the exploitation of resources. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

Robert Rinkenberger **Letter 322**

To Charles Peterson and the Minnesota Pollution Control Agency,

Hi my name is Robert Rinkenberger, I have lived in Stevens County for 67 years. I live 3 miles as the crow files from West River Dairy. You wouldn't even know the facility is there except for a little more traffic during harvest. I have been on the Township Board as supervisor since 1996. We have not had any

major problems with the roads with the extra traffic during harvest. And what does pop up Riverview is easy to talk to and will take care of any issues that arise immediately.

Riverview does an excellent job of odor control, manure management and keeps the site very clean. It gave me the opportunity to diversify crops, that I didn't have the ability to have done before they started West River. I have read some of the other comments and it seems like some people did not read the EAW for this project because their statements don't line up with what's on file. For one Riverview has been great neighbors to work with, although they do buy land, like everybody else, they also help smaller guys expand their land base. As far as the use of water, I believe the MPCA and the DNR have done their due diligence in protecting the water resources and quality. It also gave myself, my children and grandchildren the opportunity for supplemental income, such as hay, silage and straw hauling. Riverview also does many community projects and provide educational opportunities for many young people in our area, where they can learn all aspects of the business which is many. I am only a neighbor not an investor and I have no monetary value in the dairy other than I get the opportunity to work for them time to time. I completely support the expansion of West River Dairy. Thank you for your consideration and I hope they will get the permits needed.

Thomas Sybrant **Letter 323**

This project is too large for the area. The pollution impact has not been studied and presented. This is about greed, not the health of the animals or community. Thank you.

Malee Johnson **Letter 324**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, i, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permi ts without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Gretchen Goodman **Letter 325**

Surely an expansion of this size and scope warrants an Environmental Impact Study! The people of Stevens county, and indeed of all Minnesota, deserve this. Our environment, and its ability to sustain itself, needs more than just rubber-stamp approvals.

Gretchen H Goodman

Danielle White **Letter 326**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sumi Srinivasan **Letter 327**

It is vital that the Riverview Dairv be required to submit an environmental impact statement. It is nearlv twice as big as anv current operations in the state, and its environmental harm would be enormous. Here's what we know now

-Massive water use: Riverview would pump up to 226 million gallons/vear from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/vear for 5,000+ residents)

-Huqe waste output: The facilitv would generate about 202.7 million gallons of liquid manure anc wastewater annually, plus 26,400 tons of solid manure.

-Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped -making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are alreadv listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Holly Swiglo **Letter 328**

I urge you to oppose the expansion of West River Dairy, due to the large environmental impacts and health impacts on local communities.

Ann Peckskamp **Letter329**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Maurice Spangler **Letter 330**

This huge expansion of factory dairy farming poses risks for environmental pollution, massive amounts of water and financial risks for smaller dairy farmers. Please do an Environmental Impact Statement and give a very careful, thoughtful assessment of this project.

Taylor Borgman **Letter 331**

This huge expansion of factory dairy farming poses risks for environmental pollution, massive amounts of water and financial risks for smaller dairy farmers. Please do an Environmental Impact Statement and give a very careful, thoughtful assessment of this project.

Jazmin Goire **Letter 332**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Deborah Liang **Letter 333**

Riverview Dairy must be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Current concerns:

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ana Shickich **Letter 334**

After learning about this proposal, I believe it is essential that Riverview Dairy be required to submit an environmental impact report. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Current concerns:

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Report.

Michael Kennedy **Letter 335**

This project, due to its unique size and impact, requires a mandatory EIS. Anything less would be setting a precedent in our state that threatens all future land use for dairy operations by ignoring massive impacts on already fragile natural resources.

Jennifer Love **Letter 336**

Farming cows is a huge contributor to global warming and environmental damage. Please do not expand, even with the most up to date farming practices, this is not good for our climate as a whole nor for the protected and already struggling Pomme de Terre watershed.

Cassie Dudley **Letter 337**

Riverview Dairy must be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Current concerns:

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Brook Pederson **Letter 338**

As a homeowner who can't drink their well water due to the high nitrate concentration in it. It is absolutely abhorrent to see and hear such a violation of nature being proposed. I've never understood why humans are so hell-bent on creating food in such a terrible way. This is a horrific idea. It's terrible for humans. It's terrible for animals and it's only good for a few Farmers Pocketbooks!

Kirstan Ketter **Letter339**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Emily B **Letter 340**

Aside from environmental concerns wich are innumerable, factory farming is a disgustingly cruel practice. It should be illegal it is animal cruelty it is human cruelty.

It is vital that the Riverview Dairv be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now

22

* Massive water use: Riverview would pump up to 226 million gallons/vear from an off-site well-nearlv as much as the entire Citv of Morris (permitted for 300 million gallons/vear for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquic manure and wastewater annually, plus 26.400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, desianated sensitive: the nearest waters--the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a ful understanding of groundwater anc water-quality risks is irresponsible. It is critical that the MPCA require a ful Environmental Impact Statement.

Jeremy Culver **Letter 341**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/ year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Laura Aldrich-Wolfe **Letter 342**

The proposed project requires a full environmental impact statement. Even without one, it is obvious that this project is incompatible with a state that values its lands and waters. CAFOs enrich a few at the expense of many, bringing minimal economic benefits and very high environmental costs.

Faustine Micheyl Moran **Letter 343**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Kelley Parker **Letter 344**

It is vital that we require this riverview dairy expansion project to run an environmental impact study before it's approved.

Kaitlin Kramer **Letter 345**

The West River Dairy Expansion would result in enormous environmental harm to its surroundings; massive water use and waste output would be highly detrimental to the groundwater reserves and the Pomme de Terre watershed where the expansion would sit.

Bonita Underbakke **Letter 346**

The EAW is merely assurance by the proposer that all is well. The Riverview Expansion project needs a thorough Environmental Impact Study to recognize risks across the board, and how, if possible, to prevent permanent damages.

A healthy rural future is essential; myopic focus on short-term profits is predictably destructive.

Laura Haule **Letter 347**

It is inconceivable that a dairy operation of this size will not heavily impact soil, water, and air quality in the surrounding area. Riverview Dairy should be required to submit an environmental impact statement. It will drain local water resources and create hundreds of millions of gallons of wastewater annually. Groundwater impacts are unknown. This should not go forward without knowing environmental impacts. Water resources in the area are unknown, so permitting a heavy water user does not sound appropriate. A full environmental Impact Statement should be required.

Dylan Summerville, Summerville Electric **Letter 348**

Letter of Support for West River Dairy Expansion

Vendor of Riverview Dairy

Subject: Support for West River Dairy Expansion

My name is Dylan Summerville Owner of Summerville Electric based out of Breckenridge MN. We currently have two dairies owned and operated by Riverview in our county. I am writing here today for my support for West River Dairy Expansion.

In working with Riverview LLP through the years, from wiring new facilities to daily service work they have been a great customer to work for. They value their employees within Riverview and truly value their outside relationships whether they be venders, local farmers, neighbors and the local communities. They are very proactive in their daily operations to make their dairies efficient, modernized and immaculately clean. Working alongside them firsthand makes it clear that their commitment and dedication to their facilities do not go unnoticed. They work hard to keep these spaces safe, well-maintained, and accountable--reflecting values that many in our community appreciate and rely on.

Riverview has been a huge partner with Summerville Electric, not only helping our operation for Electrical, but has helped our business grow. In working with them it has allowed us to find other ways to grow our business such as providing services within their daily operations and by starting other businesses and employing additional people. Working with Riverview, they maintain high expectations and strong standards—not only for themselves, but for everyone around them. These core values have helped strengthen not only their own work, but also the people they collaborate with, including vendors, local farmers, and the surrounding communities, making all of us stronger and better together.

Riverview is always looking at the economic impact they can make on a community. They are very involved in community actions, and very actively looking to employ residents to contribute to their dairy and farming operations. Riverview embraces opportunity for those around them and focuses on the word team (Community). I firmly believe the West River Dairy expansion will continue to reflect the same level of care, professionalism, and positive impact they have provided and will continue to strive for within their operations.

Sincerely,

Dylan Summerville

Paige Van Pelt **Letter 349**

If this doubling of the size of Minnesota's current CAFO capacity can be approved without a full environmental review process, we are truly in trouble. I find it creepy that agricultural interests in our state would try to slide this under the door rather than achieve a legitimate approval. Operating in this fashion betrays the trust of the public and weakens our state.

Jack Judkins, Grandpa Roy's Pickles **Letter 350**

Industrial scale agriculture has been an environmental disaster, to say nothing about animal welfare (cruelty). Listen to the folks most affected. Deny the Riverview permit.

Katie Hauge **Letter 351**

This is just simply horrible... as a small family farmer who is hoping to keep our little farm going, we need to stop more expansion from the corporate farms! We are being swallowed up by these giant corporate farms, wells are a problem, river pollution is a problem. If this passes it's because the pockets are too deep!

Peg Furshong **Letter 352**

Do you ever say no? How many is too many cows? How much does this operation actually pay for their water - all that water for the cows and to grow the feed? This is North America's largest dairy operation - the largest - The Minnesota River Basin is overrun with manure from CAFO's - and you are continuing to permit more facilities. This proposed project expansion is on sensitive ground - there are wetlands just to the south of the proposed site. What we know about wetlands is that they are a complex network of capillaries and underground water pathways that goes significantly beyond what we can see above ground - This proposal needs a comprehensive EAW and the impacts to local well water and the Pomme de Terre River.

What is the threshold for saying no - just because someone wants to built it - doesn't meet that we have the land and water to support it. The impacts on the surrounding area is significant. This operation has become a monopoly in the dairy industry and has put many small family farms out of business. At some point the well being of the greater community and the future of our water, air and soil health should outweigh the economic interests of this company.

Respectfully,

P & S Petrich

Lauren Robinson **Letter 353**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Lisa Cain **Letter 354**

Due to past problems with water access for neighbors, possible degradation of our water quality, and just the sheer size of the proposed dairy, I believe very thorough studies should be done before this project would even be considered. Our way of life and that of our wetlands too are at stake.

This is too large an operation for our area.

Thank you for your time in reading my comments.

Lisa Cain

Gage Norton **Letter 355**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Patrick Brueske **Letter 356**

Hello.

This comes strongly urging an environmental impact study for the proposed West River Dairy Expansion in Stevens County, Minnesota.

Thank you for giving a read and for next steps being taken for addressing this.

Respectfully,

Patrick Brueske

Becca Golden **Letter 357**

These mega-dairies are one of the worst things to happen to Chippewa and Swift County. They are nothing more than massive land grabs by a small group of people who claim these operations "help the community," when in reality it's simply greed feeding greed.

What they don't tell the public is the real cost--paid by local taxpayers:

1. Damaged roads: Rural roads are deteriorating under the weight of constant heavy truck traffic, leaving counties to foot the repair bill.

2. Subsidized labor: These operations bring in H-2A workers and then receive subsides for their food, housing, and wages--another hidden benefit that doesn't help the community at all.

3. Strained schools: Our school districts are overwhelmed, especially as they work to support students whose families come to the dairies and who are still learning English.

Take a step back and ask: Who actually benefits?

From where I live, it's clear that the dairies and the large farming operations tied to them are trying to grab and control every acre possible. They are not your friends or your neighbors; they are businesses determined to expand at any cost.

On top of that, they work to place their people on township boards, planning and zoning boards, and other local government committees--giving them influence at every level while the broader community pays the price.

Mega-dairies don't strengthen our counties--they hollow them out.

Stuart Knappmiller **Letter358**

Growing up on a 28 cow 228 acre farm, I saw our livestock use Stumptown Creek as a toilet. Our septic tank flowed water into the pasture near a tree I stayed away from.

20 years later, we had no livestock near the creek, a new up to date field for our waste. It would seem to me 26,000 cattle might do more damage than our 28 cows. Dad applied anhydrous ammonia on our neighbor's corn fields. He needed the money to buy the land. That polluted our well water.

Do an EIS.

Carlos Gutierrez **Letter 359**

I am a Stevens County resident, and I am in favor of the expansion of West River Dairy. I am familiar with Riverview's farms, and I know they always try to do things the right way. Riverview provides jobs in our area. They also care about protecting the environment and taking care of their neighbors and communities where they operate. West River is a clean farm with manure properly handled and contained. this manure is used on fields near the dairy after silage harvest and following state requirements. I know some guys who help apply manure for Riverview and they have to follow a lot of rules and do inspections. I am not an expert in government and permitting but I know that the state reviews just about every aspect of projects like this. It has been about two years since I first heard about this expansion for Riverview and I believe they've been working on permitting all this time. Please give West River a permit for the expansion.

Thank you

Dawn Cook Ronningen **Letter 360**

This is a horrid idea. Please I want to see a complete environmental study and economic assessment.

This needs to be done before any further advancement of the project.

Itzel Herrera **Letter 361**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sarah Winikoff **Letter 362**

I think that the proposed project should be rejected.

As a PhD aquatic ecologist and freshwater biologist, I see the proposed project as a threat to public health in the nearby communities.

Confined animal operations have long been known to degrade surface and groundwater supplies by increasing the incidence of fecal coliform, increasing nitrogen and phosphorous loading, and increasing the concentration and prevalence of antibiotic resistant bacterial communities.

I have further concerns about how the proposed project will influence water availability to nearby communities as climate change continues to alter water availability in space and time.

Finally, I see the proposed project as a potential threat to community health because a confined animal operation of this size increases the risk of rapid pathogen spread should one of the emerging viruses establish within the herd (e.g., avian influenza). Not only would this hurt the cattle in such an operation, but concentrating animals in these quantities increases the risk of spread to human populations as well.

In conclusion, I am opposed to an animal confinement operation of this size and magnitude anywhere, but particularly in a small rural community when there has been little or no environmental impact assessment.

Barbara Burke **Letter 363**

The Riverview expansion should require a full EIS.

GHG testing and estimating that was done as part of the Environmental Assessment Worksheet was based only on the number of cows they intend to add, not including the base amount of cows they already have. This leaves an incomplete picture of the true costs to the environment, the community, the water, and the land.

Riverview has a recent history of manure spills in western Minnesota.

The Environmental Assessment Worksheet prepared for this project claims that the project will overall reduce GHG emissions because they will not be using anhydrous ammonia on the fields that have manure being spread on them. This grossly undercounts the true emissions of an operation of this scale and must be reviewed further in a full Environmental Impact Statement.

Darlene Eckert **Letter 364**

It seems that Minnesota's ground water is under attack from all sides. Mining, ai farms and big ag businesses. The quantity of water they will use and pollute is unacceptable. Can they treat and reuse the treated water instead of using fresh water? This seems like the perfect way to introduce nitrates into large areas of our groundwater . Will that mean users of groundwater in areas where waste is spread will need to upgrade their home wells or home treatment systems? I am also concerned by the smell. Driving through areas with huge feedlots really stink even in cities near huge feedlots by like Colorado going out of Denver and North Platte, Nebraska. If you're going to spread liquid manure over huge areas then huge areas will stink.

Basically I am saying that this does not benefit the community, small farmers or other water users. I don't think this would be acceptable unless they come up with an environmentally sound method to manage manure that doesn't contribute to nitrate contamination in local wells.

Helene Murray **Letter 365**

A dairy of this size has the potential to have severe, adverse environmental impacts. An EIS is needed to determine to what extent this facility will have on the environment and area.

Jody Snow **Letter 366**

As a Morris, Minnesota resident for almost 20 years, I would like to voice my opposition to the expansion project proposed. The leadership of the LLC exploits workers, breaks contracts, and are not good stewards of the land they currently possess. They will cut corners to make more of a profit. The amount of resources required for such an expansion will put the entire community at risk, people I worked with and care about.

I encourage you not to approve it!

Jan Kaeter **Letter 367**

I oppose any opperation of this size with the volume of water used and the affects it would have on the local aquafers to the amount of waste produced not to mention the methane gas released. This opperation is not a farm it is an industrial plant not unlike an oil refinery and should have a rigorous environmental impact study before any permit is even considered.

Ann DuHamel **Letter 368**

As a resident of Stevens county for almost 17 years, I am EXTREMELY concerned about this proposed expansion, and how it will impact both the quality of life for the people who live here as well as the environmental impacts for water, flora, and fauna in the area.

I wholeheartedly agree with the Land Stewardship Project that a full Environmental Impact Statement must be completed, because of these reasons:

- GHG testing and estimating as part of the Environmental Assessment Worksheet was based only on the number of cows Riverview LLP intends to add, not including the base amount of cows they already have. This leaves an incomplete picture of the true costs to the environment, the community, the water, and the land.

- This proposed operation is the first of its size in Minnesota. It would be nearly DOUBLE the size of the next largest livestock operation in our state in terms of animal units. This makes it a fundamentally new

and particularly powerful threat to Minnesota farmers and rural communities. The MPCA should give it scrutiny as such.

- Riverview has a recent history of manure spills in western Minnesota. (YIKES!) In Arizona, the company recently agreed to deliver $11 million to residents affected by the dairy's overpumping.

- The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

- Minnesota has lost 528 dairy farms in the last 4 years, and what's even more concerning, has lost 1,987 dairy farms since 2017. Our state is losing dozens of dairy farms a year due to inconsistent and often below cost-of-production milk prices. This disaster in price is largely caused by massive dairy operations, being able to glut the milk market with cheaper-to-produce milk, making it hard for smaller family farms to compete. As a descendant of Minnesota dairy farmers, this expansion seems contrary to the spirit of supporting our hard-working citizens and farmers.

- The Environmental Assessment Worksheet prepared for this project claims that the project will overall reduce GHG emissions because they will not be using anhydrous ammonia on the fields that have manure being spread on them. This grossly undercounts the true emissions of an operation of this scale and must be reviewed further in a full Environmental Impact Statement.

Thank you for your consideration!

Elena Machkasova **Letter 369**

As a resident of Morris, MN, I am very concerned about the environmental effects of the proposed Riverview Dairy expansion. The project of such scale has a potential to negatively effect the environment in a variety of ways.

The proposed location is within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A possible manure spill would be devastating to the livelihood of nearby population, farms, and wildlife. The changed landscape would also affect plants and insects habitats and may create a potential for animal and plant diseases spreading to nearby family farms and other small agricultural businesses. The consequences of building such an unprecedented project need to be thoroughly evaluated.

The project of this size must undergo a full and thorough Environmental Impact Statement. This is a matter of highest importance for Morris and its surrounding areas.

Sincerely,

Elena Machkasova

Heather Stefanek-Peters **Letter 370**

As a resident of Stevens County MN, where the proposed Riverview Dairy expansion would be located, I am concerned about its environmental impact and would like the MPCA to require a full Environmental Impact Statement before the project can go forward. This project would more than double the size of Riverview's dairy operation in Stevens County, with the final size being almost twice as large as the next largest livestock operation in our state in terms of animal units. A project of this unprecedented scope demands particular care in reviewing its impacts, which a full Environmental Impact Statement would

provide. In addition, I believe it is important for the EIS to take into account the total projected size of Riverview's Stevens County dairy operations, including existing animal units, not just the size of the expansion. Total size matters because the larger the total size, the larger the potential impact if something goes wrong. For example, Riverview's Feb. 2025 manure spill in Kandiyohi County likely spilled approximately the same amount of manure in 5 days that an average sized MN dairy farm would produce in 6 months, based on early reports.

Jim Bambenek **Letter 371**

For the health and safety of our environment, water, clean air and soil health, please say no !

Anna Larsson **Letter 372**

The Riverview Dairy must be required to submit an environmental impact statement. This proposed farm is almost twice as big as any current Minnesota dairy operation. It will cause enormous environmental damage. I am an environmental educator, and here are the main concerns I have about this farm.

• Poo-lution The 11,000 proposed new cattle will create almost as much biological waste as all the people in Saint Paul. And this waste doesn't get treated in a sewage treatment facility. Instead, it gets sprayed on nearby fields. The Pomme de Terre watershed is designated "sensitive," and the Pomme de Terre River is already listed as "impaired". Adding this much waste to the watershed will almost certainly worsen the situation.

• Water Use The farm will pump up to 226 million gallons of water per year from the aquifer. Is this a little or a lot relative to what the area can handle? I don't know, and neither does anyone else. The DNR hasn't analyzed what this means in the context of what the environment can handle. It is irresponsible to permit such large withdrawals without knowing if the system can handle it. What we do know is that throughout the US, groundwater resources have been declining. This is an issue that needs to be evaluated before the project moves forward.

Advancing permits without a full understanding of water-quality and groundwater risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Dairy consumption in the US is flat. The only way adding a dairy of this size makes sense is if they are expecting to push other, family-scale dairies out of business, or if they are planning to export their products to other countries. Neither reason is justification for harming our beautiful, clean Minnesota environment.

Rhyan Schicker **Letter 373**

Thank you for reading my comment. I am extremely worried and frustrated by the Riverview Dairy proposal to install the largest CAFO MN has ever seen in the area where I live, work and recreate on the local waterways.

MN has a climate action plan with tangible goals set for 2030 and beyond. This proposal would move us against those goals as the emissions from the cows, the usage of water and the transportation of cattle would cause significant impacts to the state. The water usage outline by Riverview is as much as the town of Morris is allowed- so where is that water coming from? Are we willing to empty our already limited aquifers in the name of a mega corporation over our own residents? At the very least we need an environmental impact statement so we can make sure we are aware of the risks, and who the risks will affect were something to go wrong or over pumping to occur. Riverview has a history of over

pumping and is currently facing a multi million dollar pay out to residents they affected by over pumping in AZ- a state so obviously in need of proper water usage as they are currently experiencing water shortages, how would we trust them to follow rules set in MN? (Inside Climate News; Arizona Comes to Agreement With Major Dairy Farm to Cut Groundwater Pumping That Is Draining Wells)

Riverview also had a recent MN spill in this area with limited transparency on results and impacts to the surrounding residents.

I work with farmers everyday. The amount of small farms in MN, especially small dairies has seen a devastating downfall. MN is supposed to be a state the leads the way in climate action, sustainability and care of residents. It is really hard to see how this huge feedlot is good for anyone other than Riverview. When is enough enough? We are going to continue losing small farm families and residents in our small towns, which are in need of revitalization efforts- not support for huge mega operations whose use of resources greatly overshadows the need of local residents and businesses.

Due to the unprecedented size of the facility, an Environmental Impact Statement should be done. It's what's right for our communities. MPCA needs to find a way to start putting the needs of our communities over the needs of a small percentage of large corporations and saying no to projects that go against our state climate action plan, our natural resources and wellbeing of our communities.

Please consider the need for a EIS.

Thank you for hearing my concerns,

Rhyan Schicker

Carole Fernholz **Letter 374**

In my opinion, this is far too many animals proposed in this project and must have a thorough environmental review! These massive dairy operations have glutted the market and tightened their hold on the industry. This project would push more family farmers out and decimate our main street businesses. Inconsistent and below cost of production prices are affecting smaller family farms. The area where this operation is proposed is already considered a "sensitive watershed." This massive dairy project would only do more damage. There NEEDS to be an EIS (Environmental Impact Statement) done before they are allowed to go forward.

Thank you.

Mariah McMahon **Letter 375**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

James Harkness **Letter 376**

I am strongly opposed to moving forward with this proposed expansion without a much more comprehensive environmental and socioeconomic review. Riverview's plan would blanket a huge area with manure, and I do not see sufficient evidence that it will neither create severe air and water pollution, the latter especially during extreme weather events. I am alarmed at the apparent assumption that there is no need to look seriously at the risk to the Pomme de Terre and Minnesota River watersheds. This company does not have a good record, so assurances about solid and liquid waste management practices ring hollow to me!

The water demand is also excessive.

Cary Anderson **Letter 377**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Tyler Scott **Letter 378**

3/12/26

Dear MPCA,

I have lived withing a ¼ mile of another Stevens County Riverview dairy for the last 10 years. In that time, we've had no water quality or supply issues with our well. Riverview excels in neighbor relations, maintain A dust control on roads, resolving concerns promptly, and minimizing odor.

My experience in the dairy industry is that Riverview is top-tier in cleanliness and site upkeep.. Dairy manure not only sustains soil health but also helps retain carbon locally, a natural and sustainable

approach to helping the environment. I feel that Riverview adds a lot to our community which has provided opportunity for that next generation to live in this area.

I encourage the MPCA to prioritize feedback from those of us living near these operations, not from those afar. I support the West River Dairy Expansion in Stevens County.

Sincerely,

Tyler Scott

Cora Gertjejanssen **Letter 379**

I am writing to plead that an environmental assessment be required for a project of this size. It is well known that feedlots have detrimental effects on the environment, such as potential manure spills or mismanagement and intensive water usage. We have a duty to protect our wildlife and natural resources from unintended consequences of large operations such as these. Not to mention, the impact on our small farmers - this will be driving more and more small farmers out of business and taking away their acres of land, when we as a state have a responsibility to support them and not hand over their businesses to corporations. Please consider doing a full environmental review of this proposed expansion and I thank you for your time.

Ramona Heitmann **Letter 380**

I am strongly opposed to the expansion of Riverview Dairy. The operation is already large and has caused problems with both groundwater extraction beyond what the current wells can handle sustainably and the waste generated also has caused issues. The other wells in the area are at risk due to overuse.

The air pollution caused by an expansion is also problematic. Such a large operation is not conducive to animal welfare nor human health. I strongly encourage the MPCA to deny the application for expansion.

Anna Mehlhoff **Letter 381**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

-Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

-Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters, the Pomme de Terre River and a nearby unnamed creek, are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Mary Longfellow **Letter 382**

Do the right thing for your future self and your prodigy. We shouldn't need to convince you this is simply bad form and isn't needed. The pressure on you and us by corporate entities has to stop. It's destructive and inhumane. Do the right thing instead. It will build your character and you'll thank yourself later.

Gayl Gustafson **Letter 383**

Please get an environmental impact evaluation on this CAFO expansion before permission to build is given

Brooke Reynolds **Letter 384**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Michelle Gobely **Letter 385**

Please require an EIS for this outrageously sized proposed dairy! Thank you!

Andrew Steiner **Letter 386**

To Whom It May Concern,

My name is Andrew Steiner, and I am writing as a local resident, a high school agricultural educator, and a small business owner in the Morris area. I have toured Riverview facilities several times over the years and regularly bring high school students to visit their dairy operations as part of our agricultural education program. I also know many Riverview employees and managers personally. Based on my experiences and what I have seen firsthand, I support this project and believe the Environmental Assessment Worksheet (EAW) process is sufficient. I do not believe a full Environmental Impact Statement (EIS) is necessary.

One thing that has been disappointing to see during the comment period is how many opinions seem to come from people who are unfamiliar with the area or with Riverview's operations. Riverview has built a very strong reputation in our community. Their facilities are well run, and they have always been willing

to host tours and answer questions. Every time I have visited with students, the facilities have been clean, organized, and clearly managed with professionalism and attention to detail.

Some of the concerns raised about manure management also appear to overlook the fact that these systems are already heavily regulated. Projects like this must operate under MPCA feedlot permits and detailed manure management plans. In this case, the proposed facility includes more than a year of manure storage capacity and access to far more acres for manure application than are actually required. Those requirements exist specifically to protect water quality and ensure nutrients are applied responsibly.

I would also encourage reviewers to look carefully at the actual water monitoring data for the watershed. Monitoring in the Pomme de Terre River watershed has shown that overall water quality conditions and biological health have remained relatively stable over the past decade, even though agriculture has been a major land use in this region for generations. Concerns about impacts to waters such as the Pomme de Terre River, Drywood Creek, and Muddy Creek should be evaluated in the context of this long-term data.

Another concern raised by some commenters involves water use. Groundwater withdrawals for projects like this are reviewed and permitted by the Minnesota Department of Natural Resources. That process exists specifically to ensure aquifers are used sustainably. It is important to remember that many other industries and communities also rely on groundwater, and all of them are regulated through the same permitting process.

Beyond the environmental review, it is also important to recognize the role Riverview plays in our local economy. As a small business owner, I see firsthand how much large employers like Riverview contribute to the stability of rural communities. Their operations support local suppliers, contractors, and many other small businesses throughout the region.

Riverview has also been extremely supportive of agricultural education. As a teacher, I think it is important for students to see what modern agriculture actually looks like. Riverview has consistently opened their doors to students so they can learn about animal care, technology, and the science behind food production. Those opportunities are incredibly valuable for young people who are interested in agriculture and environmental careers.

In closing, I encourage the agencies reviewing this project to rely on the available data and the existing regulatory process. From what I have seen personally and from what the monitoring data shows, the EAW has already provided a thorough review of potential environmental impacts. For those reasons, I believe the EAW is sufficient and that preparation of a full Environmental Impact Statement is not necessary.

Sincerely,

Andrew Steiner

Tanner Davison **Letter 387**

Riverview dairy should be granted the permit for expansion. As a farmer that has worked with them on other dairies they have always done what they said, and make things fair and right when circumstances change. As the Mayor of Wendell they have been very generous with the community, supporting multiple fundraising events for city improvements and were a main reason our fire department was able to cover the costs of expensive upgrades with our fire turnout gear.

They have been a great and welcomed addition to our area.

As far as running a dairy, I challenge you to find one that is better run. They as always clean and pleasant looking, there is very rarely an odor. The only smell is usually for a few days when they are doing field manure application, and that is a welcomed event by any and all farmers that are able to receive the application.

I have had many interactions with many of their employees on all levels of their operations, and they are all good people. They work hard and love what they do. It is amazing to have a business that is able and willing to grow in our small communities. We should welcome it and help facilitate it. This is why I support their expansion efforts, Thank You!

Francisco Guadarrama Capitaine **Letter 388**

To whom it may concern.

I want to express my support to the West River Dairy Expansion project; I have known about Riverview for over 6 years. This includes touring their farms in different states.

This opportunity has given me an insight of Riverview, the more I know about who Riverview really is, the more I realized it is something good and not only for the employees or vendors who work directly but also for the communities, townships and counties where Riverview operates.

No matter the circumstances Riverview sites comply with the regulations, laws and even go beyond, sites are clean, organized, with minimal flies, minimal odor even during manure pumping season in the fall.

After harvest and pumping season, the roads are always taken care of, and it is always about people.

Thanks,

Francisco Guadarrama Capitaine

Jodi Williams **Letter 389**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

* Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

* Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

* Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

* Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement

Joyce Borgerding **Letter 390**

Minnesota's water is the most important resource we have! I've moved from western Wisconsin in this past year, so I know first hand the effects of CAFOs. Don't let corporate money get in the way of protecting water for all.

Tayler Williamson **Letter 391**

It is extremely important to me that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Riverview, in addition to the devastating ethical and inhumane nature of dairy farming would have a negative impact on the surrounding natural environment in the form of millions of gallons of water used, enormous waste output in a critical migratory bird habitat, and groundwater impacts that have not yet been evaluated by the DNR via a hydrologic survey and we don't know what impact such massive water withdrawals would have on aquifers. If this expansion were to happen, there would be catastrophic impact to sensitive waters in the Pomme de Terre watershed. Continuing this effort without a full understanding of water quality and habitat impacts is wrong and not right for Minnesota. I demand that the MPCA require a full environmental impact statement for review. I again reiterate that this is in effort to mitigate additional damages that would be brought to the surrounding animals and environment in addition to the already treacherous atrocities committed each day against the cows subject to dairy farming.

Please do the right thing here.

Paul Golden **Letter 392**

Dear Mcap,

As a very concerned citizen who lives and farms by one of their sites other then this one I can't emphasize enough that they need to be stopped from further expansion at this site and other sites in the future

1- I'm very concerned about our environment and our water quality and supply from the stain they put on everything.

2- I know there has been manure spills that have been cleaned up before they are reported to the MPCA.

3- I have watched what use to be a very peaceful and safe area to live and farm in to become a very unsafe area to live and farm in because of them. Our rural area is deteriorating very from fast from them now and our quality of the environment also.

4- The traffic increase from them is really high and basically hazardous. State highways 29 and 40 have heavy traffic use from them all the year along.

5- The manure smell at many times is really bad at times of the year and can be smelt from a distance of 4-5 miles away.

When they are hauling the solids manure as they call it from their sites I have saw over the years there is dry manure being spilled all over the roadways from the trucks that are hauling it.

6- I can't emphasize enough about our environment and our water supply and our quality of water. Both are very precious resources.

7- I see the bad side and ill side of these large dairies everyday now by living and farming by one. I'm all for livestock and farming/ag in general but this isn't farming or milking cows at all.

8- They need to be required to do a EIS.

Who is really benefiting from these large scale dairies from this entity?

As a very concerned citizen I can't empathize enough that this has to be stopped before it's all too late for everyone and our environment. I'm afraid it's already too late almost.

Sincerely a very concerned citizen,

Paul Golden

Kelle Green **Letter 393**

They say an ounce of prevention is worth a pound of cure. Riverview, LLP's operation has the potential to pollute nearby already-fragile waterways. And a proposal that would generate over 200 million gallons of liquid manure and wastewater annually–plus 26,400 tons of solid manure–should be examined with great care.

The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawal.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible.

We Minnesotans take pride in our clean environment and this factory farm has the potential to create long-term, negative consequences to our land and water. It is critical that the MPCA require a full Environmental Impact Statement.

Jenell Holden **Letter 394**

I'd rather see more community gardens

Edi Thorstensson **Letter 395**

A dairy of this size should be required to meet high standards, both in production and environmental stewardship. It should be required to file an EIS and to maintain the highest standards in its operation. I frankly am concerned that, because of its size and influence, ir won't.

Jenell Holden **Letter 396**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ben Knelman **Letter 397**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now:

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

K Shomion **Letter 398**

Stop! No body wants this. Ruining our water, land and environment!!!

Disgusting

Caitlin Rathbone **Letter 399**

I would like to require an environmental assessment for this project. The harms that factory farming has on people and the environment are massive and it wouldn't be in the best interests of anyone to have this farm.

Amy LeBeau **Letter 400**

t is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Please don't allow this project to move forward without an environmental impact review.

Thank you,

Amy LeBeau

Tim Ahrens **Letter 401**

The MPCA's repeated refusal to order EIS reviews for extremely largescale feedlot projects is an absolute failure to honor the intent and purpose of MEPA, and the protections it provides. If you don't believe me, ask John Herman and Chuck Dayton.

Environmental Impact Statements under the law are simply more extensive reviews that projects of this complexity must warrant, and applicants must undergo. Proposals even beyond the multi-thousand animal unit scale, and into the tens of thousands of animal unit scale will soon end up exposing the negligence of the agency in failing to order EIS level reviews when they are so blatantly warranted. Facilities of this magnitude in other states have literally displaced material human populations through their depletion of aquifers, surface water bodies, and other environmental harms. If a failure to thoroughly study this proposal leads to a similar outcome in Minnesota, I believe the systemic history of mismanaged environmental review processes by the MPCA will be drawn to the surface. The thousands of documented pleas the MPCA has received from Minnesota residents to honor entitled protections under MEPA may finally command the attention they have always deserved. Natural resources in America's West are depleting at a level that makes the future construction of facilities such as proposed unviable in those regions. The "shit-storm" is coming to Minnesota. Our only shelter, we as residents, and the MPCA as the accountable authority, will be a new adherence to intended conventions of Minnesota Environmental Review regarding NPDES permits, specifically ordering EIS statements when they are appropriate.

Thank you for your time. I always look forward to reading the creative responses left to my comments in your "findings of fact."

Jon Moser **Letter 402**

I am Jon Moser, we live and farm 3 miles East of West River Dairy. We are not financially involved with Riverview. We do support the 11,000 cow expansion of West River Dairy.

Riverview has been a leader in dairy production in many areas.

In my 40 plus years of farming in Stevens County, I have never had issues working with them. They have proven to me to be very credible in their dealings. We use them for another marketing option for crops, and in return, we are able to purchase manure to be used as fertilizer for our growing crops. It is a win-win situation for sustainable agriculture.

As a close neighboring farm family, I do support expanding West River Dairy. This gives an even greater opportunity for us. I do not support an Environmental Impact Study for the expansion, and Riverview has shown to be an incredibly responsible producer and neighbor, and has the track record to prove it.

Respectfully submitted-

Jon Moser

Jane Dow **Letter 403**

Please do not permit this dairy farm for expansion. This large a number of cattle is environmentally a disaster, totally inhumane to the animals and unhealthy for the community where it is located.

This large a facility is totally unacceptable. I think you know that too so don't permit it. Thank you.

Hannah Bernhardt **Letter 404**

I am a farmer and this size project will absolutely have an outsized environmental impact on Minnesota's water, soil, and air. I work closely with my county Soil and Water Conservation District and am Minnesota Agricultural Water Quality Certified because it is the responsible thing to do. We have the right to farm, but I know that how I farm affects my neighbors. I expect reasonable regulation of any industry that impacts public health and well being. Thank you.

Holly Grise **Letter 405**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well-nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

-Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek

—are already listed as impaired. The project would likely worsen these impairments. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Morris is an important community that has touched many more lives than just the people currently living there. Every town sees people coming and go, especially college towns. They deserve an independent environmental impact study to be done to see what the estimated impact to the surrounding community would be if this unprecedentedly large farm were opened. No matter how small or large a community is, every single one deserves an environmentally safe place to live.

Kevin Hohn **Letter 406**

Riverview Dairy must be required to submit an environmental impact statement. A farm that large will cause serious environmental issues including massive water use and possible poisoning of groundwater.

Marshall Hoffman **Letter 407**

As a resident of Stevens County, I am very troubled by the possible expansion of the West River Dairy. The sheer enormity of this proposed expansion warrants a full Environmental Impact Statement. The City of Morris is already effected by the smell of the dairy, especially on summer days, and doubling the herd will only make this problem worse. And that's not even touching on the millions of gallons of manure waste that would be generated. I am also against the conglomeration in the ag industry and the squeezing out of smaller family farms, the backbone of rural Minnesota, with anti-competitive practices. The expansion also seeks to use a tremendous amount of the area's water. Riverview already has a track record of questionable ethical practices regarding the use of water and overpumping at their Arizona operation. The amount of pumping they want to do annually in West Central Minnesota would equal about 75% of the amount of water that is pumped for the entire city of Morris. There are also a number of wildlife protection areas nearby the dairy and manure spills -- which Riverview has had in recent years in this area -- would be disastrous for these lovely areas. Our family has taken walks and enjoyed these protected areas over the years and we would not want to see it harmed or damaged. In short, a full Environmental Impact Statement must be required before this proposal by Riverview moves forward.

Sharon Fortunak **Letter 408**

The MPCA must require a full EIS!

Negatives of this proposal--massive water use, huge wastewater output, ground water impacts, sensitive, already impaired waters.

Julia Hoffman **Letter 409**

I am a resident of Stevens County. I am very troubled by the possible expansion of the West River Dairy. The size of the proposed operation is too big for our community. MPCA needs to scutinize the environmental, hydrological, pollution and economic effects on our community. This proposal by Riverview, LLP, must undergo a full Environmental Impact Statement (EIS).

Riverview has a recent history of manure spills in western Minnesota. In Arizona it paid $11 million to residents affected by dairy water overpumping. The proposed Stevens County site sits within 5 miles of eight different protected waterfowl and wildlife areas and is a part of Pomme De Terre River Watershed, 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

The city of Morris has already a smell of manure from existing West River Dairy on many days of the year. Building CAFO that will hold over 20,000 animal units will make this problem worse. I am against squeezing out small farmers and replacing them with huge dairy conglomerates. Small farmers know how to be better stewards of the land than massive dairy operations.

I am also concerned about water overuse and contamination of surrounding areas by millions of gallons of manure waste disposal.

In summary, I am calling for a full Environmental Impact Statement before the Riverview expansion proposal moves forward.

Winston Kaehler **Letter 410**

The proposed expansion of the West River Dairy is a bad idea.

Renee Obrecht-Como **Letter 411**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. This expansion would also further erode the ability of small dairies to survive. Having grown up in Marshall, MN, with friends who worked dairy farms, it is heartbreaking to witness the destruction of their way of life in favor of mega operations that are brutal for workers, animals, surrounding communities, and the environment. Here's what we know now:

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement. Thank you for your consideration.

Dean Vital **Letter 412**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Jonathan P **Letter 413**

Dean Vital

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Rachel Day **Letter 417**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we Know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired.

The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Mark Paquette **Letter 418**

THE RIVERVIEW DAIRY PROJECT MUST BE REQUIRED TO GET AN ENVIRONMENTAL IMPACT STATEMENT. And they must be prevented from wrecking our water and air.

Mary Abel **Letter 419**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Karen Nelson **Letter 420**

Please do all necessary steps to make sure water and environmental concerns are addressed before allowing Riverview Dairy from expanding. Minnesota's water and environment are under threat with this project. Protect Minnesota's environment for future generations.

Amy Leinen **Letter 421**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what I have learned-

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible.

It is critical that the MPCA require a full Environmental Impact Statement.

Thank you

Leslie Kaup **Letter 422**

I don't live near this proposed project, but I do live in a rural area, and I grew up in a different rural area, and I understand what large animal confinement operations can do to a community. First of all, the animals suffer. Stressed and crowded animals do not give healthy milk. Air and water quality suffer. Kids can't play outside because of the stench. Property values decrease.

I am asking that the MPCA require a full Environmental Impact Statement for the West River Dairy expansion. At a time when federal environmental regulations are being rolled back, we need to step up and make sure that Minnesota remains a state that takes care of our lands. This project would set a dangerous precedent in our state. Rural communities deserve clean air and clean water and safe and healthy foods.

Ian Radtke-Rosen **Letter 423**

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

No feedlot has ever undergone an Environmental Impact Statement (EIS) in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Minnesota Department of Natural Resources has not yet completed a mapping of Stevens County's groundwater resources and aquifers for their County Geologic Atlas Series. In fact, they have not even begun the hydrological survey of the county. It is irresponsible to other water users and residents of the area to move forward with this permit without a full understanding of the potential impacts.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

Cristina Ortiz **Letter 424**

As a local resident and community member, I'm very concerned about the potential environmental impacts of a project of this size. This project would apparently more than double the size of Riverview's

dairy operation in Stevens County, with the final size being almost twice as large as the next largest livestock operation in our state in terms of animal units. A proposal of this type seems worthy of some careful consideration about its possible impacts. Riverview had a previous manure spill in 2025 and we should be mindful of what could happen when things do not go exactly according to plan with an operation of this size.

Sherri Thissen **Letter 425**

12:09

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped-making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ashley Kittelson **Letter 426**

Please require Riverview Dairy to submit an environmental impact statement. It is nearly twice the size of current operations in the state, and the environmental damage could be enormous. The water usage would dramatically increase with unknown groundwater impacts as the DNR hasn't mapped groundwater resources in Stevens County. The nearby Pomme de Terre River are already listed as impaired. The tremendous increase in liquid manure could further damage the river's ecosystem.

Advancing permits without a full understanding of the groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Margi Preus **Letter 427**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

—Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

—Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

—Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

—Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

—

If you live near, studied in, or spend time around Morris, include that in your comment.

Nicole Frank **Letter 428**

I do not agree with allowing expansion. At the very least the likely impacts to to be assessed and reported for informed decision making. This needs to be a decision based on community wellbeing and health.

Nicole Frank

Stephen Leinen **Letter 429**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Suzanne Lommen **Letter 430**

Please STOP this massive, inhumane treatment of animals and environment! Please STOP the West River Dairy Expansion.

- Suzanne Lommen

Karen Watson **Letter 431**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Tim Phillips **Letter 432**

I attended college at the University of Minnesota Morris, and I believe it is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ray Canapini **Letter 433**

Do not expand this farm! The environmental damage would be horrible.

John Clifton **Letter 434**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Mark Robinson **Letter 435**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Caitlin Clemens **Letter 436**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sara Clifton **Letter 437**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Jennifer Fox **Letter 438**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Erika Nelson **Letter 439**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Many communities living within the vicinity of CAFOs have poor health outcomes as a direct result of the waste escapes into the air and ground water. As a former public health professional I know these impacts will be vast and will negatively impact the health of communities for generations.

Theresa Zingery **Letter 440**

For the safety of all, the Riverview Dairy project must be required to get an Environmental Impact Statement.

Jennifer Hill **Letter 441**

I don't understand how this could move forward without an EAW to inform decision makers on impacts to neighbors, the community at large, and the local watershed (possibly even beyond). Environmental externalities can no longer be ignored while while corporations extract wealth from our communities.

Norm Gross **Letter 442**

As a small family my farmer I would like to see more energy and $ go into keeping families on the land and keep rural America alive and vibrant. These huge corporation farms harm MN, the land and the local communities.

Paul Adams **Letter 443**

We farm right next to Riverviews North Ottawa dairy and it has been a good experience. We use manure from the dairy to fertilize our corn silage ground and we have had a very positive effect on yield and have been using less commercial fertilizer as a result. Farmers here are requesting more manure than the dairy can provide every year so the demand is there.

There is very little smell when applying manure because it is directly incorporated and a cover crop is usually applied to address any erosion concerns.

The DNR has strict rules on water usage that both farmers and the dairy must follow. There is concern about the amount of water being pumped for the dairy, but my own farm has irrigation systems that can legally pump about 50 million more gallons than the dairy is requesting and that is done in probably a 2 month window, not over the course of a year.

People have to remember that 1 inch of water on one acre of land is 27,185 gallons.

Riverview has supported our local schools and fire departments and brought more jobs and residents to our small farming community. I support the dairy expansion.

Owen Tesson **Letter 444**

I would like to express my opposition to this project. The threat to local Waters both above and below ground must be considered, as well as what will happen to dispose of the massive amount of feces and waste created.

Cathy Dolan **Letter 445**

I am requesting you do an Environmental Impact Statement Study of the River West Dairy Expansion. I support the Land Stewardship Projects concern about this proposed huge farm and it's impact on the land, people, cows, and community. Consider ALL effected by this decision. Small is Beautiful!

Lindsay Henkemeyer **Letter 446**

Factory farms go against everything the Minnesotan people and communities stand for. They believe in community, environment, health and wellbeing. Large scale factory farms are terrible for environment, animals, and surrounding family farms - family farming is what our agriculture is built on and we need to do better in making it easier for small farms family farms to keep their land, to grow, to thrive. When they thrive we thrive. No one wants a creepy sad industrial farm in our beautiful state.

John Marks **Letter 447**

The West River Dairy Expansion proposal must have a full Environmental Impact Assessment. The way of life which the citizens of Minnesota value is based on clean water and clean air.

Concentrating so many dairy cows in one place will result in environmental damage. This high cost is not worth the end result- a high volumn of low-quality milk.

Maria Weir **Letter 448**

Hi, I am very concerned about this expansion. Please find my comments below.

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Ilga Polleitis **Letter 449**

An EIS is a must for something this huge and impactful.

Barbara Haag **Letter 450**

To Whom It May Concern,

My family home and surrounding land on Frog Lake (Gorter Lake on a map), with familial ownership dating back to the early 1920's to present, sits one mile north of the Riverview LLP dairy. I voiced my

concern when it was originally planned and talked to the MPCA at that time, as well. Despite my disapproval and that of many others in the community, the dairy operation went forward. My concerns over the water table and the tremendous amounts of animal waste are still at the forefront of my mind, especially since they have increased their capacity from their original plan and now have much larger wants. They have outbid the small farmer to gain more land when land is sold.

What are the working conditions in their barns and what wages do they offer that causes them to bypass American workers and seek cheaper labor and veterinarians from Mexico?

Our beautiful lake, Frog Lake, next to where my late parents' home sits and that I now own, is a wonderful place for waterfowl and game. Artists, naturalists, and conservationists have visited, written about, and painted the wildlife that are regular visitors to the lake, farm and prairie lands in the area. Because of those people and the wildlife, this area has become known to people around the state of Minnesota and the country. The abundance of varied waterfowl is amazing. What is not amazing is the odor that is carried on the wind from the Riverview Dairy (West River Dairy) one mile away. The odor is so offensive at times that you can't stay in the area. Enjoying the outdoors or having your windows open is impossible.

Most people don't know that the life of a dairy cow at a place like Riverview's is cut short by living all their life on a concrete slab, never being outside to graze in the pasture, and being milked 2 or 3 times per day. Have they not learned anything about how a dairy farm should be operated?

My parents left their home to me when they passed away as a place where my children and grandchildren could come to enjoy the beauty of the surrounding area and the family ties that connect us to this land. My brother continued farming this land after our dad passed away and he has now passed that legacy to his son and two grandsons. The Riverview Dairy (West River Dairy Expansion), just one mile away from where they live and farm, will be an even bigger threat to their health and livelihood if this operation increases capacity.

Let me end by saying this: When money is your god, your hunger to obtain it overtakes your ability for sound reason and compassion.

Sincerely,

Barbara (Holslin) Haag

Kendra Nielsen **Letter 451**

Dear Members of the MPCA,

It is hard to know where to begin when you are trying to save a place that is part of your own childhood and the area where your mother and extended family were raised and where some still live. When I say "save" that is not an overstatement. West River Dairy, overseen by Riverview LLP, and its proposed expansion threatens the health of the land, the water, the wildlife, and the people who live and visit in the surrounding area. Let me correct that slightly by saying it has ALREADY threatened those things and people since its inception, but now GRAVELY threatens the land, the water, the wildlife inhabitants and the people.

I truly believe it is greed that has been the motivation behind this dairy and the almighty dollar is now threatening an expansion of gross proportions. Gross in every sense of the word. I visit the area where my mom grew up - just one mile away from West River Dairy - several times a year, as do several of my siblings and their families. Every time, since the day the dairy operation began, we have to cross our fingers that the smell from the dairy doesn't hinder or completely wreck our plans during our time at

Frog Lake (Gorter Lake on the map) while visiting family nearby and staying at what was my grandparents' home which my mom owns now. The lights from the dairy can be easily seen across the field at night, that's how close it is.

My grandfather, Alfred Holslin, bought farmland back in the early 1920's and was married and began raising a family in the 1930's in the area that I am talking about that is so near the West River Dairy and proposed expansion. That legacy of farming was passed down to my uncle, Maurice Holslin, and continues to be carried on by my cousin, Mark Holslin, and his sons, Justin and William Holslin. Not only does an operation like West River Dairy and its overseer, Riverview, LLP, threaten the things I previously mentioned, but it also has a choke hold on the family farms in America. The average farmer can't compete with corporate or factory farms when it comes to buying land to expand their own operations. When I think about a Concentrated Animal Feeding Operation (CAFO), such as what is being proposed to expand, I think about my grandpa Al Holslin and how upset he would be over the confinement of such a large amount of animals for "maximizing efficiency" and in knowing what kind of decimation these operations cause to the land, the water, the animals, and the people exposed to it. This dairy and the proposed expansion is crushing my grandfather's dream for future generations. This is just one story. There are more.

Please listen. Don't allow the expansion to go forward.

Sincerely,

Kendra (Haag) Nielsen

Rhona Wilson **Letter 452**

An EIS should be ordered for this project due to its massive size, which is *11 times* larger than the minimum threshold for an EAW, its likely impacts on ground water and surface water, and the amount of greenhouse gases that are likely to be emitted. The estimated GHG of 66,324 tons per year is speculative and incomplete. A full EIS is necessary to determine the true impacts of this proposed operation.

Bridget Shankey **Letter 453**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact.

Mary C. Voight

I grew up in Morris and attended high school with the Riverview owners.

Do your job as pollution control agents for Minnesota taxpayers and prevent the massive and unnecessary expansion of a greedy operation by irreligious people that will pollute the air and soil you protect.

It does not serve the residents of Stevens County nor the land.

Rachel Nielsen **Letter 455**

My concerns regarding this project center on animal welfare and environmental impact. CAFOs pose well known and documented environmental risk not just due to manure management but as a result of destruction of grazing land and wildlife habitat.

Housing nearly 20,000 cows in such a small area is also an obvious animal welfare issue. Cows are biologically designed to graze, not to feed on grains in confinement. This poses many known health risks to the animals and is inherently cruel; collectively we should be moving away from this model of dairying.

Allowing this project to go forward would benefit only the company who will profit from the destruction of the land, the inhumane treatment of the animals, and the many risks to the environment (immediate, long term, and downsteam), and provide no to very little benefit to the people living in its vicinity or Minnesotans at large.

It would be very impressive should Riverview Dairy choose to move to a grazing model of dairy farming, which honors the lives of the cows and benefits our shared environment.

These are my own words.

Thank you for considering them.

Sincerely,

Rachel Nielsen

John Pierce **Letter 456**

Riverview Dairy must submit an environmental impact statement.

Dairy operations are notorious for water consumption AND for point source water pollution. Without an EIS, we will not know the potential harms to weigh against economic benefits.

Deborah Camasta **Letter 457**

Large scale factory farming is detrimental to society, small farms and ecosystems.

Lisa Goddard **Letter 458**

It's vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now:

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now. A completed hydrologic survey and geologic atlas will also help understand if the large amount of liquid manure and other pollutants could contaminate drinking water sources.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters (the Pomme de Terre River and a nearby unnamed creek) are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Nathan Huerkamp **Letter 459**

Let's conduct some due diligence.

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek-are already listed as impaired.

The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Christopher Loetscher **Letter 460**

The proposed Riverview CAFO threatens soil, water, and air quality, human health, and independent family dairy farms. A proposal of this magnitude, with its attendant threats, requires a full Environmental Impact Statement (EIS). I worked for the Diocese of New Ulm for 25 years, directing the Social Concerns and Family Life Offices. Over those years I witnessed farm crises, the erosion of rural communities, the concentration of agricultural production into fewer and fewer hands, the pollution of water, soil and air by large-scale hog and dairy operations. The Diocese of New Ulm is a fifteen county area. The Minnesota River runs diagonally through the area. How will the Riverview proposal affect the watershed feeding the Minnesota River? How will it affect the water and air quality of neighboring

towns, the health of neighbors, including students attending the University of Minnesota, Morris? A full EIS is needed.

George John Dubie **Letter 461**

PLEASE, PLEASE, Do not allow the mega-huge dairy farm in Stevens County. We don't need more environmental damage. These can be smaller and spread out more land wise. Thank You!

John Velie **Letter 462**

The owners of West River Dairy must be required to file an EIS. They must prove that the massive amount of manure this operation will produce will not negatively impact the groundwater systems in the area and they must prove they have a sanitary plan for disposing of all the dead animals this operation will produce.

Leslie McInenly **Letter 463**

Please do not approve this project without an EIS. I am concerned about water usage and waste management. I also have concerns about the size of these farming operations and related health of the animals.

Greta Conroy **Letter 464**

Housing this many dairy cows in one area would produce a very large amount of manure. If not carefully managed, manure runoff will contaminate nearby groundwater, rivers, and lakes with nitrogen and phosphorus. Along with its environmental impacts large dairy operations can also reduce quality of life in the surrounding areas. Manure produces strong odors and release gases that affect local air quality. The expansion will increase truck traffic, noise, and other disturbances in the community. This project will harm the environment and reduce the quality of life of Steven's County residents. The residents that you are expecting to sacrifice their quality of life will have no control over how noise and manure are managed, nor will they benefit from this expansion.

John Doe **Letter 465**

I would like comment in favor of Riverviews expansion. I do not live near a current Riverview dairy but I have seen there operation and the benefit it provides for the local community and economy.

Riverview provides a big economic booster for areas they operate in bringing in new crops and markets for area farmers. In return these farmers use manure replacing there need for synthetic fertilizers. I believe this I a "win-win" situation for everybody involved. I agree that we should try and save smaller family dairy's but that has become simply not viable in today's economy and I feel like the positives for this expansion out weight negatives

Sophie Hannig **Letter 466**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Joe Storlien **Letter 467**

To the MPCA review committee,

The proposed expansion of West River Dairy near Morris raises significant concerns about the environmental and community impacts associated with such a large-scale livestock operation. Increasing the herd to nearly 19,000 cows would create one of the largest dairy facilities in Minnesota and dramatically increase the volume of manure generated and stored on site. Managing and land-applying hundreds of millions of gallons of manure each year presents meaningful risks to soil health, groundwater, and nearby waterways if nutrients are over-applied or if storage systems fail.

The project's projected water use—hundreds of millions of gallons annually—also raises important questions about the long-term sustainability of groundwater withdrawals in westcentral Minnesota, particularly during drought conditions. Given the proximity of the operation to sensitive watersheds and conservation lands, there is a legitimate concern that nutrient runoff or other environmental impacts could affect nearby ecosystems and wildlife habitat.

In addition to environmental considerations, the scale of the project could alter the character of the local agricultural economy by further concentrating dairy production into very large operations, potentially placing additional pressure on smaller regional farms. Rural residents may also experience quality-of-life impacts associated with increased truck traffic, odors, and other by-products of an industrial-scale livestock facility.

Given the size and potential cumulative impacts of this project, it would be prudent to require a more comprehensive environmental review to ensure that all long-term effects on water resources, ecosystems, and rural communities are carefully evaluated before any expansion moves forward.

I grew up in southwest Minnesota and am a proponent of the agriculture community. I chose a career path as a soil scientist because of my love for agriculture and rural communities. This is not a pro- or anti-agricultural issue when weighing this decision. This is a common sense issue and is a fundamental question of what the future of agriculture could or should be. The proposed expansion of West River Dairy does not align with a long-term vision for a resilient and sustainable agricultural community in west-central Minnesota. Sustainable agriculture depends on systems that distribute opportunities broadly, protect shared natural resources, and support diverse, locally rooted farms. Expanding a single dairy operation to nearly 19,000 cows moves in the opposite direction by concentrating production, environmental risk, and economic power into one large corporate entity.

Rather than strengthening the fabric of rural agriculture, projects of this scale often accelerate consolidation and make it more difficult for smaller and mid-sized family farms to compete or remain

viable. This model reflects the priorities of industrial agriculture and corporate capitalism—maximizing scale and efficiency—rather than building a diversified agricultural landscape that supports farmers, communities, and ecosystems over the long term.

If we are serious about the future of agriculture in Minnesota, we should be investing in systems that promote stewardship of soil and water, strengthen regional food economies, and create opportunities for many farmers rather than concentrating production in a few massive facilities. A project of this scale raises important questions about whether our agricultural development choices are guided by long-term sustainability or by short-term economic gain. At the very least, this project requires an EIS to give local residents a say in what kind of agriculture dominates their community.

Sincerely,

Joe Storlien, PhD

Jennifer Vogt-Erickson **Letter 468**

Dear MPCA,

I am writing in regard to water quality threats that a very large confinement dairy operation would pose to Stevens County.

My connection to the area is that I graduated from the University of Minnesota-Morris in 1998. I was once startled to encounter cows standing in the Pomme de Terre River as I canoed around a bend in the river with a friend. Manure dropping directly in the river is not great, and that was a small herd.

I also grew up on a farm myself and am familiar with many of the issues facing farmers and rural communities. Concentration in agriculture has greatly reduced the number of farms and led to consolidation of schools, hospitals, and businesses in rural areas in my lifetime.

The proposed expansion would be like having 180 conventional dairy farms concentrated in one place, but it's only promising about 40 extra jobs. The potential for a hazardous release of manure would be much greater, and the people hired to work on the farm do not have the same incentive to care for the land, animals and facilities the way that an owner-operator would. Climate change may also make flooding events more severe. All of these factors increase the risk of environmental damage posed by this project.

Because of the elevated environmental risk this project would impose on Stevens County, I ask that Riverview be required to do a full Environmental Impact Statement.

Sincerely,

Jennifer Vogt-Erickson

Sarah Backman **Letter 469**

Hello, as a neighbor in Darnen township, I support this project for the expansion. I do not support overreach by the MPCA or the government, imposing burdensome regulations and expenses that do not support the project's growth. This project is an asset to Stevens County and has support to move forward.

Kurtis Wulf **Letter 470**

To whom it may concern,

I am a neighbor who lives and farms in the area around the West River Dairy. Each interaction that I have had with Riverview has been filled with integrity and a genuine concern for my well being as well as a desire to care for the environment. With this in mind and the extensive permitting process set forth by the state, I support the expansion of the West River Dairy. I welcome more growth in our community! As a local school board member I am excited for the potential to increase our enrollment with this project. I have had a front row seat watching operations of West River Dairy since its inception and have always been impressed with the courtesy of employees and owners alike. Riverview also uses best practices when it comes to manure application, dust suppression and other duties associated with running a dairy farm. I encourage MPCA to approve this permit and allow growth in my community!

Thank you, Kurt

Cory Skaurud **Letter 471**

We have been working with River View for 6 years now. Since the very beginning they have been an outstanding company to be involved with. They are made up of very smart, passionate, and forward thinking people. Their company is always looking at ways to be more efficient and sustainable with their resources. They are willing to change their operations in ways that others wouldn't in order to build their dairies for a sustainable future. All of their locations that I have visited are always in a neat and clean order. Community involvement is a big part of their philosophy, they provide opportunities and economic benefit for surrounding neighbors and communities. If there is anyone you want building more dairies in MN, River View should be at the top of the list. I fully support the West River Expansion. Thank You

Brian Lacey **Letter 472**

Letter of support for Riverview Dairy Expansion

*West River Dairy Expansion

My name is Brian Lacey. My farm is in Lawrence Township/Grant County since the 1960's. My farm location is 7.9 miles from the North Ottawa Dairy. I have been able to watch Riverview Dairy at its Morris, Campbell and North Ottawa Dairies' locations for many years.

From my farm site location where I have been able to see how the dairy is managed. The site is very well maintained and the facility is run in a very professional manner. Truck traffic has been handled responsibly, and local roads are kept in very good condition. As for my wells and drinking water, I haven't noticed any changes. I do have my well tested every so often over the years.

Riverview has maintained open and professional communication with our community and surrounding area.

North Ottawa Dairy plays an important role in the local economy by providing steady employment opportunities. I recognize that Riverview Dairies are a vital part of our community (and area) and that the awareness is reflected in how the facility is maintained and operated. Also, as a local farmer, I do recognize the major impact to my neighbor's local farm commodity sales. With the dairy purchasing my neighbors' crops of shelled corn, silage and alfalfa it is a huge impact because they can keep their crops local. No major shipping cost. The Dairy also helps provide the local farmer with an agronomist, who helps with healthy farming practices to the environment and the local communities.

Based on my experiences as neighbors and farmer, I support the Riverview expansion and believe it will continue to reflect the same level of care and professionalism. The Dairy supports local farmers, jobs, and businesses.

For these reasons, we support the expansion.

Sincerely,

Brian Lacey

Coby Backman **Letter 473**

I am writing this in support of the West River Dairy expansion.

Riverview Dairy has been a positive addition to our agricultural community. From the ability of local farmers to sell their crop to them, to the nutrient rich manure that is then available to be applied to those acres, Riverview has been an excellent partner to work with.

There's been a lot of comments and concerns on ground water contamination. Having worked with Riverview on manure applications, I can tell you first hand that they observe and follow the guidelines set in place by MPCA. Manure is applied in a responsible and conservative fashion. A drive by any one of their sites should be enough to let anyone know that they are responsible stewards of the land. The sites are clean and well kept with no manure running off into the surrounding farm land.

Water usage is another area that I think is being unfairly criticized. Cows drink a lot of water, but, when we compare it to the city of Morris....? Morris, a town of 5000 people, uses 255.5 million gallons of water per year. In comparison, the expansion of 11,000 cows, more than twice the population of Morris (cows also being 7x the size of a human being), will only be using 226 million gallons per year. I find those numbers quite "interesting".

Riverviews commitment to agricultural and community improvement has been phenomenal over the years and I would encourage MPCA to allow this expansion to take place.

Thank you!

Coby

Angela Lofquist **Letter 474**

An operation like this must require care of our environment and the impacts it will have on it. I am voting for requiring and environmental impact statement from this company sharing how they intend to clean and return water to the aquifers they're pulling out of. How is waste being managed properly? And any other environmental issues that come along with such a large operation without natural buffers. I do not support large corporations taking away jobs and land from small farmers and local communities.

Patricia Burns **Letter 475**

I am opposed to this proposed huge dairy feedlot in Stevens County. What are you thinking of having that many cattle along the river? I grew up in Chippewa County and love cows that funded my college tuition.....but this is unhealthy for them and the people who live in Minnesota. Water contamination is never a good thing. This big a herd is not good.

Ann Johnson **Letter 476**

Please require the massive Riverview Dairy project to get an Environmental Impact Statement. I am elderly and will live near this massive project. Riverview would pump up to 226 million gallons/year from an off-site well - they will take our water! And they will generate huge amounts of waste, with unknown groundwater impacts. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement. This will affect my health and my drinking water!

Lisa Moldan **Letter 477**

Livestock Confinement operations in this state already have to submit manure (nutrient) management plans and report and pay water usage. I know this for a fact; I am a hog farmer in Southern Minnesota. (And, I grew up a dairy farmer's daughter milking 60-200 cows in a stanchion barn over the course of my childhood.) There is no environmental reason this dairy cannot expand. And to quote a man speculating that this entity HAS to be polluting based on the sheer amount of manure they handle— is utterly pathetic journalism and a social injustice in itself. Go do your homework. Commercial fertilizer prices are record high. There is no incentive whatsoever for farmers to over-apply manure. Furthermore, it is tested for nutrient value and then applied at precision rates with GPS technology.

In a free market economy, EVERY size of business has a place to exist and offer to consumers a flourishing choice of product—provided each entity can operate at a profit for himself. EVERY size of farm offers a market and competition for local agricultural products—corn, soybeans, alfalfa, oat straw, JOBS, equipment repair, etc. etc. The value to the local economy is incalculable.

Smaller dairies can now enter direct to consumer markets and small scale coops to receive a premium price for their products.

Large scale dairies like this one can meet increasing dairy demand to large scale markets like Costco and Walmart.

Why on Earth would we want to cripple our free market choice with regulation and environmental tax? This state is already one of the WORST STATES of our nation for operating a business—horrifically over regulated and micromanaged by the state with nothing to show for it but billions of dollars of fraud. DO NOT encourage any additional study — what a waste of money. Stop crippling agriculture in this state with bureaucracy.

Use common sense. Allow expansion. Allow the free market to work. A next time, do your homework before you write a piece on confinement ag.

Kim Carswell **Letter 478**

I am writing about this proposed expansion. While I do not live in Stevens County I live in Minnesota and view this plan as an incredible precedent going in the wrong direction. The only benefits I see are for the business. The animals, the land, the neighbors, and the water will not benefit from this. And over time I wonder if the quality of the milk will be found to be compromised by this type of farming.

Kim Carswell

B.S.Dairy Husbandry, Michigan State University 1975

Vanessa Sandoval **Letter 479**

My name is Vanessa Sandoval, and I have lived in the Morris area for almost 14 years. In that time, I've had the opportunity to learn more about Riverview's farms and way of doing business. While I have

always been impressed by how impeccable Riverview's farms are, what has impressed me the most is the company's conscientiousness and focus on taking care of people. Riverview provides good paying jobs in rural communities. Riverview, however, is not exclusively concerned with taking care of its employees. I know that Riverview is an active participant in the communities where it operates, often donating to local charities and causes. Riverview is particularly committed to providing opportunities for the next generation, and that is why I struggle with some of the comments that have been submitted during this comment period. It is my belief that Riverview would not pursue an expansion if it led to environmental degradation that could have a detrimental effect on people's lives. I support the West River Dairy expansion, and I hope they receive the necessary approvals.

Thank you!

Ruth Lindh **Letter 480**

Massive industrial dairy operations are a danger to our environment and our rural economy.

Shari Prigge **Letter 481**

I am opposed to this "unprecedented " request that would allow more pollution into the waterways, land, and surrounding areas of beautiful west central Minnesota. This business also appears to be monopolizing the wellbeing of many of our small farmers. Vote NO!

Nathan Kestner, Minnesota Department of Natural Resources **Letter 482**

Dear Charles Peterson,

Thank you for the opportunity to review the West River Dairy Expansion Environmental Assessment Worksheet (EAW). The Minnesota Department of Natural Resources (MN DNR) has reviewed the EAW and offers the following comments related to water appropriation and permitting.

Water appropriation permitting

MN DNR is currently reviewing groundwater appropriation permit application 2025-1502 for 226 million gallons per year (MGY) at a proposed maximum pumping rate of 1000 gallons per minute (gpm) for the West River Dairy Expansion. Please note permit 2025-1502, using well unique well number (UN#) 740629, would (if approved) replace and modify permit 2008-0230.

Water has never been appropriated from the UN# 740629 associated with permit 2008-0230 (proposed to be used for permit 2025-1502). Groundwater availability is moderate to limited in this area. As identified in permit 2008-0230, the groundwater appropriation from this well can directly impact the river and is subject to existing permit conditions based on the river flow.

MN DNR is completing a re-evaluation of stream flow in the Pomme de Terre River. We expect to include permit conditions based on stream flow. Conditions will be modified from those currently included with 2008-0230, which may include restrictions on the ability to appropriate water during summer months. Additionally, we will evaluate the impacts of water appropriation on rare features in the Pomme de Terre River downstream of the appropriation site.

The EAW did not consider impacts from the potential groundwater appropriation at UN#740629 on the Pomme de Terre River in section 12.B.4. Surface Waters. Our review of the aquifer test completed on UN# 740629 suggests that the water table aquifer is strongly connected to the Pomme de Terre River. The long-term average flow in the Pomme de Terre River is likely to be reduced by the average pumping rate of UN #740629. If water appropriation permit 2025-1502 is authorized, permit conditions, including

restrictions on pumping when streamflow is below 10% of the median monthly base flow, are anticipated. Conditions to maintain baseflow will be considered to protect ecology, public health, and the needs of downstream users of higher priority.

The current West River Dairy operation relies on two groundwater appropriation permits associated with the operation:

- **Permit 2004-1023: 95 MGY for livestock watering from four wells located near the current dairy operation. This permit includes groundwater-level monitoring conditions.**
- **Permit 2009-0492: 21.3 MGY for livestock watering and 64.4 MGY for agricultural irrigation from one well located in the proposed expansion project area. This permit may need to be amended to reflect changes in land use.**

The EAW does not describe how the existing permitted wells, particularly the one located on the proposed expansion site (2009-0492), will be integrated with the new facility. If the permit holder requests to increase the volume of permits 2004-1023 or 2009-0492, aquifer testing may be required to ensure sustainable water use.

The EAW indicates in section 12.B.3.d that the wells for the existing facility and the off-site well are located in separate aquifers. The shallow and deep aquifers in this area are part of one connected system, and water availability from these aquifers is limited. The proposed water sources do not constitute a diversified groundwater source approach. Due to the aquifer connections, cumulative existing and proposed water appropriation will be considered during water appropriation permitting.

MN DNR has also received and is reviewing a Dam Safety Permit application, 2026-0133, associated with the water storage ponds identified in item 9 of the EAW. This permit application was received on January 29, 2026.

Sincerely,

Nathan Kestner

Regional Manager, Ecological and Water Resources

Madeline Neenan — Letter 483

Hello,

As a farmer and community member, I am very concerned about the number of gigantic animal operations in our region. The "concentration" aspect of these industrial actors means that they simply cannot spread their manure on enough acres to manage, and if they get close it will mean huge amounts of wear and tear on our roads as heavy trucks filled with manure drive over them. Additionally, it is not clear that in the event of a mass mortality event, the business has access to necessary levels of carcass disposal. This feedlot is already dangerously large, so any additional expansion would put the surrounding community at risk. Further, we do not know what risks this type of operation poses to groundwater.

This expansion requires an EIS by any common sense metric, and the law should be change to make such an assessment automatic when any permit of this size is requested.

Madeline Neenan

Red Wing

Matthew Green **Letter 484**

Hello, I would like to express my support for the West River Expansion. I lived 3 miles from the West River Dairy for 10 years At the age of 18 out of high school and love for farming. Riverview gave me an opportunity for employment for 8 years which in turn gave me the tools and training to start my own farm. They are great people who care about the community and give small farmers like myself a chance to succeed.

Lisa Rogers **Letter 485**

I vote No! It's too big. Please pay attention to other huge feed lots across our country and the negative impact they have on the environment and the people who live nearby. Thank you.

Marcella Bode **Letter 486**

I'm not in favor of expanding the dairy. The effects on the environment would be horrible and the treatment of the animals would be disrespectful. Please do not approve.

Courtney Swenson **Letter 487**

The site is too close to the Pomme de Terre River, the river would likely be polluted by run-off and could alter ecosystem. I vote no to expansion due to proximity to river and risk of pollution.

Nancy Carpenter **Letter 488**

I am a former resident of Morris, MN and oppose this expansion on the grounds that it is 1) unnecessary (except to increase the profits of Riverview Dairy), 2) directly harmful to family dairy farms, and 3) an environmental insult in terms of enormous water use and production of astronomical amounts of manure. The promise of growth (more jobs) in west central MN is miniscule due to the highly automated operations Riverview uses and certainly does not outweigh the harm to the natural prairie ecosystem. The "need" for more dairy could and should be met by greater support for our family farms, which are considerably less harmful to the environment. An environmental impact statement for such a gross expansion should be required for any operations this large, at minimum. Irregardless of Riverview's past performance, their desire to be considerate and responsible neighbors cannot compensate for a massive environmental impact.

Edie Thiel **Letter 489**

My name is Edie Thiel. On March 10, 2026, I submitted a comment regarding the Riverview expansion project near Morris, MN. When I submitted my comment, I did not have all of the information to make an informed opinion; therefore, the data and information within my opinion comment is not accurate, and I would like my comment removed from the record.

Susan Frenzel **Letter 490**

The manure containment system for this expansion is sufficient "except in conditions of weather extremes." Today's March 18, 2026, Star Tribune weather report by Paul Douglas states: "Welcome to the United States of Weather Extremes."

Even before the dairy expands, it's a reality and a given that the manure containment systems will fail, because they aren't built for weather extremes, and weather extremes are a fact of life now.

I'm 72, and in my lifetime, MN lakes and rivers have gone from being swimmable and fishable to being covered with blue-green algae from overflow of fertilizer from fields and animal factory farms. That's the case from ice out in spring to the freeze in winter. There aren't a few weeks of good swimming anymore in summer.

The MPCA has already allowed the quality of life in Minnesota to be destroyed in favor of profits for animal factory farms. We Minnesotans paid too high a price for thirty cents off a package of meat or a gallon of milk. We lost what makes Minnesota great in our lifetime.

Future generations will be rolling in shit. Thanks a lot, MPCA! You knew what you were doing.

You were not doing your job for the state of Minnesota. And you did a number on us in favor of animal factory farms.

Is your mandate to promote industry over livability?

How about the poor neighbors to the dairy? Can they breathe freely? Can they sell their land for the same amount of money as they would have gotten before the dairy first expanded? What will their land be worth after the expansion?

What's the water table like around the dairy? A.I. data centers will draw down the water table statewide. How about that aquifer under us from the Gulf of Mexico to the Canadian border? Is it drawn down beyond use yet? What do we do when the aquifer is gone, or polluted?

What good is the MPCA to the people of Minnesota?

I hope you'll do your jobs to the best of your ability and disallow an expansion of this animal factory.

Shoppers prefer milk humanely produced. When calves are given cow's blood to drink instead of cow's milk, that's not humane.

Milk produced by cows that are housed skin to skin in dark barns in conditions conducive to turning bird flu or any disease spread among them into an extremely powerful pathogen, endangering human life, we don't want that. You shouldn't either. You are supposed to be protecting us, not pushing the limits of what corporations can get away with, to the detriment of our environment and health.

It's not ok for you to expand West River Dairy. If you approve it anyway, to the detriment of Minnesota, make the dairy ship the manure to farms in other states, instead of dumping it all on this county and this state. How many tons? The animal factory system generates 5 tons of manure per year for every man, woman and child in the U.S.

Susan Frenzel **Letter 491**

The statement on your website above this comment line on March 17, 2026, stated that the manure containment systems for the expansion are sufficient except in the case of extreme storm events.

We are living with global warming, which is rapidly making weather events more extreme and more frequent. There will be an increasing number of extreme storm events. We're seeing them already, year-round. It is no longer possible to swim in most MN waterways due to blue-green algae caused by feces runoff from MN land. It just takes a few flooding events per year to spread feces into waterways.

How will they protect the water table and aquifers from pollution from a 19,000-cow feedlot?

How will they keep the air clean and fresh for the neighbors?

How will they dispose of the manure on an ongoing daily basis in a way that won't burden the county with fecal waste?

Right now, more than 5 tons of animal waste annually is generated for every man, woman and child in the U.S. per Dr. Michael Greger in his 2020 book, "How to Survive a Pandemic."

And even though the MPCA's only concern is pollution, the State has a strong health interest in preventing another pandemic, and businesses have a strong financial interest in preventing another pandemic.

And cow milk isn't even that healthy, due to the pregnancy hormones in it. A huge Swedish nutritional study of tens of thousands of people over decades found that people who drank a cup of milk per day die at a higher rate than those who don't. You can Google it and find it.

Do your job for the people of Minnesota. You don't exist only for the corporations of Minnesota to make a killing off destroying our state.

We don't want to trade fresh air, clean water, swimmable and fishable rivers and lakes, and our health for thirty cents off a carton of milk or off a pound of meat.

Our environment is already destroyed under your oversight. Please don't make it even worse.

Tom Mahoney **Letter 492**

I am concerned about the true environmental impact of the proposed expansion and would like the MPCA to require a full Environmental Impact Statement before the project can go forward.

A project of this scope demands careful and exacting review of cumulative impacts, including existing animal units of all operations within the county and watershed, the increased demand on area water resources with potential threats to existing wells, the additional reduction in regional air quality and the increased threat to protected wildlife and environmental resources located nearby.

I believe the unprecedented scope of this project demands an unprecedented examination of its potential impact.

Mary Nesgoda **Letter 493**

I would like to understand the reason for Riverview LLC desire to put another feedlot in Minnesota. Do they need more money to offset the 11MM judgement in Arizona? Minnesota doesn't need another feedlot. Especially from a company with multiple safety issues. Additionally, before a decision is made an EIS is needed, to determine the effect on nearby protected waterfowl and wildlife production areas.

Susan Frenzel **Letter 494**

If MPCA okays this expansion of the feedlot for the dairy, how will you safeguard the drinking water from nitrates? A.I. says: "Stevens County, like many areas in Minnesota, may face issues with nitrate contamination in groundwater, primarily due to agricultural activities and other human-made sources. Elevated nitrate levels can pose health risks, particularly to infants." and

"Nitrate levels in Stevens County's drinking water have been reported to exceed the Environmental Working Group's health guideline by significant amounts, with some tests showing levels 12 to 31 times above the guideline of 0.14 parts per million. This indicates a serious concern for water quality in the area."

Nitrate pollution in the drinking water is already a problem in Stevens County. Don't make it worse by approving this feedlot expansion.

Air pollution? Water pollution? Pollution of the land from excessive manure?

Please don't degrade our environment even more by doubling the size of the dairy.

Please protect the quality of life of the people of Minnesota. That is your reason to exist. Please honor it.

Corporations must find ways to be profitable without destroying our quality of life. You need to guarantee us a decent quality of life, and the quality of life for the people living within a 10 mile radius of that dairy has been severely degraded.

You are the check on environmental destruction. Please veto this expansion. There is nothing the dairy can do to sufficiently mitigate its danger to the environment b/c it has no protection against extreme weather events, and those are becoming more common and frequent every day.

Michelle Burns **Letter 495**

Minnesota doesn't need another feedlot. Especially from a company with multiple safety issues. Do they need more money to offset the 11MM judgement in Arizona? Additionally, before a decision is made an EIS is needed, to determine the effect on nearby protected waterfowl and wildlife production areas. I am firmly opposed to Riverview LLP feedlot expansion in Minnesota, especially in such a sensitive ecosystem.

Hein Enslin **Letter 496**

My name is Hein Enslin, and I've lived in Stevens County for over five years. As someone who lives near the existing West River Dairy, I take a strong interest in how water resources are managed in our area. Water availability matters not only for agriculture, but also for households like mine, local wells, and the long-term health of the community.

After reviewing the available information, I'm encouraged by the level of thought that has gone into this project. The plans clearly reflect a responsible approach to water use, including conservation-focused practices, monitoring systems, and operational measures aimed at using water efficiently and only as needed.

What gives me additional confidence is Minnesota's strict water use permitting and reporting requirements. Projects of this scale are held to high standards, and ongoing monitoring of groundwater levels and usage provides important safeguards. These layers of oversight help ensure that water use remains sustainable and that both the farm and surrounding community are protected.

Overall, I believe this expansion demonstrates a strong balance between agricultural growth and long-term water stewardship. I support the project and am confident that local water resources can continue to be managed responsibly as it moves forward.

Thank you.

Lisa Notsch **Letter 497**

After having read an article in the Chokio Review, I am appalled at the fact that this expansion wasn't brought to anyone's attention sooner. I also find it ridiculous that this expansion doesn't even require an environmental impact study done, with all the manure this business produces and the runoff etc., it shouldn't be in question that this study should be MANDATORY!!! I also heard that they claim all the

manure will be stored on site... If they consider stored on site to mean in fields such as the one next to our property, then I know that means they will locate a giant pile of manure right in the path of someone's place. Every time that they pile it right to the south of our place the strong south wind we always have during the summer blows that manure dust and debris right to our place. We end up breathing it all in and I also hate to think how it contaminates our garden produce. You can't tell me that's healthy for us or our pets. Also, where is all this water they use for their operation coming from? You can't tell me that excessive water use isn't going to affect the water table for everyone else in the nearby area. I also believe that we should be protecting our natural beauty and resources and there is a wildlife protection area and the Pomme De Terre watershed near that area etc. This shouldn't even be something you feel you can entertain in the slightest. I don't want anyone else having to through the same headaches we've had to go through either. In other words, I'm highly against this expansion.

Alan Nikolai **Letter 498**

This needs an full industrial scale environmental review as it is industrial in size. Clearly 25k+ cattle is a huge sanitation risk. As such, the risk needs a full industrial scale review.

Dustin Walsh **Letter 499**

My name is Dustin Walsh, and I farm in Swift County MN. I grow corn, soybeans, sugar beets and alfalfa, and our family has worked with Riverview for over 20 years.

I receive manure from the dairy as part of my nutrient management plan. Before any application, my fields are soil tested and manure is applied at agronomic rates following state guidelines. From my experience, this is a structured and responsible process.

Manure has improved my soil health, increased organic matter, and reduced my need for commercial fertilizer. The dairy also provides a reliable local market for crops like silage and alfalfa. That partnership supports the long-term sustainability of my farm.

I understand this expansion is being reviewed through the state's environmental process. Based on my firsthand experience working within those rules, I am confident the project can continue to operate responsibly.

I support approval of the West River Dairy expansion.

Respectfully,

Dustin Walsh

Marcia Schroeder **Letter 500**

I live within 5 miles of West River Dairy. I believe that both Riverview and West River are run responsibly with an eye to preserving our environment. However, an expansion of the proposed magnitude requires substantial more environmental resources than are already being used. I favor an environmental impact study. More than doubling the number of cows on a site should not be a default decision by the PCA. Because River View/West River is a responsible company, I think the owners would want to initiate a study to reassure residents like me that the hazardous issues and over taxed resources would be addressed.

Carol Dines **Letter 501**

I am writing to express my shock over the size of the proposed dairy in Morris, and to urge the MPCA to turn down their license to expand. Factory farming pollutes our water systems, and despite extensive storage systems, leaks are inevitable. A dairy of this size will use too much water an inevitably contaminate our air. This kind of factory farm is part of what drives climate change. Moreover, it is the kind of farm that can create a bio-hazard. What if some kind of virus takes hold, and that many cows have to be euthanized. It's a tragedy waiting to happen. Milk is consumed less now, partly because of consumers' concerns about large dairy farms. Why should we risk polluting our land and air to export our milk to other countries? That's what this expansion is about. Please do not allow this dairy to expand. It will only set a new precedent for other dairies around the state who are in competition. We need to fight climate change in all ways, including in our food production systems. Lastly, I'm an animal rights advocate and I can only imagine the kind of lives those cows live, locked inside large barns, their bodies given antibiotics to avoid viruses, milked until they're no longer useful, and then discarded. It's a moral failure in our country.

Thank you,

Carol Dines

Heidi Peters **Letter 502**

I strongly urge the agency to conduct an EIS on this proposed expansion before making a decision for the health of Minnesota's lands, its waters, its people, and its animals that would be at and around this site. Thank you for your consideration and the work that you do to protect our state's amazing resources for this and future generations!

Charles Martelle **Letter 503**

My mother owns acreage in synnes township that a watershed runs through. This land has been rotated between crops and crp since my grandfather purchased the property. Our family believes in conservation, sustainable agriculture, and keeping up good relations with adjoining landowners. I believe if river view moves in and starts using excessive amounts of water and creates unsustainable sewage issues it may negativity effect our land, the wildlife that thrives there, and the small farmers that depend on the land for their income. I have seen a drastic habitat loss in the last decade in this area. Wildlife that was once abundant in a large range is now confined to small pockets of habitat. Our farms are one of those small pockets. I would hate to see a large scale dairy operation ruin any more habitat that is already in such short supply.

Thank you for taking the time to hear my thoughts.

Charlie Martelle

Susan Frenzel **Letter 504**

I submitted this comment on 3/20/26 and you deleted it. I'm resubmitting it.

The MPCA deleted the comment I made on Tuesday, 3/17/26, so, outraged, I followed up with more comments on 3/18 & 3/19. But what I have to say shouldn't be muzzled because it applies to the dangers to Minnesotans of animal/poultry factory farm practices. They have a direct bearing on this expansion request.

And the MPCA is the government bureau with the oversight to regulate animal and poultry factory farms. So take my comment. And act to protect Minnesotans.

I note that the head of the MPCA when the MN public was just discovering 3M's PFAs pollution came to the MPCA from 3M. So perhaps the current leadership at MPCA is from the corporate animal factory farm sector, and they're in a position to try to hide from us the dangers they actually pose to us.

NYT best-selling nutrition expert, Dr. Michael Greger, started out as an epidemiologist. One of the world's leading epidemiologists is Dr. Michael Osterholm, at the University of Minnesota.

In 2020, Dr. Michael Greger published, "How to Survive a Pandemic," about the next pandemic, possibly as soon as within 5 years, that might be a bird flu pandemic, that he predicted would probably be generated in an animal/poultry factory farm. He went in detail in the book about why viruses and bacteria become extremely lethal when generated in a system where the hosts are packed body to body, in dark, airless enclosures. Yes, dark, airless enclosures, packed body to body, causes weight to be put on fastest for poultry, cutting meat production time in half.

Greger told us calves are weaned on cow blood, which is protein nutritious, rather than on milk, which farmers can sell. Cattle (beef and dairy?) are fed chicken manure, which doesn't affect the taste of the meat of the cattle butchered for meat. Cattle are fed highly subsidized corn and soybeans which causes e coli to be produced in their stomachs, and the e coli endangers the consumer when he eats hamburger.

The reason this is relevant to MPCA, pollution control, is that you are the government bureau that can green light or limit animal and poultry factory farms.

Stink, smell and shit aren't the only things you should be paying attention to. The likelihood of animal factory farms generating pandemics is in your wheelhouse, too, within your responsibity.

Dr. Michael Osterholm published a book in December 2025 called, "The Big One," about the upcoming pandemic which might take 1/3 of mankind's lives.

I couldn't bear to finish Dr. Greger's book or to get past a few chapters of Dr. Osterholm's book.

I advise you to talk with Dr. Michael Greger and to Dr. Michael Osterholm about how animal/poultry factory farms can be modified to minimize their generation of pandemics.

As a living being, I ask you to make the factory farms you regulate act humanely toward their living products.

Jacob Strege **Letter 505**

I am against this in all ways. We are driving small farms out of the state. Nobody can compete with these coperations. The environmental impact is terrible and disgusting. The possibility of contamination of the water shed which would destroy how many peoples lives. This cannot happen.

Thank you

Jake

Sharon Kutter **Letter 506**

I strongly urge you to dismiss any plans to proceed with the proposal to dramatically increase the size of the Riverview LLP dairy operation near Morris MN which would be more than 60 times the size of the average Minnesota dairy. Problems with these massive dairy operations center around water and manure. They also drive out smaller family-run dairies which have smaller environmental and community impacts. Giant dairy operations require massive amounts of water and water is our most valuable resource. We must put laws in place to protect the water. Manure in these mega dairies is

collected and diluted into a concentrated liquid sludge that has to be stored or spread on nearby fields which can destroy the soil, water and air.

We used to have a dairy farm but could not stay in operation due to the takeover by mega farms. The mega agriculture industry in nothing but greed and monopoly. They destroy our water, land, air quality, economy and communities. How much have these industries paid to political election campaigns to buy votes that serve their interests? These actions are criminal and should be treated as such.

Again, I strongly urge you to dismiss any plans to proceed with the proposal to dramatically increase the size of the Riverview LLP dairy operation near Morris MN. Do your job.

Karen Renaud **Letter 507**

This proposed operation is the first of its size in Minnesota. It would be nearly double the size of the next largest livestock operation in our state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities. The Minnesota Pollution Control Agency must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview, LLP must be required to undergo a full Environmental Impact Statement (EIS).

An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. According to the documents filed by Riverview, the proposed operation would require:

1. To supply water for the operation the facility would be allowed to pump 226 million gallons from an off-site well per year.

2. Liquid manure storage encompassing 250 million gallons of waste.

3. 13,200 acres of farmland for manure application.

Riverview has a recent history of a manure spill in western Minnesota. In Arizona, the company agreed to pay $11 million to residents affected by the dairy's over-pumping. The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review

Just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process. An EIS must be requied for this project.

Thank You,

Karen Renaud

Boone Carlson **Letter 508**

To the Minnesota Pollution Control Agency,

My name is Boone Carlson, and I serve as Chairman of the North Ottawa Township Board. I'm also a neighboring farmer to the North Ottawa Dairy, operated by Riverview Dairy. I'm writing in support of the proposed West River Dairy Expansion.

Riverview Dairy has been an excellent neighbor and community partner. They maintain their facilities and surrounding farms to a very high standard—everything is kept clean, orderly, and well-managed. The company communicates regularly with the township about road conditions, and they've been proactive in offering help with gravel and maintenance.

On a personal note, they've even assisted me on a few occasions with equipment and manpower for small projects around my farm, which I sincerely appreciate. Their willingness to cooperate and contribute extends beyond operations—they've also established a Dollars for Scholars scholarship for local students, showing real investment in the next generation of our community.

Based on my experience as a township official and a neighboring farmer, I believe Riverview Dairy's expansion will continue to support local agriculture, uphold high environmental standards, and provide benefits to both the township and the broader region.

I respectfully encourage the MPCA to approve the West River Dairy Expansion.

Sincerely,

Boone Carlson

Chairman, North Ottawa Township Board

Tanner Zych **Letter 509**

03-14-2026

West River Dairy Expansion

There should be a Thorough Environmental Impact Statement (EIS) done on this project. This will have an obvious impact on that tract of land and the surrounding community for generations to come. There should be extensive considerations for all corresponding impacts this potential expansion could have on the ground and surface water, air quality, safety concerns for the surrounding community. We have a degrading infrastructure this wont help with that.

We don't need any more corporate farms especially for an industry that isn't needed to be expanded. The Dairy industry is a highly subsidized industry due to the Money Worshipping Corporations that have continually taken advantage of the loopholes and the backing of the federal government to bail them out every time its needed. The time to wake up was 25 years ago I'm afraid.

I've attached with this letter an article that will help explain my prior paragraph.

I hope you make the right decision in this matter.

God Bless and Have a Great Day.

Thanks

Dixie Houser **Letter 510**

To: MPCA

Re: Riverview Proposal - WEST RIVER DAIRY EXPANSION-CAFO Proposal

From: Dixie Houser

Riverview is proposing to pump 226 million gal. of water a year- almost as much as 5,000 people of Morris, that's not counting the numbers of private rural wells probably effected by their proposal. We also know as a fact, they are already in lawsuits for pumping MORE than their application allowed in other states. Their proposal is well above the environmental capacity load.

Waterfowl protected areas are not only important for local economy but is important for migrating fowl on a global scale. It is also representative of the "canary in the coal mines". (what happens to the lower food chain happens to us) These NEED protecting for our own protection. MPCA's mission statement commits to "Protect and IMPROVE the environment and ENHANCES human health by monitoring environmental quality, planning for climate change and ENFORCING regulations to PREVENT (not just monitor) pollution of air, land and water. " Animal numbers has the effect of increasing climate change and Minnesota's climate is one of the fastest changing climates in the nation already.

Riverview has past and current problems in other states of not completing a truly transparent EIS (Environmental Impact Statement). Considering their breaking the conditions of their accepted applications in other states and their current lawsuits; residents from other states are warning Minnesotans.

This creates a monopoly of a mega company that threatens and creates the loss of family farms and local rural economy; causing damages that they try to mitigate by paying out fines and offering jobs. This does not solve environmental problems people will continue to suffer. You do NOT have to live in the area or the Minnesota River watershed to be affected by pollution of groundwater and the aquifer. Aquifers run much further than most people realize, affecting more people than just those who live near by.

I ask you, I plead with you to take seriously your mission and be proactive and not just reactive AFTER the damage is done. We do not want another Water Gremlin type problem that is far reaching.

Thank you,

Dixie Houser

Heather Prunty **Letter 511**

As a biologist, fisherman, and an avid hunter, I strongly oppose this expansion. Large scale dairy farms and feedlots are notorious for contaminating downstream water bodies on a large scale, as well as leaching into the groundwater. This is a much larger footprint than the original plans anticipate. These giant corporations have no problems paying fines, and the problem does not get fixed. Instead, signs are posted warning of the contamination and people can no longer recreate and/or consume fish and waterfowl from the contaminated water bodies.

As an individual, I have friends who own small Minnesota dairy farms. It is their livelihood and has been for generations. Minnesota has already effectively eliminated many small farming operations and, unless their goal is to add small dairy operations to the list, this must not be allowed to happen.

Choose lifelong Minnesotans over Big Ag.

Monica Ledesma **Letter 512**

My name is Monica, and I have been living in Hancock for the past seven years. I live close to Riverview Dairies and have had the opportunity to observe their commitment to operating responsibly within the community. Based on what I have seen, I support the proposed expansion of the dairy farm.

Riverview has demonstrated strong standards when it comes to site cleanliness, organization, and overall management. I have also seen their efforts toward environmental protection and maintaining a well-kept operation, which is important for those of us who live nearby.

In addition to these practices, this expansion would bring positive benefits such as job opportunities, economic growth, and continued support for the local agricultural industry. For these reasons, I believe this project is a positive step forward for our community.

Charles Koehl **Letter 513**

To whom it may concern, my name is Charlie, and I have been in Horton Township for 20 years. I live within 6 miles of West River Dairy.

I have had numerous interactions with the West River Dairy Farm, and so far, they have all been positive. It is a well-supported fact throughout the nearby community that Riverview is a highly professional and community/environmentally conscious organization. The manure from the dairy has made an immensely positive impact on the soil health and erosion control in our region. The crop feeds the cows, and the cows feed the crops through manure; it's a simple yet regenerative system.

I understand the concern some may have regarding this expansion; however, I believe West River Dairy has, and will continue to hold environmental sustainability in the highest priority. Based on my observations from previous Riverview expansion projects, this WRD expansion is likely to bolster the rural community and provide environmentally sustainable solutions for future generations.

I approve the West River Dairy expansion.

Sincerely, Charlie

Connie Maier **Letter 514**

I am writing this in support of Riverview Dairy and the expansion. I grew up in the area and still go out there quite often. Riverview takes great care in their operations. My dad's farm is approximately 3 miles from the expansion site. When we go out there we never smell the barns. They also take great care of their workers. The city of Morris has had a lot of new housing that the company has built. Riverview also does a lot of giving back to the community which many times is unnoticed. I have only heard great things about Riverview.

Rachel McGill **Letter 515**

The West River Dairy Expansion is of a scale that obviously probably impacts its surroundings in a significant way. It is a no-brainer that the environmental impact needs to be understood thoroughly here. Please do so.

Evangeline Moen **Letter 516**

CUI Bono? [Who Benefits] Who is the beneficiary of this project? It is obvious that all harm and risk remains in the community where the project is proposeed.

There is no legitimate reason to allow this size expansion when there are other scale levels of dairy production in the region. Overwhelm is never a good strategy. Profit for known (and possibly not known) actors make the case for short term decisions, but the long term degradation of the region will not be compensated for when the profits have been removed from the region.

Theresa Harsma **Letter 517**

I am opposed to the huge West Dairy expansion in Steven's county in MN. Riverview has a history of waste spills and the resulting environmental damage. A full environmental impact study must be completed before this is approved. These corporate CAFO's pollute waterways, groundwater, and wells. Small and medium size farms go out of business. Small towns and their economies suffer.

Merrilee Stahler **Letter518**

I am a land owner in Syness township where the proposed expansion of Riverview Dairy is to take place. My concerns include excessive stress and possible near depletion of the Pomme de Terre watershed, the volume of liquid manure and the magnitude of land required to offload it as well as the impact this expansion will have on neighboring land owners whether they are farming or renting their property.

The impact on wildlife and the wetlands that define this area would be disastrous. Both of these naturally occurring environmental factors have already been diminished over the years due to farming practices. Not that many years ago this township was rich in a natural habitat that fostered the continued migration of huge numbers of waterfowl as well as protective habitat for deer and other land animals. Today the elimination of this natural habitat has created major problems for wildlife including changes in migration patterns. The opportunity and desire to hunt for food which is a prominent cultural practice in this part of the country that has been handed down through generations is already threatened by farming methods. Riverview expansion would put additional stresses on this fragile connection between people and their environment.

As a land owner I also anticipate the negative impact this expansion would have on the land value of property in the township. A return to the land held by many young people would be discouraged by neighboring fields of manure and the constant threat that one day their wells would run dry and they would be unable to water their own livestock and themselves.

Heather Nord **Letter 519**

... I grew up on the Pomme de Terre river bottom, south of Morris. My father taught Sociology and my grandfather worked for US Fish & Wildlife, so I understand water quality issues. And as you well know, this is not just a Morris area issue. Large and small farmers along the Pomme de Terre – PDT river valley have moved fence lines away from the river, but decades later, there are still issues with high levels of bacteria in the PDT. So the problems are more complex than just moving fence lines. From what I understand, field tiles are buried 18" under topsoil, drain into ditches and then directly into river systems. Toxic manure pit slurry (also from other animal and bird facilities) is sprayed on fields or injected 8 inches under the topsoil. Current manure handling should be re-considered in all your decisions, statewide. My point, large factory facilities create heavier impact on water quality and wildlife; profits should NOT be the only consideration. What controls will you put on these open sewer lines to prevent it ending up in ground water or in the Mississippi River ? Sincerely, Heather Nord

Roger Hippe **Letter 520**

This is getting way out of hand. Put a stop to this nonsense! There is absolutely no need for this excess.

Stef Kirschbaum **Letter 521**

I wholeheartedly oppose this facility. It is not good for the animals, for the land, for the other small farms across the state. I do not live near here, but I feel for any neighbors near the current facility of such massive size.

Mechelle Sazama **Letter 522**

I vote no on this expansion. As a small farmer myself I feel strongly that mega farms do more harm than good.

Rebecca Heinz **Letter 523**

As a dairy farmer in Minnesota and a farmer advocate please stop Riverview and affilates from further expansion. The expansion is creating a monopoly in the dairy industry pushing many family farms out of business due to the high volume of milk they flood the market with. Competition in the industry is good but not at the rate at which Riverview is accelerating. Riverview is not considering the impact they have on Minnesota's dairy industry and they are not helping local economies by what they are doing. As a small farm family we buy local, sell local, hire local, and support local.

Riverview fills all of their needs "in house" and finds the cheapest suppliers not necessarily supporting local communities or even Minnesota. Please stop Riverview from further expansion in Minnesota or there will be a monopoly and more unforseen consequences to Minnesota's dairy industry. Thank you for your consideration.

Zachariah Grein **Letter 524**

Large dairy farms need to be treated like industrial factories not farms. Furthermore the dairy herd should be spread over many owners and many locations to minimize the liability of food security and environmental impact.

Thank You

Zachariah Grein

Mark Brakke **Letter 525**

Simply based on the huge size of this project and its negative impact on smaller dairy operations I strongly object to this project being approved. We need to keep more Minnesotans active in our farm community. We do not want to turn over all food production to large businesses.

The size of this proposed dairy operation is such that a detailed environmental assessment is essential.

Ben Lilliston, Institute for Agriculture and Trade Policy **Letter 526**

The Institute for Agriculture and Trade Policy thanks the Minnesota Pollution Control Agency for the opportunity to submit the attached comment on the proposed West Dairy Expansion. IATP believes that the proposed project should undergo a full Environmental Impact Statement (EIS). The expansion would make the dairy the largest in the state, by far. It is critical that we fully understand how the proposed project effects the environment, climate change, and the state's dairy farmers.

Baldomero Penaloza **Letter 527**

My name is Baldomero Penaloza. I am writing to express my support for the proposed expansion at West River Dairy. I have lived in Stevens County for five years, and my family and I live near one of

Riverview's farms. As a neighbor, I have seen how Riverview takes care of the roads and the environment. They keep the roads clean, especially during the harvest season. In the summer, they also work to dust on gravel roads controlled. Riverview is a responsible business and runs good operations. They have been good neighbors to me and a positive presence in the community. I am confident Riverview will continue to operate the West River Dairy expansion as they do with their current farms.

I support this project and encourage its approval.

Thank you!

Josh Betcher **Letter 528**

I support this project because Minnesota needs farms of all sizes. The existing laws have more than enough protections to ensure that the impact of the density of this proposed operation is a non relevant detail. This organization has shown the history and responsibility to properly manage all of the infrastructure to keep this size of operation conforming to all requirements and regulations.

Juan Mendoza **Letter 529**

My name is Juan Mendoza. I am writing to support the proposed expansion at West River Dairy. I am a certified animal waste technician with over ten years of experience, including helping Riverview apply manure on fields around Stevens County. Riverview takes manure application very seriously. They use modern equipment, including technology that allows them to remotely monitor application equipment. They also conduct regular equipment inspections to make sure it's working properly and there aren't issues in the field. Riverview also prioritizes safety. These can be dangerous and stressful situations, but Riverview does the right thing to protect people and the fields. I also want to say that manure application has a lot of rules in Minnesota. We have to follow application rates, setbacks, nutrient management plans, and wait for the right time and conditions to apply. I know Riverview does this responsibly and they are always looking for ways to improve.

Thank you and all have a great day

Greg Shirley **Letter 530**

We don't need more mega dairy farms. They hurt our rural communities. They don't buy local, they make it harder for small farmers to compete and they damage the environment. Where does all that methane and manure end up? Plus they use massive amounts fertilizer and other chemicals to grow the feed for these cattle.

We need to have smaller farms using regenerative ag to get our farm ecology back in balance. This expansion will cause massive amounts of damage instead.

Kurt Schulz **Letter 531**

Rural Minnesota has been ravaged enough by industrial scale agriculture, especially dairy. It has driven out small family farms, is an environmental risk, a biological threat and is responsible for the depopulation of rural towns , schools and hospitals.

Enough. This should be a resounding NO !

Sally Summer **Letter 532**

MPCA

Riverview LLP is proposing to expand in Steven's county. (West River Dairy Expansion) I am a land owner 15 miles away from this CAFO.

It is important to study the impact of this expansion and requires an EIS.

We who own land know that pollution from these CAFO are impacting our ground water, our land health ,our communities. The Pomme de Terre River watershed is within25 miles from its confluence with the Mn River for example. Plus the Minnesota Department of Natural Resources does not have a complete map of Steven's County groundwater resources and aquifers.

Accountability is the job of MPCA. Do not allow this expansion based on unknowns.

EIS needs to be completed before expansion.

Sincerely

Sally Summer

Adam Zeltwanger **Letter 533**

I am in favor of West River Dairy expansion.

Riverview follows the state rules on Manure management.

Soil sampling required before manure application

Nutrient Management Plans reviewed at the state level

Manure managed at agronomic rates

Stewardship practices that protect soil and water

Long-term soil health improvements from manure use

Thanks,

Adam Zeltwanger

Scott Ruiter **Letter 534**

My name is Scott Ruiter and I live and farm in Chippewa County Minnesota. I also live two miles from Riverviews Louriston Dairy site. My families experience with them has been nothing but positive.

We raise corn, edible beans, sugar beets and alfalfa on our farm. Riverview has given our farm many increased opportunities in working with them on forages and manure for our crop health. All manure is applied within state guidelines and in a safe manner. Our partnership with Riverview supports the long-term sustainability of our family farm. I support the West River expansion.

Mason Metzger **Letter 535**

I am in full support of the expansion!

I live one mile west of the original Riverview site, and 6 miles from the new expansion. I feel if anyone would have a reason to complain about smell, water drawdown, to much traffic or whatever excuse people might have, it would be me. Riverview has been nothing but great for my family and my small business!

I have watch Riverview grow since I was a kid, I have watched their customer relations get better with time. I have watched them use natural resources in a positive way as to not affect the environment

around these sites. I have watch them keep a community, which was slowly shrinking, stabilize it, to now have growth in a small town, where all other rural towns are dying. Not here!

To not let this project go through would be a major blow to this small town, no matter what other people might think. From my experience when people have negative things to say, it is usually because of lack of information.

I feel as though me being this close to Riverview my whole life gives my opinion more weight than someone that lives far away from here, with know actual interaction with Riverview.

Again I am in full support of this project!

Thank you!

-Mason

Lyle Grimm **Letter 536**

I am writing in support of the proposed West River Dairy expansion. As an employee at Riverview for the past 19 years, I have seen firsthand the importance of strong, responsible agricultural operations in sustaining rural communities. I was raised on a dairy farm, and although my family is no longer milking cows, I remain deeply connected to the industry. I am grateful to be part of a farm that prioritizes animal care, environmental stewardship, and long-term sustainability.

West River Dairy represents the kind of operation that helps keep rural economies alive. It provides stable jobs, supports local businesses, and contributes to the vitality of small communities like ours. Just as importantly, it plays a role in producing safe, high-quality dairy and beef products for people who rely on farmers to feed them. Many people in towns and cities do not have the ability to grow their own food, and operations like this ensure a reliable food supply while maintaining responsible environmental practices. In addition, manure from dairy operations provides a valuable source of organic nutrients for crops, helping improve soil health.

I live approximately one-half mile from the Riverview dairy farm and about seven miles from West River Dairy. In my experience, I only notice manure odors a few times per year, typically during application periods, which is expected in a rural area where livestock and crop production are part of everyday life.

I am also thankful for the long-term working relationship with the Minnesota Pollution Control Agency. Through this partnership, we continue to uphold regulations and implement practices that protect and enhance the environment and improve soil health. This collaboration helps ensure that agriculture can remain both productive and responsible for future generations.

I appreciate the opportunity to share my perspective and strongly support the continued growth of West River Dairy.

Raymond Walters **Letter 537**

Great to see western MN expansions that add jobs and value for this area.

Rhonda Wellnitz **Letter 538**

Hi i would like to say that i am in support of the expansion. We have worked with the company for many years. They are great people and very supportive of the community and the people that work for them!

Kaleb Pugsley **Letter 539**

It is clear in the EAW, that the project uses modern systems and standard environmental safeguards. Larger operations manage manure and water more effectively because they can invest in better infrastructure. This expansion benefits local communities, agriculture sustainability and consumers need for more dairy. Based on the information provided, I support continuing through the regular permitting process.

Javier Torillo **Letter 540**

My name is Javier Torillo, and I worked at West River approximately three years ago. I am writing to express my support for the expansion of this company.

In my experience, West River is an excellent organization that provides many employment opportunities and promotes cultural learning. It also encourages important values such as water conservation, animal welfare—especially the care of dairy cows—and the protection of the natural environment.

During my time there, I observed a positive and respectful work environment. For these reasons, I would like to continue supporting the growth of the dairy industry and the development of agriculture in this area.

I fully support the proposed expansion.

Thank you for your time and consideration.

Sincerely,

Javier Torillo

Sergio Vazquez **Letter 541**

I am writing in support of the proposed expansion of West River Dairy. As an employee, I have first-hand experience with the daily operations and environmental practices implemented at the facility, and I believe the project reflects a strong commitment to responsible and sustainable agriculture. I had beed working 21 year with Riverview

Through my work, I actively participate in programs designed to ensure the most efficient use of water. We closely monitor water consumption on a daily basis, including tracking usage per cow, and continuously look for ways to improve efficiency. The water used for the expansion will come from a previously vetted and permitted source, and the total appropriation has already been proposed to be reduced significantly. Additionally, the construction of water storage basins will serve as both a contingency and a climate-resiliency measure, further strengthening responsible water management.

Environmental stewardship is a core part of our operations. Employees are trained and continuously educated on best practices, including preventing manure spills and protecting surrounding land and water resources. We have systems in place to ensure manure is properly managed, not only onsite but also beneficially reused as an organic fertilizer for surrounding farmland. This reduces reliance on synthetic fertilizers and helps improve soil health. We also recycle manure solids for use as comfortable bedding for the cows, demonstrating a full-cycle approach to resource management.

Animal care is another top priority. The cows are treated with respect and provided with excellent living conditions, including proper ventilation systems that keep them cooler in the summer—often up to 10 degrees lower—and protected during winter from extreme cold and freezing temperatures. Healthy animals are essential, as they are the foundation of our work and livelihood.

I can also personally speak to the quality of life near the dairy. I lived for four years less than a mile from the facility, where my children grew up. Odors were rare and only noticeable on limited occasions, and beyond one to two miles, it is nearly impossible to detect any smell. The lagoons are properly covered, and fly control measures are effective, maintaining a clean and controlled environment.

West River Dairy also values its employees and community. The company treats its workforce with respect, fosters strong relationships with vendors, and actively seeks to collaborate with local businesses and individuals. There is an ongoing effort to involve the local community and provide opportunities for those interested in the dairy industry, especially local residents.

The operation is supported by trained professionals in every area, including dedicated teams that monitor water use and ensure full compliance with all permitting requirements. Every regulation is followed carefully, and decisions are guided by data, science, and a commitment to continuous improvement.

Based on my experience, I strongly support this expansion. It represents not only economic growth, but also a responsible and forward-thinking approach to agriculture that prioritizes environmental protection, animal welfare, and community engagement.

Sincerely,

Sergio Vazquez

Sandra Simonson **Letter 542**

In order for Minnesota to have strong rural communities, we need to preserve the beneficial economic impact of small and medium sized family farms. The approval of such an extreme large-scale operation such as the West River Dairy expansion only serves a single corporate interest not the economic and environmental well-being of rural communities.

Environmental protection needs to be a top concern, especially for an operation that would be the largest scale operation in Minnesota if approved. The requirement of an EIS is the responsible action needed to be taken by the MPCA and to not do so would be an extreme disservice to Minnesota residents. All of the previous operations previously determined to need an EIS were significantly smaller than West River's proposed operation.

The protection of water is a key concern in Minnesota! A corporate interest with a poor environmental record should not be allowed to pollute such an important resource. It is gravely irresponsible to other water users and residents of the area to move forward with this permit process without a full understanding of the potential impacts, especially in a sensitive watershed.

I submit these comments as a life-long resident of Minnesota who grew up on a farm. Since an ecology course taken in 1982, I have understood the importance of water as a resource. The two well renown ecology professors who taught the course implored us to be diligent about the protection of Minnesota's water. These professors correctly predicted the future attempted misuse of Minnesota's valuable resource - water.

Matt Wellnitz **Letter 543**

I am writing this letter in support of the West River Dairy Expansion. Having worked on the processing side of the dairy industry for over 20 years, I have had the opportunity to observe a wide range of operations, and it has truly been a pleasure to see how well Riverview manages and maintains its large-scale facilities.

From my experience, it is clear that the reason Riverview continues to grow and succeed is rooted in its commitment to doing things the right way. They consistently meet—and often exceed—all regulatory requirements, demonstrating a strong dedication to compliance, environmental stewardship, and animal care. Their success is not the result of cutting corners, but rather of maintaining high standards across every aspect of their operations.

In addition to their operational excellence, Riverview is also a strong and active supporter of the communities in which they operate. Their investment goes beyond their facilities, as they contribute to local economies, support community initiatives, and build meaningful relationships with those around them.

Based on my professional experience and firsthand observations, I fully support the West River Dairy Expansion and believe it will continue to reflect the high standards and positive community impact that Riverview is known for.

Esteban Marino Hernandez Lopez **Letter 544**

As a employee, I would like to give my support for the expansion of West River Dairy, it is fundamental for my self and for many of us is we have the opportunity to get a permit for this expansion. I truly believe that these will continue helping to us like employees and also like the community, this means a bigger source of employment and many other opportunities. With the pass of years Riverview has generated a lot experience in all the practices that the site applies day to day. I really believe that Riverview will not going to create a problem that affected to the community, neighbors or his own employees. Also I would like to mentioned at some point not just I'm part of this like Riverview, also we are part of these community.

Justin Steiner **Letter 545**

I personally know, and have worked with Riverview, and they operate with a high level of integrity and attention to detailand care a lot about the environment. Their facilities are second to none when it comes to cleanliness. They operate at a very professional level. I fully support the expansion of West River dairy because this group has proven to go above and beyond in many ways and so I have no problem with this expansion.

Thank you for your consideration in this matter!

Perry Aasness, Midwest Council on Agriculture **Letter 546**

Dear Commissioner Kessler and MPCA Staff,

On behalf of the Midwest Council on Agriculture, we respectfully submit this letter in support of Riverview LLP’s proposed dairy expansion at West River Dairy near Morris, Minnesota.

The Midwest Council on Agriculture represents agricultural producers, agribusinesses, ag lenders and commodity groups across the region who are committed to responsible stewardship of natural resources, strong rural economies, and a safe, reliable food supply. From our perspective, modern livestock producers like Riverview exemplify how environmental protection and agricultural growth can and do advance together.

Today's dairy producers operate in a vastly different landscape than previous generations. Investments in advanced nutrient management, manure handling technologies, precision feeding, and data monitoring allow modern dairies to reduce environmental impacts while improving efficiency. Riverview

has consistently demonstrated a commitment to operating within rigorous environmental standards and regulatory oversight, reflecting the broader evolution of the livestock sector toward sustainability, transparency, and continuous improvement.

Dairy expansions that undergo thorough environmental review, as this project has, reflect confidence in both science-based regulation and the ability of modern producers to meet or exceed those standards. When well-designed and properly regulated, dairy facilities protect water quality, improve soil health through responsible nutrient recycling, and contribute to long-term environmental outcomes.

Equally important is Riverview's long-standing approach to working closely with local communities and neighboring farmers. Large livestock operations do not exist in isolation; they are integrated into local economies and landscapes. Riverview's model emphasizes collaboration by creating opportunities for neighboring farmers through manure application partnerships, supporting local service providers, and contributing to employment and economic stability in Stevens County and the surrounding region.

Successful agricultural operations depend on trust, communication, and accountability. Riverview's engagement with neighbors, local leaders, and community stakeholders reflects an understanding that strong relationships are essential to long-term success. These partnerships help ensure that growth in agriculture also means growth in shared prosperity.

Finally, the expansion of responsible dairy operations is critical to meeting growing demand for dairy products—both domestically and globally. Minnesota plays a key role in supplying high-quality, safe, and nutritious dairy foods, and continued investment in the state's dairy sector helps ensure that production remains close to the consumers and communities it serves.

Supporting sustainable growth in dairy production also helps maintain Minnesota's leadership in agriculture, preserves valuable farming infrastructure, and provides opportunities for future generations to remain engaged in agriculture rather than seeing production shift elsewhere.

For these reasons, the Midwest Council on Agriculture supports Riverview LLP's proposed dairy expansion and respectfully encourages the Minnesota Pollution Control Agency to consider the demonstrated environmental safeguards, community engagement, and economic benefits associated with this project.

We appreciate the MPCA's commitment to a robust public process and science-based decision-making and thank you for the opportunity to provide comment.

Sincerely,

Perry Aasness, President

Midwest Council on Agriculture

Mark Tuls **Letter 547**

Dear Mr. Peterson,

My name is Mark Tuls, and I have over 20 years of experience in the dairy industry, including more than nine years as a proud employee of Riverview. I am writing in strong support of Riverview's proposed West River Dairy expansion in Stevens County.

Riverview has given me the opportunity to continue my journey as a fourth-generation dairy farmer, honoring what my family came to America to do — help feed millions of people. This work is not just a career for me; it is a legacy and a responsibility that Riverview has empowered me to carry forward.

Through my two decades of experience in the dairy industry, I understand the importance of a strong and stable livestock sector to Minnesota's rural economy. Operations like Riverview generate consistent economic activity, support local jobs, and drive investment that allows surrounding businesses and communities to thrive.

The proposed West River Dairy expansion represents a meaningful economic benefit to the region. It will create demand for local vendors, support construction and long-term employment, and contribute to the continued vitality of rural communities that depend on agriculture.

From my direct experience, Riverview is a professional and responsible operation that truly puts employees first. The company offers very competitive wages, invests heavily in its people, and maintains its facilities with a level of care that exceeds how many people maintain their own homes.

Animal care is a top priority, and Riverview's standards consistently exceed industry expectations.

Projects like this are essential to maintaining a competitive and sustainable agricultural economy in Minnesota. Continued investment ensures that local families can remain employed close to home and that agriculture remains a strong foundation of our state's economy.

Given the rigor and sufficiency of Minnesota's existing environmental review process, no Environmental Impact Statement is needed for this project. I respectfully encourage your support and approval of the West River Dairy expansion.

Thank you for your time and consideration.

Sincerely,

Mark Tuls

Rachel Zeltwanger **Letter 548**

I fully support West River Dairy expansion. I lived in Stevens County for 50+ years and around Riverview sites my entire life. The livestock facilities are always kept clean and held to the highest environmental standards.

Again, I am in support of West River Dairy expansion

Rachel Zeltwanger

Lafe Grimm **Letter 549**

ATTN: Charles Peterson

My name is Lafe Grimm and my wife and I have a family farm in neighboring Horton township, Stevens County. I am writing in support of the proposed **West River Dairy Expansion**.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

I am also a cattle farmer and understand that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship. It is very apparent that they run their business with a long-term mind set and don’t take short cuts.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports longterm agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. I have found them to be excellent neighbors. Their positive impact to our local farm economy is huge and one that our local farm families desperately need.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Lafe Grimm

Juan Manuel Palomo Posada **Letter 550**

I am in favor of the expansion of the West River dairy. As an employee at Riverview who has been working for 8 years in the dairy operations, the application of manure is an activity that is carried out following the manure management standards required always keeping in mind that work with integrity, responsibility, respect, and safety improves the conditions of our community. I support continuing through the regular permitting process. Thank you.

Michael Steffl Steffl Drilling & Pump Inc **Letter 551**

My name is Michael J Steffl. I am the owner/operator and an employee of Steffl Drilling & Pump Inc. We provide what nothing living can survive without WATER. We serve multiple agricultural operations in Minnesota, North Dakota, South Dakota, Iowa, and Wisconsin. I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

We need operations like Riverview's consistent economic activity that supports local jobs and allows businesses like ours to grow and reinvest in our communities.

This proposed expansion represents a meaningful economic benefit to the region. Its supports the long-term employment and vitality of rural communities.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates and beyond.

Projects like this are essential to maintaining a competitive and sustainable rural economy. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability in rural Minnesota and beyond.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project

Sincerely,

Michael J Steffl

Ty Feuchtenberger **Letter 552**

Dear Mr. Peterson,

My name is Ty Feuchtenberger, and I am a local farmer, business owner, and resident of Stevens County. I am writing to express my support for the proposed West River Dairy Expansion.

Through my experience and familiarity with agricultural operations in this area, I have observed Riverview Dairy to be a professional and well-managed operation with a strong commitment to environmental responsibility. Their facilities are consistently orderly and well maintained, and their management approach reflects an emphasis on doing things properly and transparently.

Manure management and water usage are among the most highly regulated aspects of agriculture in Minnesota. Riverview has demonstrated a clear understanding of these requirements and works within established guidelines through detailed nutrient management plans, routine soil testing, proper application rates, and careful consideration of timing and field conditions. From what I have seen, their approach goes beyond simple compliance and reflects a genuine focus on responsible stewardship.

Utilizing manure as a fertilizer source provides important benefits to local farms, including improved soil structure, increased organic matter, and reduced erosion. These practices contribute to long-term soil health and support the sustainability of agriculture in our region.

Riverview has also played an important role in the local community by supporting neighboring farmers, providing employment opportunities, helping maintain infrastructure, and contributing to schools and community initiatives. Their ongoing communication with neighbors and officials demonstrates a sincere desire to operate as a responsible and respectful neighbor.

I understand the proposed expansion is currently undergoing environmental review through Minnesota's established regulatory process, which provides thorough oversight. Based on Riverview's operational history, available information, and the protections already in place, I am confident this project can move forward responsibly. I believe the existing review process is sufficient and that an Environmental Impact Statement is unnecessary.

Thank you for considering my comments. I respectfully urge the agency to approve the West River Dairy Expansion, which supports local agriculture, strengthens rural communities, and reflects sound environmental stewardship.

Sincerely,

Ty Feuchtenberger

Christe Singleton **Letter 553**

It is vital that the Riverview Dairy be REQUIRED to submit an environmental impact statement. It is nearly twice as big as any current operation in the state, and its environmental harm would be enormous.

Riverview would pump up to 226 million gallons/year from an off-site well, nearly as much as the entire City of Morris (which is permitted for 300 million gallons/year for 5,000+ residents). This is a massive water use project.

The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure. This is a huge waste output.

There are unknown groundwater impacts: the DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped, making it risky to permit large withdrawals now.

Sensitive, already impaired waters: the expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters-the Pomme de Terre River and a nearby unnamed creek are already listed as impaired. The addition to the existing farm would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a FULL Environmental Impact Statement.

Thank you,

Christe Singleton

Guillermo Cruz Arroyo — Letter 554

I really want this project to start because of the greatness it can bring to the community.

Mary Arroyo — Letter 555

I want this project to open up because it will bring opportunities to the community.

Megan Wulf — Letter 556

ATTN: Charles Peterson

My name is Megan Wulf, and I am a local farmer in Steven's County. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Megan Wulf

Scott Hennen **Letter 557**

I support the expansion of West River Dairy. Through out my years of farming in synnes township I have seen what it was before West River Dairy was there to what it is today as it has evolved. They have brought value added market options to our farming region to which we would not have otherwise. As a neighbor to Riverview I have worked with them through all the tasks associated with the dairy from selling silage, working on the silage harvest crews, and receiving fertilizer from the dairy. In my pesonal experiences with Riverview, safety is of their top priority whether it be personal or environmental. As a neighbor and a farmer please support Riverview West River Dairy expansion!!

Rigoberto Cruz **Letter 558**

I have worked for nearly 11 years across Riverview's various systems and operations, and I have observed the benefits that new projects—or expansions of existing ones—bring to the communities.

I believe in Riverview's deep commitment to doing things the right way; I am in favor of the expansion of West River Dairy.

Max Feuchtenberger **Letter 559**

ATTN: Charles Peterson

My name is Max Feuchtenberger, and I am an employee of Riverview LLP, past local business owner and involved in other agricultural operations in Stevens County, Minnesota. I am writing in support of Riverviews proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview’s create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From my direct experience as an employee and vender, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Max Feuchtenberger

Fredy Flores Avila **Letter 560**

My name is Fredy Flores Avila, and I am writing to express my support for the proposed West River Dairy Expansion in Stevens County.

I have worked with Riverview for over 15 years, and my support for this project comes from direct, firsthand experience. I have seen how operations like this function on a daily basis, and I understand the level of care, structure, and oversight involved.

This expansion represents a meaningful opportunity for our local economy. Many families depend on agricultural operations like this for stable employment. It is not only a source of jobs for current workers, but also for neighbors and for the children of local families, who return each year to work. These opportunities help young people gain work experience and support themselves while staying connected to their community.

Riverview is not just a job. It is a way of life for many families in this area. It provides stability, routine, and long-term opportunities that are essential in rural communities where economic options can be limited.

Based on my experience, the animals are treated with dignity, respect, and compassion. They are kept in well-managed, protected, and regulated environments, with consistent attention to their health and well-being. This is something I have personally witnessed over many years.

I also understand that environmental concerns are part of this process. However, modern agricultural operations like this operate under strict regulations and oversight. Expanding an existing facility allows for better use of established infrastructure and management systems, which can be more responsible than building new operations elsewhere.

I encourage decision-makers to carefully consider both the economic importance of this project and the realities of how these operations are managed. Based on my experience, I support moving this project forward.

Thank you for the opportunity to provide input.

Sincerely,

Fredy Flores Avila

Craigan Wulf **Letter 561**

As a neighbor of a Riverview location, I can testify the quality in standards and practice used in the daily operations and all year long is top notch. The areas are all kept clean and all runoff is contained. The odor is so minimal its hardly noticeable most days.

As a farmer working along side Riverview, the benefits of us working together are so important. To be able to help eachother as they have needs of crops for feed production and land for manure application. We have countless opportunities for selling crop, adding Alfalfa crop to our rotation, and options for helping in harvest to offset equipment costs.

Personally I would have no concerns with an expansion for Westriver Dairy and I fully support the proposal.

Thank you,

Craigan Wulf

Gail Hockert **Lettte 562**

I am opposed to West River Dairy Expansion. I am very concerned about the ramifications to the ground water in our area and hope it is not allowed to expand.

Thank you,

Gail Hockert

Scott Wulf **Letter 563**

As a neighbor of West River Dariy and a home owner by the well (400' from my front door)that is to provide the water for the sight expansion I would like to share a few comments.

-In resent years I've been involved in the instalation of Riverviews manure application infrastructure, there was much planning on how to keep the manure from reaching any streams/rivers if they would happen to have a spill.

-The location of the well that they plan to use is in an area where the aquifer is continously being replenished.

-With the integrity I've seen with the people Riverview, if there use of water would affect my personal use of water they would welcome a call and be willing to come up with a solution to fix any issue that might arise.(If you look at Riverviews history in Arizona, you will find they are one of the leaders in water conservation in the state. Also there willingness to help ther neighbors with water.)

I would have no concern with Riverviews plan to expand there dairy operations. I would also echo the neighbors that commented on all the benefits of having Riverview in our local economy.

Thanks MPCA for giving us a opportunity to share our comments with you.

Sincerely,

Scott A. Wulf

Conrad Spangler **Letter 564**

My name is Conrad Spangler and I have been working with Riverview for the last 14 years. My entire life has been spent in the dairy industry. I grew up on a dairy farm, studied dairy science, practiced dairy medicine, and have been active in the dairy community for my entire life. I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

Riverview has an unparalleled culture of caring for people, communities, cattle, and the environment. The economic activity created by their dairies supports a variety of vendors, both locally and nationally, local businesses such as grocery stores, hardware stores, accountants, lawyers, and medical professionals. Additionally, all of this economic activity brings benefits and students to the local schools.

Riverview has consistently been a good steward of the environment.

• Every year they contract a pest company to ensure that mice and rodents are not present around their facilities.

• They actively incorporate proven methods to decrease fly populations.

• They cover lagoons to reduce greenhouse gases and odors from manure.

• They closely monitor water usage to ensure responsible use of resources.

Riverview cattle facilities undergo comprehensive audits twice per year to evaluate all aspects of dairy management. Routinely the auditors comment on the cleanliness of the facilities, the high level of management observed, and the excellent culture that Riverview and its employees have created. I have no doubt that the proposed expansion will be managed at a similarly high level as Riverview has done in the past.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Conrad Spangler

Matt Komro, Komro Sales & Service Inc. **Letter 565**

ATTN: Charles Peterson

My name is Matt Komro, and I am the Owner and President of Komro Sales & Service Inc. , a contractor, Ag. design, and service company, serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Matt Komro

Lucas Koehl **Letter 566**

ATTN: Charles Peterson

My name is Lucas Koehl, and I am a neighbor, local resident and farmer in Darnen Township in Stevens County. Our farm and my family's house is located directly between Riverview's West River Dairy and

Riverview Dairy and less than 1 mile from the Pomme de Terre River. I am writing in support of the proposed **West River Dairy Expansion.**

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As a farmer that utilizes manure on our own farm and works with Riverview to responsibly field apply their manure, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

Based on my experience permitting wells on our own farm, I have complete confidence that the well permitting process in Minnesota protects our water resources. I have also had my own residential well water tested in the last few years, and the nitrate levels - (.03 mg/L) are far below MPCA's safe drinking water standard of 10 mg/L. Riverview's dairies have been operating in the neighborhood for 20 -30 years and there has been livestock production here for generations.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. Farmers today put a tremendous value on manure as a resource, utilizing it at agronomically sound rates, displacing commercial fertilizer that they would otherwise purchase to produce their crops. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers (my family operates a business harvesting feed and field applying manure for Riverview), creating jobs, (I am a former employee) maintaining roads, (like the one in front of my house) and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

I feel like there have been many comments on this project from those who do not understand modern agricultural practices and lack appreciation for the permitting process that is in place. Many that are in agriculture today (including Riverview) have earned to be where they are through responsible stewardship of our natural resources.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Thank you for the opportunity to comment on this important project.

Sincerely,

Lucas Koehl

Felix Camacho **Letter 567**

Riverview made me a better person, and I appreciate the opportunity to learn from this country. I love my job!

Carlos Portillo **Letter 568**

Riverview is an excellent company in which it provides a culture of opportunities in which it takes care of the well-being of each person in the same way it is treated with great respect and a strong ethics in the care of cows I am very happy to be part of this great company

Maggie Knobloch **Letter 569**

My name is Maggie Knobloch, and I am writing to express my support for the proposed West River Dairy Expansion.

I have been connected to Riverview for all of my life. My father as well as several of my family members have been involved in our company for quite some time now. I have been working at Riverview for approximately two years. During that time, I have had the opportunity to work across multiple areas of the company, including dairy operations, livestock, and other segments of the business.

Through this hands-on experience, I have developed a deep appreciation for the culture at Riverview. Our people are committed, supportive, and take pride in their work getting to produce food for Americans. Riverview is also 75% employee-owned, which reflects their strong commitment to investing in its people and creating meaningful opportunities for growth.

From an operational and environmental standpoint, I have personally observed Riverview's practices across many of its sites. Our company maintains high standards in how it treats its cattle. Cleanliness, care for animals, and attention to detail are consistently emphasized.

Riverview also demonstrates a responsible and sustainable approach to manure management. We partner with local growers, creating a cycle where crops are grown, fed to cattle, and nutrients are returned to the land through manure application. This system supports both agricultural productivity and environmental stewardship. Additionally, our company operates in compliance with all applicable regulations and is attentive to its impact on neighbors, roads, and surrounding communities.

Based on my experience, I believe Riverview operates responsibly and with a strong commitment to environmental care and compliance.

For these reasons, I fully and respectfully support the approval of the West River Dairy Expansion. I also believe that the current Environmental Assessment Worksheet process has been thorough and sufficient with all of the research, and that an Environmental Impact Statement is not at all necessary.

Thank you for the opportunity to provide comment.

Sincerely,

Maggie Knobloch

Ashdon Hacker **Letter 570**

I am writing in support of the proposed West River Dairy expansion. As a college student, I have had the opportunity to work at Riverview during my summers, and I am incredibly grateful for the experiences and support the company has provided me throughout my college journey.

I grew up living next to the dairy, and throughout that time, I rarely noticed any impact from it in my day-to-day life. Instead, I have seen firsthand how much it contributes to the community and how positive of an influence it has been. Riverview has also been very good to my family, providing opportunities and support that we truly appreciate.

Riverview has given me more than just a summer job—it has allowed me to return home, stay connected to my community, and continue building valuable skills while pursuing my education. The flexibility and opportunities provided have made a meaningful difference in helping me balance work and school.

One of the most impactful parts of my experience has been the relationships I have built. The people I work with are supportive, hardworking, and genuinely care about one another. These connections have made my time at Riverview not only enjoyable but also personally rewarding, and they are a big reason I look forward to returning each summer.

I am thankful for everything Riverview has provided me and strongly support the continued growth of West River Dairy. It is an organization that supports both its employees and the communities it serves.

Halle Grimm **Letter 571**

My name is Halle Grimm, and I am writing to express my support for the proposed West River Dairy Expansion.

Riverview was my first job at 14, where I worked in a front desk position. That experience opened up many opportunities for me and helped me grow both personally and professionally.

Riverview has continued to support me as I prepare to go off to college this fall through their scholarship program, which benefits around 55 high school seniors with $3,000 that I plan to use towards my academics.. This commitment to supporting young people and investing in the future of the community is something I have personally experienced and value deeply.

From my experience, Riverview operates in compliance with all regulations and is thoughtful in how it manages environmental responsibilities, including considerations related to land, roads, and the surrounding community. I believe Riverview is responsible and committed to environmental care, and I trust that this expansion will be handled with the same level of attention and integrity.

For these reasons, I respectfully support the approval of the West River Dairy Expansion. Thank you for the opportunity to provide comment

Thank you,

Halle

Jonathan Tomic **Letter 572**

Had the opportunity to tour a bunch of their facilities, was blown away by how clean, creative, and environmentally conscious they were! They don't let a thing go to waste and are very committed to providing a sustainable future for generations to come! I fully support the expansion of the West River dairy!

Alejandro Díaz Flores **Letter 573**

Buenas tardes, tengo 5 años trabajando para Riverview y es una empresa de compromiso, grandes valores y oportunidades.

Es una empresa que trabaja con mucha seguridad, responsabilidad y mucho compromise Yo estoy a favor de la expansion

Translation:

Good afternoon. I've been working at Riverview for five years, and it's a company that's committed to its values and offers great opportunities.

It is a company that operates with a strong sense of security, responsibility, and commitment I am in favor of the expansion

Hunter Massner **Letter 574**

My name is Hunter Massner. I am a resident of Stevens County and am writing this in **support** of the West River Dairy expansion. I also believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

I am a local business owner and expanding the West River Dairy would be a benefit to my business and almost all of the local business owners. As a home appliance and heating and cooling business, Riverview is a large part of our sales. An expansion means more laborers, more job opportunities, and increased cash flow in our community. The expansion would mean opportunities for business directly related to Riverview and others that are not connected at all.

An expansion to the West River Dairy would increase the amount of local revenue. This expansion positively affects much more than Riverview and the local farmers. Each employee and contractor of West River has a need to purchase things to live, therefore increasing local business profits. Everyone needs to buy groceries. Everyone needs appliances. Everyone needs a car, gas, clothes, water, electricity, a home, furniture, appliances, and tools.The list goes on and on. Most importantly services from the repair man, the carpenter, the electrician, and many other businesses that rely on Riverview for a large portion of their business.

In conclusion, the West River Dairy expansion would be great for the local business and the residents of Stevens County. **We fully support** the expansion of West River Dairy.

Thank you,

Hunter Massner

Mary Margaret Lawler **Letter 575**

The way we treat our animals is a reflection of who we are as human beings. There is no possible way to humanely treat 18,000 cows. This is wrong. According to the Animal Humane Society, one of the rights of animals is the freedom to express normal behavior. You will be violating this right if you allow this expansion. Please do not allow this expansion.

Janice Nelson **Letter 576**

I am very, very concerned about this proposed immense dairy that is being proposed to be located near Morris, Mn. The damage to the environment, including wildlife and waterfowl areas would be extreme and irreversible! The amount of water required would affect the water table in the area and the effects on the Pomme de Terre water shed must be very carefully considered. Environmental effects must be very thoroughly checked and considered!! Also, the effect on small to midsized dairy farms would be unfair and damaging! Please be careful of irreversible outcomes of this decision! Thanks for your consideration. Jan Nelson

Brandon Thesing **Letter 577**

Good morning, my name is Brandon Thesing, and I serve as a Corporate Account Manager for Select Sires Member Cooperative, working directly with Riverview. As an organization and myself we fully support Riverview Dairy's proposal to develop and permit this new facility. Riverview has built a strong reputation for progressive dairy management, with a clear focus on doing things the right way—taking great care of their animals, growing responsibly, and always looking for ways to improve. Their team puts a lot of emphasis on cow comfort, health, and performance, using good data, strong facilities, and well-trained people who understand that animal care is at the core of everything they do. This project is not just about growth, but about continuing to move the industry forward in a responsible and sustainable way.

Brett Petersen **Letter 578**

My name is Brett Petersen, and I am a Neighbor and farmer of Riverview in Louriston Twp, Chippewa County MN. I am writing in support of the proposed West River Dairy Expansion.

For many years my family has worked with Riverview dairy, Riverview Dairy operates with professionalism, integrity and environmental responsibility. All their dairies are clean, organized and are committed to doing things the right way every time.

As someone that lives and breathes agriculture every day in Minnesota, I recognize the importance of water management and manure management in Minnesota. Riverview has always strived to exceed the states regulations and go above and beyond with all operations. This is accomplished by nutrient management planning, soil testing and proper application rates. I would not work with a company if I did not believe they were not the best at these items in the state of Minnesota.

The use of manure as a fertilizer source has had huge benefits to my farming operation and local operators. This is seen through soil health, crop health and supports long term agricultural sustainability.

Riverview has also been a strong community partner supporting local farmers, creating local jobs, investing in schools and local programs. I know personally Riverview has donated multiple times to local groups and organizations in the Kerkhoven and Murdock areas.

I understand that this project is undergoing environmental review through the state's established process one of the most rigorous in the region. Based on what I can see Riverview has exceeded all environmental standards the state has set for them to meet and believe that no additional regulatory burdens are necessary on Minnesota businesses.

I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities and reflects responsible approach to environmental stewardship. I believe that an EIS is not necessary.

Sincerely,

Brett Petersen

Dustin Hollermann **Letter 579**

ATTN: Charles Peterson

My name is Dustin Hollermann, and I am writing in support of the proposed West River Dairy Expansion. I have worked at Riverview for nine years in Dairy Genetics and Reproduction, and prior to that spent four years as a vendor working with the company. With over 25 years in the dairy industry, I have seen a lot of operations — and Riverview stands apart.

Riverview is simply the best in the world when it comes to animal husbandry. The care, attention, and standards applied to their cattle are unmatched in my experience. But what truly sets Riverview apart is the opportunity it creates for its people. It is a place where employees can build real careers and grow in ways that are hard to find anywhere else.

I also live very close to one of Riverview's existing sites, and I can say from personal experience that odor, traffic, and noise are a complete non-issue — barely noticeable. The concerns some raise simply do not reflect the reality of living near one of their operations.

I have four kids, and projects like this expansion give me confidence that they will have the opportunity to be part of this incredible organization someday. For that reason and many others, I fully support the West River Dairy Expansion.

Thank you for the opportunity to provide comment.

Sincerely,

Dustin Hollermann

Dawn Kisgen **Letter 580**

I support the expansion at West River Dairy.

Catherine Anderson **Letter 581**

To Whom It May Concern:

I just read an article regarding a proposed major increase in size of a dairy farm operation near Morris. It is my opinion that this should be adamantly opposed due to environmental concerns, especially excess water consumption and contamination. Aren't all humans dependent on clean water for our very survival and, therefore, shouldn't we be good stewards of its balanced care?

Sincerely,

Catherine Anderson

Ali Bouta **Letter 582**

ATTN: Charles Peterson

My name is Ali Bouta and I am a local resident, farm owner/operator and local community agricultural loan officer in both Kerkhoven and Dublin Townships of Swift County. I am writing in support of the proposed **West River Dairy Expansion**.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Ali Bouta

Bravera Bank - Ag Banking Officer/Dairy Farmer

Kyle Clark — Letter 583

ATTN: Charles Peterson

My name is Kyle Clark, and I am a lifelong resident of Swift County in addition to owner/operator of Clark Family Farm Partnership in Dublin Township of Swift County. I am writing in support of the proposed **West River Dairy Expansion**.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely, Kyle Clark

Justin Cronen **Letter 584**

c/o Charles Peterson

I am writing to provide my support for the proposed West River Dairy Expansion outlined in the draft Environmental Assessment Worksheet (EAW) currently under public review.

Riverview, LLP has demonstrated a long-standing commitment to responsible agricultural development, regulatory compliance, and environmental stewardship. Their facilities are known for incorporating modern technologies aimed at protecting water quality, managing manure responsibly, and supporting sustainable production practices. Based on Riverview's operational track record and their adherence to state and federal oversight, I am confident that the proposed expansion can be implemented responsibly and with appropriate environmental safeguards.

The expansion also represents significant economic value for rural Stevens County and the surrounding region. Large-scale dairy operations like West River Dairy contribute to local employment, increase demand for local goods and services, and help support the long-term vitality of rural communities. Riverview has historically been a strong partner to the communities in which they operate, and this project is a continuation of that commitment.

For these reasons, I support Riverview LLP's proposed West River Dairy expansion and believe the project merits favorable consideration as it advances through the environmental review and permitting processes. Thank you for the opportunity to comment.

Sincerely,

Justin Cronen

Emily Ann Raeker **Letter 585**

Please do an EIS before hand. There is a lot at stake here.

Im not as elegantly voiced as some individuals but please hear my voice as well.

We live nearby and are concerned about many things involved woth this project.

The amount of water they want to take is almost as much as the city of Morris! That's frightening, especially for people that live off wells around this area. Not to mention the wildlife in the area.

There is also too much land they want to destroy that is a habitat for many water fowl in the area. That would be devastating.

The smell would also be terrible.

I dont trust that they would abide by everything they are saying they would.. in other locations of theirs they have already over pumped and polluted the land.

It also won't supply that many more jobs at all.

My main concern is the auquafir, the pollution and the loss of habitat.

Please enforce a thorough investigation. I know this won't stop it yet but we need to start somewhere.

Thank you

Jeff Kisgen **Letter 586**

I support the West River Dairy expansion!

Charles Steffl, Step Saver Inc **Letter 587**

ATTN: Charles Peterson

My name is Charles Steffl, and I am the owner/operator/employee of Step Saver Inc, a Water Softener Salt delivery service serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Charles Steffl. President Step Saver Inc.

Debra Hacker **Letter 588**

ATTN: Charles Peterson

We are Charles and Debra Hacker. We are residents of Stevens County. We are writing in support of the proposed West River Dairy Expansion.

Based on our experience and observations, Riverview operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and they are committed to doing things the appropriate way.

As Seniors born and raised in Stevens County, we are well aware of all the regulations that have occurred over time when it comes to manure management and water which are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what we have seen first hand, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with the community reflects their commitment to being a good neighbor.

We understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in our area — and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, we are confident this project can continue to operate responsibly. We believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, we respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. We also believe that an EIS is not necessary.

Sincerely, Charles and Debra Hacker

Dave Lemke **Letter 589**

Having been a small family dairy farmer and still helping daily on family dairies I am strongly against the expansion of the large dairy Cafos. Water usage and manure application problems are without a doubt some of the more troubling aspects of these operations. Also there is currently an oversupply of milk that is driving prices down to all dairy farmers. Who in their right mind wants to create more milk and lower prices on their own product. We have already decimated the small farming communities in Minnesota. We here complaints about how far a veterinarian or machinery dealer or dairy parts facility are from these large dairies. More expansion of dairy will only cause more destruction to Minnesota and its people.

Karie Kirschbaum **Letter 590**

ATTN: Charles Peterson

My name is Karie Kirschbaum. I previously served as Mayor of Gary, Minnesota, and as Chair of the Norman County Economic Development Authority. I currently serve as National Sales and Procurement Director for a grain mill based in Northwest Minnesota, working closely with agricultural operations across the region, including Riverview.

I am writing in strong support of Riverview Dairy’s proposed West River Dairy expansion in Stevens County.

Riverview established its presence in Waukon Township, Norman County, in 2021. Since that time, it has proven to be a significant and positive economic force in our region. From the outset, Riverview committed to operating as a responsible and community-minded partner, and they have consistently delivered on that commitment. Their presence has contributed to local economic growth, supported housing development, strengthened school enrollment, and created opportunities for a wide range of agricultural and service-based businesses.

In my current role within the agricultural sector, I see firsthand the importance of a strong and stable livestock industry. Operations like Riverview provide dependable economic activity that supports local jobs, drives continued investment, and enables businesses like ours to grow and reinvest in rural communities.

The proposed expansion represents a meaningful opportunity for continued regional growth. It will create demand for local vendors, support both construction and long-term employment, and contribute

to the overall vitality of rural Minnesota. Projects like this are critical to maintaining a competitive and sustainable agricultural economy and ensuring that communities across our state remain strong and viable.

Minnesota's environmental review process is thorough and rigorous. Based on that, I do not believe an Environmental Impact Statement is necessary for this project.

I respectfully encourage your support and approval of Riverview Dairy's expansion.

Sincerely, Karie Kirschbaum

Brooke Gordon **Letter 591**

ATTN: Charles Peterson

My name is Brooke Gordon, and I am a local resident in Dublin Township, Murdock, MN. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project.

Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Brooke Gordon

Michael J. Yost **Letter 592**

ATTN: Charles Peterson

My name is Michael J. Yost and I am a farmer from Murdock, MN in Dublin Township, Swift County. I am writing in support of the proposed West River Dairy Expansion. For over 25 years our farm has been

involved with Riverview Dairy, and we could not have asked for a better partner in our community. Based on our first-hand experience, Riverview Dairy operates with professionalism, integrity and environmental responsibility. Simply put, they are the definition of what you look for in a business that you want to have in your community and your state, they do things the right way.

Manure management and water usage are highly regulated in Minnesota and I recognize the importance of having high standards when it comes to practices that impact our environment. Through rigorous nutrient management planning, soil testing and ensuring that proper application rates are followed, Riverview not only meets these standards to ensure responsible stewardship but often exceeds them.

The use of manure as a nutrient source has significant benefits for all farms. On our farm, by having access to manure, we have been able to dramatically reduce commercial fertilizer usage. Our fields have also seen improved soil health, an increase in organic matter and a reduction in erosion and runoff. The result is a win-win for both farmers and the environment.

Riverview's track record speaks for itself. They support farmers, create jobs, maintain roads, and invest in schools and local programs. Their open communication and transparency with local farmers, businesses and officials reflect Riverview's commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process – one of the most rigorous in the region – and provides adequate oversight for this project. Based on available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory steps, such as a requirement for an environmental impact statement (EIS), are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship.

Sincerely,

Michael J. Yost

Yost Farm Inc.

Chris Dauer **Letter 593**

Attn: Charles Peterson

My name is Chris Dauer, I am the owner of Dairyland Supply in Sauk Centre, MN and Courtland Waste Handling Inc. in Courtland, MN. We offer a wide range of agricultural equipment that services customers in and out of the State of Minnesota, including Riverview. I am writing in support of Riverview and their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

In closing, Riverview has been a valued client and nothing short of incredible to partner with. This business not only talks the talk but walks the walk. Riverview genuinely cares about their employees and vendors they conduct business with. They are stewards of the land and are of the most professional companies I have ever had the pleasure of doing business with.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Chris Dauer

Sharon Vipond **Letter 594**

Being a land owner, I am concerned for the safety of our environment which includes care the air, our water, the soil. This expansion of 11,000 dairy cows needs to have an EIS completed and evaluated before any permit can be granted. The people need to know if it would compromise our air quality, the negative effects on acquafirs and the condition of water that would be released onto the land, ditches and lakes. Besides bigger isn't necessarily better for anyone including the dairy cows.

Many Mn small dairy farmers have had to sell their cows which is sad and unfair because of the monopoly on the price of milk sold by the huge dairy operators. Please prevent this exspansion from happening. The state benefits when we have smaller farms and businesses.

Thank you

Bo Massner, McGinnis Appliance Heating & Cooling **Letter 595**

ATTN: Charles Peterson

My name is Bo Massner, and I am the owner of McGinnis Appliance Heating and Cooling. We are an appliance and HVAC small business serving agricultural operations across Minnesota like Riverview. I am writing in FULL SUPPORT of their proposed West River Dairy expansion in Stevens County.

Our company has been around for over 50+ years. When the first dairy started in Stevens county we were there from the beginning helping with the design of heating and cooling systems in the apartments and housing, appliances for kitchens and laundry all around the dairy to chiller systems that cool the milk and heat in the required buildings and around the works areas for the cows. From my personal experience first hand on the dairies, Riverview has been a very supportive customer of ours. Every time I get to go work out in the barns, I am amazed at how well the cows and facilities are taken care of. The cows are always happy and curious when I walk by their spacious areas. To me everyone should take a tour to see how amazing this operation truly is. We are very lucky to have them be a part of our community.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create a strong and consistent economic activity that supports local jobs,

drives investment, and allows businesses like ours to grow and reinvest in our communities. It allows our small business to donate and give back to local groups that also help the Stevens county community thrive.

The proposed expansion represents a meaningful economic benefit to the region. It will generate more demand for local business like ours, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a very professional and reliable partner that contributes positively to the communities where it operates. Their presence greatly strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to Home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and APPROVAL of this important project.

Sincerely,

Bo Massner (Owner/McGinnis Appliance Heating & Cooling)

Bryce E. Gibbs, Pinion **Letter 596**

Dear Mr. Peterson:

My name is Bryce Gibbs, and I am a principal at Pinion, LLC a consulting and accounting firm that serves agricultural operations across the United States, including Riverview. I am writing to express my support for Riverview's proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's generate consistent economic activity that supports local jobs, drives investment, and helps rural communities thrive.

In my view, the proposed expansion would provide economic benefits to the region by increasing demand for local vendors, supporting construction activity, and contributing to long-term employment.

Based on our experience working with Riverview, they have been a professional and reliable partner, and have a constructive presence in the communities where they operate. Their investments support a broad network of agricultural and service-related businesses.

Based on my understanding of the project and Minnesota's environmental review framework, it is my understanding that an environmental impact statement (EIS) may not be required. As you complete your review, I respectfully encourage the Agency to consider the project's economic benefits alongside its proposed environmental safeguards. Thank you for your time and consideration; please let me know if I can provide any additional information.

Respectfully,

Pinion, LLC

Bryce E. Gibbs, Principal

Joe Koehl **Letter 597**

I think it is a good thing for me and my operation it gives me some extra employment opportunity. It's another place in the area to market crops. It's another crop nutrient opportunity so you don't have to import so much commercial fertilizer this can help organic crop farms

Lowell and Pat Nelson **Letter 598**

ATTN: Charles Peterson

Our names are Lowell and Pat Nelson, and we are land owners in Stevens County, which we are currently renting out to local farmers. We support agricultural operations in Minnesota like Riverview. We are writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture. From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. We respectfully encourage your support and approval of this important project.

Sincerely,

Lowell and Pat Nelson

Tracee Skaurud **Letter 599**

My name is Tracee Skaurud. I am in favor of the West River Dairy Expansion. Our farm is next to a RiverView dairy. We live 1 1/2 miles from the dairy and I don't even notice that it is there. The operation is as clean as it gets. It's amazing actually. I grew up on a small dairy farm as a kid and it has changed so much. Technology is better, the way they apply manure is efficient and safe. Water has never been an issue at all. The way they treat there cows and there calves is with complete care and compassion. Like dad always said. A happy cow makes more milk.

From experiences on our farm, MN is one of the most highly regulated states for agriculture In The USA. I trusted MPCA did all there research when the dairy was built here and it has gone very well, and I would trust them again. You don't need an EIS.

Mark Stromswold **Letter 600**

Riverview is a good steward of the land and a respected owner of cattle.

The water usage stated is the 'no rain' amount that must be used for consumption if no rain occurs. Over 50% of water used during normal rain years comes from impervious runoff with on site storage. Just one example of forward thinking by a corporation.

Justin Gaukler **Letter 601**

Riverview is super beneficial to all local farmers. On our farm we haul about 300,000 bushel of corn to them every year for grinding. We also have the chop 800 acres of corn. We are very pleased with having them in our local area.

Travor Timm **Letter 602**

I stand with Riverview as they navigate the permitting process for the West River Dairy expansion. Im confident in their commitment to responsible stewardship, environmental compliance, and supporting Minnesotas agricultural community.

Mike Staples **Letter 603**

My name is Mike Staples, and I farm in Synnes and Baker. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations farming a mile away from West River Dairy for 16 years now with my cousin, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and the odor is a minimum for the size of the operation.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability. By adding another facility of this size will increase the need for more acres of silage and hay as well. I see this as a positive for local demand for corn. Obviously will increase the acres needed to put manure on as well. We get a little manure from West River Dairy already and we wish we could get more every year.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Mike Staples

John Sertich, Nuss Truck & Equipment **Letter 604**

My name is John Sertich and I am the Regional Manager of Nuss Truck & Equipment who sells and services numerous agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses. Nuss Truck & Equipment has valued our relationship with Riverview (and it's related companies) since 2008. During that time we have also grown our footprint in the Western Minnesota agricultural sector along with numerous other construction and trucking companies. We have found that many of these communities and businesses were not being served at the same level as larger metropolitan areas. The growth of responsible businesses like Riverview has also facilitated growth in our employee base who live, serve, volunteer and support the many local businesses in the area.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

John Sertich

Rita Bolluyt **Letter 605**

We are concerned about the increased amount of and area which will be used for manure application. Some of this land will be adjacent to and is tiled to drain to Page Lake--which would contaminate the lake.

Also, the manure application initially and for the first few days--greatly affects the air quality making breathing it unpleasant at best. This seems to be caused by the applicators which when turning at the ends of the fields, raise above the dirt and spread the liquid on top of the ground.

Adam Lichtsinn **Letter 606**

ATTN: Charles Peterson

My name is Adam Lichtsinn, and I am a farmer in Dollymount, Traverse County, MN. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports longterm agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Adam Lichtsinn

Paul Tackes **Letter 607**

Minnesota is known for its quality of water. Though industrial pollution is less today than 60 years ago, agricultural and residential runoff has greatly contributed to the decline of water quality.

Recreating by canoe on smaller waters makes one realize how they have deteriorated over the years. Once clear waters are now a soupy, smelly mess by midsummer. While small scale dairy operations are suffering from unsustainably low milk prices it seems counterintuitive to promote large scale dairy operations. These operations force family dairy operations out of business causing declining vitality of small communities all over the farming communities. I digress.

The scale of the factory dairy farms produces so much concentrated waste in a small area that it is always a risk for loss of containment. Historically, small farms could manage the manure and use it on their land with far less risk of watershed or aquifer contamination. That cannot be said for these large scale operations. Concentrated turkey, hog and dairy operations are of great concern to me. I witnessed, living in Montana, how mining operations promised "foolproof" containment only for the taxpayer to pick up the mitigation costs after the company and its well golden parachuted executives were off the hook. How long will it be before I have to operate a costly decontamination system for my well, much less endure the smell and low quality waterways and lakes. I urge that this permit be denied.

Steve Molenaar **Letter 608**

I am concerned about the environmental effects of intensive land use by large farming operations. Rather than be served by a few giant dairies, I feel the public is better off with smaller operations spread throughout the state. The manure can be more widely distributed, resulting is a lessened environmental impact and as a side benefit, the industry will not be controlled by just a few providers.

James Radermacher **Letter 609**

ATTN: Charles Peterson

My name is James Radermacher. I am a resident of Kandiyohi County near Willmar, MN. I am writing in support of the proposed West River Dairy Expansion.

I have been working in the Ag Industry for most of my life. I have been a Certified Crop Advisor since October of 2007. I have also received my Technical Service Provider designation within the last couple of years.

It has been my experience working with crop and nutrient management planning in Minnesota that the regulations currently in place are sufficient to regulate water quality, and environmental impacts of livestock farms in rural Minnesota.

The manure that is produced from the Riverview Dairy facilities has been a valuable resource for the local farms who are located near their locations in my area. It not only provides local crops with valuable nutrients but adds a biological component to the soil producers cannot get with commercial fertilizer alone.

Riverview has become a very beneficial partner for local farms in my area. They provide an opportunity for local growers to participate in harvest operations that helps add an additional revenue source for their operations. They have also been very strong supporters of the local communities that are in the vicinity of their dairies.

From my experience with Riverview, I strongly support the expansion of the West River Dairy site. I have confidence they will follow all regulations and laws that pertain to Environmental Stewardship that will be part of the expansion.

Sincerely,

James Radermacher

Gates Blodgett **Letter 610**

I have worked with Riverview for over 10 years and consider them a key positive contributor to the Minnesota Agricultural sector. They are the gold standard in the dairy business with incredibly efficient, humane and smart operations that produce solid jobs and meaningful community involvement. The expansion of the West River site makes a lot of sense and I know they will be as careful with this project as any of the many dairies they have constructed in the recent past. Riverview's attention to detail, their community engagement, their respect for employees, their careful/humane treatment of cows and their stewardship of the land adjacent to their sites is something that should be honored and encouraged.

Darlene Donahue **Letter 611**

The water usage is a concern. If Morris grows or has dry years, the Dairy using potentially 75% of the water would create problems for the area. I believe the Dairy needs to scale back their size and not ne allowed to use more than 50% of the water. The size is also a concern regarding the land, and water in the area.

Randy Pothen **Letter 612**

My name is Randy Pothen and I farm in Swift County and have lived less than 1 mile from an existing Riverview site for 18 years. The reasons I support the permit for the West River Dairy expansion are as follows.

1. We've farmed for 48 years and I've never seen cleaner, better managed livestock facilities! 2. We have been able to market corn silage and alfalfa to the local dairy instead of shipping many of those acres of production overseas.

3. Alfalfa grown near the dairy sites is fantastic for our soils and gives us another crop for rotation.

4.Manure is applied by injection in the fall and has been a plus for our soil fertility in the area. We have all been reminded recently of the costs involved of shipping crop nutrients, especially nitrogen products, from areas like the Persian Gulf and the Strait of Hormuz.

5. I believe the West River Dairy expansion would be positive for the area and I strongly support the permit.

Sincerely

Randy Pothen

Christopher Spangler, Perspective 180 LLC — Letter 613

ATTN: Charles Peterson

My name is Christopher (Kit) Spangler, and I am the owner of Perspective 180 LLC, a consulting company that has provided consulting services to Riverview LLP. I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

My work has been primarily in international business, working with dairies in China and Indonesia. I have had the opportunity to accompany international dairy companies to visit Riverview's operations in the upper Midwest. Riverview is seen internationally as a leader in how to build and operate large scale dairy operations in a responsible and environmentally responsible manner. Because of this reputation, they are frequently asked to host international dairy delegations. From my interactions with Riverview, how they operate their dairies reflects the company culture they have built over several decades. They stress being an asset to any community not only economically, but also socially and environmentally.

Prior to my work internationally, I also operated my own dairy farm for 28 years and worked as a consulting dairy nutritionist for 24 years. That experience allowed me to observe varying management styles of dairies in the upper Midwest. In my opinion, Riverview is without a doubt one of the cleanest operations I have seen, both here in the United States, as well as abroad. They would not operate a dairy without commitment and responsibility to their community.

Sincerely,

Christopher (Kit) Spangler

Perspective 180 LLC

Steven Wendling — Letter 614

We live within 2 1/2 miles of Riverview's Washington Dairy. I farm around this dairy and have nothing but positive views on Riverview. You will not find a cleaner, better managed dairy anywhere. Their manure management system is very well run. Some have worried about township roads including myself, but now we have some of the best township roads due to Riverview taking care of any roads

they use. That includes even completely rebuilding some dirt roads into nice gravel roads. I feel Riverview will be a benefit to any community. They have had lasting beneficial impacts on our community.

Kevin Lundberg **Letter 615**

ATTN: Charles Peterson

My name is Kevin Lundberg and I am a Farmer in Dublin Twp, Swift Co MN, I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports longterm agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Kevin Lundberg

Former Neighbor **Letter 616**

I am a former resident of Stevens County and neighbor to Riverview. I have many family members in the area and have plans to return to the community. I was also part of the contingency that was successful in requiring a full environmental impact review that shut down their planned expansion south of Chokio in Baker township 10+ years ago. You're Welcome Stevens County! The biggest issue then, as it is now, is water. The aquifer simply wasn't meant to sustain this density of animals.

Stevens County has enough cows. The market is saturated already with Milk. Has anyone taken a critical look into the finances of these megadairies. Milk prices are subsidized by the federal government and the market is saturated. The buildout on these large dairies is in the $50M-$100M range. These expansions are not financed with equity. Why? Because milk prices have never supported $50M-$100M

capital investments. They are financed with new investors and that is why they have to keep building them. Constant expansion to avoid the inevitable collapse when the bill comes due. All of this at the expense of our aquifer and the environment. Essentially a Ponzi scheme to eat up resources and drive out small business and keep milk prices compressed. Definitely not the free markets at work. I am sure that Riverview is a good steward in the community. I can't argue one way or another because I don't live there. If I ran the company I would make sure I invested heavily in making sure the labor and resources I were exploiting felt like they were valued. I saw a lot of comments from local businesses talking about the economic engine that Riverview is and how happy they were doing business with them. It is never good to have your customer base this consolidated. If I were a business and Riverview was my only customer, I am not going to be around long. Riverview will only be around as long as they can find new investors to keep the expansion ahead of the bill.

Karen Hettver **Letter 617**

We are a neighboring resident only a few miles to the West of the West River Dairy.

When they put that first dairy in, our well water started with black silt in the water. We ended up having to dig a brand new well. If they put that many more dairy cows in, that is going to take more water than it is already and more land to get rid of the manure, also we should worry about run off into our streams and lakes.

I am not in favor of the expansion.

Richard and Catherine Tate **Letter 618**

My wife and I are investors in Riverview Dairy for the past 20 plus years. Based on my observations they are professional, have a high level of integrity, and environmental responsibility. There facilities are well maintained, clean, and organized. They are committed to doing things the right way. including manure management. They are a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. In closing, we respectfully encourage the appropriate agencies to approve the West River Dairy expansion.This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship.

Pat Ascheman **Letter 619**

ATTN: Charles Peterson

My name is Pat Ascheman. I am a farmer in Fairfield Township (Holloway), Minnesota, and I have worked with Riverview for many years. I am writing in strong support of the proposed West River Dairy Expansion.

From my long experience working alongside Riverview, I have nothing but respect for their integrity and the way they operate. Their facilities are well-maintained, clean, and organized, and their staff approach their work with professionalism and a clear commitment to doing things the right way.

I know manure management and water use are tightly regulated here in Minnesota. Riverview consistently follows those regulations — nutrient management planning, soil testing, proper application rates, and timing based on field conditions — and, in my experience, strives to meet or exceed those standards. They treat manure as a valuable nutrient source that improves soil health, increases organic matter, and helps reduce erosion, which supports long-term agricultural sustainability in our area.

Riverview is also a strong community partner. They support local farmers, create jobs, help maintain roads, and invest in schools and local programs. Their communication with neighbors and local officials reflects a genuine commitment to being a good neighbor.

I understand the project is under environmental review through Minnesota's established process, which provides robust oversight. Based on Riverview's proven track record, existing regulations, and the available data, I am confident this operation can continue to be managed responsibly. I believe the current review process is sufficient and that an Environmental Impact Statement (EIS) is not necessary.

For these reasons, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion.

Sincerely,

Pat Ascheman

Donita Ascheman **Letter 620**

ATTN: Charles Peterson

My name is Donita Ascheman. I am a farmer in Fairfield Township (Holloway), Minnesota, and have lived near several Riverview Dairy operations since they began. I have visited their properties many times and have observed their daily operations. Riverview should be commended for maintaining well-managed, controlled, and clean facilities. My husband and I have consistently done business with Riverview, and in every instance they have acted with professionalism and integrity.

As farmers in Minnesota—a state that depends heavily on agriculture—the ability to market corn to Riverview and to receive manure as a nutrient source is essential to our farm business. I support the West River Dairy expansion and believe Riverview has proven, and will continue, to comply with the rules and regulations set forth by the state of Minnesota.

Sincerely,

Donita Ascheman

Mario Alvarez **Letter 621**

Riverview is an excellent company that not only supports its people but also the entire community. It stands out for its commitment to local infrastructure, such as maintaining roads, and for the strong support it provides to farmers. Through its operations, it helps drive economic growth across the entire region.

Schurkey Swanke **Letter 622**

This MUST NOT BE ALLOWED.

That many animals will create an enormous burden on the local and area environment, perhaps the regional environment. They will contaminate air, water, and soil with an excess of waste.

At least as important is that a huge number of animals CANNOT be properly cared-for. This is going to be "cruelty on the hoof". They will use an excess of antibiotics to control disease that wouldn't happen if the critters had appropriate room to move around in, and weren't so concentrated.

John Franey **Letter 623**

Such a large expansion needs to be carefully considered. The environmental impact of a massive increase in the operation of Riverview dairy, while monetarily beneficial, would have potentially irreversible effects on the place we live, and needs to be carefully calculated and researched with a deep sense of stewardship rather than profit.

Mike Koehl **Letter 624**

ATTN: Charles Peterson

My name is Mike Koehl and I am a neighboring farmer in Horton township of Stevens County. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports longterm agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Mike Koehl

David Kruize **Letter 625**

100% against this! How can you even consider this without a EIS study when there would end up having 26,397 animals in one site. Where is the common sense? The Pomme De Terre Water shed is nearby.

Trent Timm **Letter 626**

Dear Mr Peterson,

I am writing to express my strong support for Riverview Dairies and their proposed West River Dairy expansion.

Riverview Dairies has consistently demonstrated a commitment to operating clean, well-maintained. and professionally managed facilities. Their dairy operations are orderly, environmentally responsible, and reflective of high standards in animal care and site management. In my experience, their facilities are kept in excellent condition, and they take pride in maintaining their property in a way that positively represents modem agriculture.

Beyond their operational standards, Riverview Dairies provides meaningful benefits to the local community. They create jobs, support local businesses, contribute to the tax base, and strengthen the agricultural economy in the region. Their presence helps sustain rural communities and ensures continued economic vitality.

Based on their track record and the way they manage their existing facilities, I am confident that the West River Dairy expansion will be handled responsibly and with respect for environmental regulations and community standards.

Thank you for your time and consideration. I appreciate the opportunity to share my support for the West River Dairy Expansion.

Sincerely,

Trent Timm

Mark Billstrom **Letter 627**

ATTN: Charles Peterson

I am the president of Lester Building Systems, LLC, an engineered wood-frame building engineer and manufacturer based in Minnesota serving many market sectors, including agricultural operations in Minnesota, like Riverview, LLP. I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

I have had many opportunities to tour their dairy facilities and never cease to be impressed by the overall operation, the employees, and how well the animals are treated.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Mark Billstrom

Phillip Horsager **Letter 628**

My name is Phillip Horsager, and I am a neighbor, farmer, and business owner in Grace Township, Chippewa County. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well- maintained, clean, and organized, and their teams are committed to doing things well and respectfully.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. All my experience indicates that Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability. Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process. Based on the available data, existing regulations, and Riverview's positive track record, I believe this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unhelpful.

I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is ill-disposed to benefit the community, the environment, and the State.

Sincerely,

Phillip Horsager

Jeremy Bottelberghe, Redfield LLC **Letter 629**

ATTN: Charles Peterson

My name is Jeremy Bottelberghe, and I am the owner of Redfield LLC, a Concrete Contractor serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview’s create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Jeremy Bottelberghe

President

Redfield, LLC

Jeff Karschnik **Letter 630**

ATTN: Charles Peterson

My name is Jeff Karschnik I am an alumni of University of Minnesota Morris and a partner of Riverview Dairy I am writing in support of their proposed West River Dairy expansion in Stevens County.

Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities. This community helps support the University of Minnesota Morris.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

Riverview is a professional and reliable business that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Jeff Karschnik

Kurt Staples **Letter 631**

My name is Kurt Staples and my family has farmed here for over 100 years. I live 3 miles from West River Dairy, as does my son and his family. First let me address the 1000 lb gorilla, manure. Riverview has done everything in the past to apply the manure in a safe and responsible manner. If there was a issue, it was taken care of. Manure is not so much a waste product but a commodity, it is beneficial to the fields it is applied to and the farmers using it. Next Issue: Water. This is where I am not in support. I live 3 miles from West River and 3 miles from the next well site. Others in our area have seen issues with their wells in the past. Using more water is not an option. My question to those granting said permit is who is to be held responsible if our wells go dry? Is this in writing? And uphold-able in a court of law. For this reason I am not in support of the expansion.

Representative Dave Baker **Letter 632**

Thank you for allowing me to comment. Having worked with this company for a number of years and the level of professionalism and commitment to bring a positive impact on the community I strongly urge this to proceed. Great jobs coming and a wonderful employer!

Kathryn Buendgen **Letter 633**

I live in Stevens County and am concerned about the environmental impact of such a large dairy operation. How will this affect our ground water and the overall usage of water. Has an economic plan been put into place as this will certainly further put smaller herd dairy farmers under additional financial stress. Small farms are the back bone of our agricultural economy. Where will additional farm workers live as there is a shortage of housing in Morris. At this point, I am a big NO until questions can be addressed as to how this is going to affect our ground water and environment. This dairy operation is large enough.

Lucio Minces **Letter 634**

Completely oppose. It blatantly defies common sense that this will not produce unmanageable amounts of manure and in tandem water and soil contamination, and deleterious impact on infrastructure. It would not pass a serious investigation on the environmental and economic impact, so I hope the regulatory entities are serious in reviewing this

Renee Konz **Letter 635**

ATTN: Charles Peterson

As a locally elected school board member in Morris. I am writing to express my strong support for the proposed West River Dairy expansion. In my time with Riverview, I have consistently found the company to be transparent, approachable, and committed to the communities where it operates. When questions arise, Riverview engages in open dialogue and welcomes community members to tour its facilities. This good-faith engagement gives me confidence that Riverview will continue to be a responsible operator as the expansion moves forward.

Riverview's business model is built on collaboration. Hundreds of local farmers work directly with Riverview—growing crops to feed the dairy herd and receiving manure to improve the fertility of their fields. This strengthens individual farm operations and helps keep them viable. Dairy farms like Riverview's also benefit our rural economies. In out-state Minnesota, where economic development opportunities are limited, this kind of sustained, locally rooted investment is essential. Through its investments and employment, Riverview has strengthened our local tax base, helped stabilize enrollment, and generously supported our schools.

Riverview has responsibly managed natural resources in our community, and I am confident that the West River Dairy expansion would be no different. Riverview is passionate about providing opportunities for people, and that starts with a clean and safe environment. I do not believe an Environmental Impact Statement is necessary for the proposed project. I strongly encourage the MPCA and other regulatory agencies to grant Riverview its necessary permits without further delay.

Thank you,

Renee Konz, Morris Area School Board

Judith Derauf **Letter 636**

To the Minnesota Pollution Control Agency:

Enough is enough! Concentrated Animal Feeding Operations are bad for the environment, bad for rural economies, and bad for the animals raised under these conditions. As the state regulatory agency permitting and regulating these operations, you must do more to protect the people of Minnesota from this destructive industry. Is there no upper limit to the number of animals allowed on a CAFO site? Why are these operations getting bigger and bigger when the water and air quality in the areas near these operations is becoming more and more polluted? This is cause and effect and it doesn't take an expert to see that regulations are too slack or are not being enforced.

Regarding, the proposed West River Dairy Expansion I am asking you as an agency to demand a full Environmental Impact Statement for this project. I believe careful analysis needs to be done before issuing a permit for any Concentrated Animal Feeding Operation, but when the number of animals on an existing CAFO is going to be more than doubled a simple Environmental Assessment is not adequate.

Keith Doane **Letter 637**

The expansion is only going to benefits the pockets of its owner and investors. It will not benefit the real stakeholders- the environment and the farmers who need more opportunities in farm business.

Can we even hold Riverview LLP accountable in any case of environment damage in the future? If we cannot guarantee the accountability, then we must not let Riverview LLP have this opportunity to abuse the environment.

Please do not grant this permit to the Riverview, LLP.

Jesper Rosendahl **Letter 638**

I'm very much in favor of this requested expansion project. Riverview is a key driver of financial growth in the region creating many high-quality jobs. Furthermore Riverview is always keeping business ethics for its employees, partners and community to highest standards. Increased dairy production in the US are required to support increased demand for higher quality and healthier foods.

Adam Johnson **Letter 639**

Modern dairy farmers have not only proven that proper wastewater management is possible, but that it is beneficial to the surrounding community, watershed, and the farmers themselves.

Thiago Carvalho **Letter 640**

Disclaimer: I am not employed by Riverview, LLP but I am personally working with them in a separate project.

Having met several decision makers in the company, I know that Riverview puts high priority on the quality of their products and the impacts on its employees and communities. I have high confidence that Riverview is concerned with the societal, environmental, and economic impacts on the Morris community and will do everything in its power to achieve win-win solutions with residents and lawmakers. This expansion project is a great opportunity to provide jobs in a high-quality employer in the area and meet demand for food.

Nedd Knobloch **Letter 641**

ATTN: Charles Peterson

My name is Nedd Knobloch, and I am the owner/operator/employee of an agriculture company with agricultural operations like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses. I believe and support Riverview's core values and beliefs.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home. There are multiple examples of communities that lack economic engines like Riverview and the impacts are detrimental.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project. Riverview's environmental stewardship is far and above than any other I have experienced. I would have no concern with the expansion.

Sincerely,

Nedd Knobloch

Seth Berg, Sentry **Letter 642**

ATTN: Charles Peterson

My name is Seth Berg, and I'm with Sentry. Our company does millwright work, roll-off container service, and crane work for ag operations, including Riverview.

I'm writing in support of their expansion at West River Dairy in Stevens County.

Work like this matters to businesses like ours. Projects like Riverview's keep guys working, keep equipment moving, and support a lot of local vendors and contractors. It's not just one operation—it has a ripple effect across the whole area.

From what we've seen working with Riverview, they run a solid operation and are good to work with. They know what they're doing and handle things professionally.

In my opinion, the current environmental review process is more than adequate, and I don't see a need for an additional EIS. I'd encourage you to approve the project.

Sincerely,

Seth Berg

Taya Hemphill **Letter 643**

Please assess properly what this will do to not only the land but also small businesses and Minnesota as a whole.

Brooke Reynolds **Letter 644**

I oppose having this giant CAFO in Minnesota. These sprawling industrial facilities jeopardize our natural resources, animal welfare and public health.

The environmental harm caused by these massive operations is especially troubling. At Riverview's proposed facility, vast quantities of manure would generate significant greenhouse gas emissions and likely seep into nearby waterways, posing a threat to our state's iconic lakes and rivers. This risk is reinforced by Riverview's history of manure spills in western Minnesota.

That pollution also threatens the health of Minnesotans. Manure runoff can contaminate drinking water with nitrates, which is especially dangerous for infants. It also releases phosphorus that can lead to algae blooms, making lakes unsafe for swimming. In 2015, a child was hospitalized and a dog died after exposure to toxic algae while swimming in an Alexandria lake. Tragedies like this are preventable by curbing agricultural runoff.

Marlowe Engler **Letter 645**

I support the West River Dairy

Nicole Wallace **Letter 646**

Please do not bring suffering that comes with this type of farm to people, animals, environment.

Just say no!

Travis Miller **Letter 647**

I am writing in support of Riverview's West River Dairy expansion. My family has known and worked with the Riverview group for many years and in a variety of different capacities, and we have consistently found them to be professional, responsible, and committed to excellence.

In 2018, Riverview constructed a 10,000-head dairy near Campbell, Minnesota (Campbell Dairy). Since that time, I have seen firsthand the positive economic impact they have brought to the surrounding area. They are a strong economic driver, providing meaningful employment opportunities for local residents and contributing to the overall strength and stability of the rural economy.

Beyond job creation, Riverview adds significant value to local agriculture. Their dairies create an additional, reliable end user for grain, giving farmers more market opportunities and stability. They also help improve the land by putting nutrients back into the soil, which supports healthier, more productive farmland over time.

Another aspect that stands out is how clean, organized, and well-maintained their sites are. Their facilities are operated with a high level of care and attention to detail, reflecting their respect for the land, the community, and the people they work with.

Riverview's team is made up of honest, hardworking, and passionate individuals who take pride in their work and remain mindful of their neighbors and the broader community. They operate with integrity and a clear commitment to doing things the right way.

I firmly believe that Riverview has made the land, roads, schools, and community stronger since establishing operations in our area. They are exactly the kind of neighbor and partner that rural communities benefit from, and I fully support their continued growth and expansion.

Erin Larson **Letter 648**

Dear Commissioner Kessler and MPCA Staff,

I am writing to express my support for the proposed expansion of West River Dairy near Morris, Minnesota. Having followed this process and reviewed the comments of neighbors, farmers, environmentalists, and agricultural organizations who know Riverview's operations firsthand, I am confident that this expansion represents not only a sound economic investment in our region, but a genuine step forward for environmental stewardship in Minnesota agriculture.

A common misconception is that expanding livestock operations is inherently at odds with environmental protection. The reality is exactly the opposite when the operator is as committed to best practices as Riverview has proven to be. Today's dairies operate in a vastly more regulated and technologically advanced environment than previous generations. Riverview employs precision nutrient management planning, rigorous soil testing, controlled manure application schedules tied to field conditions and seasonal timing, and data-driven monitoring systems that continuously verify environmental compliance.

One particularly compelling environmental benefit of this expansion is water stewardship. As noted by supporters familiar with Riverview's infrastructure, more than half of the water used during normal rainfall years comes from captured impervious surface runoff stored on-site. This kind of forward-thinking water management is exactly the approach we should be encouraging in Minnesota agriculture, and it sets a model for the entire industry.

Perhaps the most under-appreciated environmental benefit of these well-managed dairies is what happens to the manure. Far from being a pollutant, manure managed according to Minnesota's nutrient management standards becomes a valuable agricultural resource. Certified Crop Advisors and farmers in the region surrounding Riverview's existing facilities have documented real improvements in soil health, including increased organic matter, better soil structure, and reduced erosion. These may be outcomes that no commercial synthetic fertilizer can fully replicate.

This project is not proceeding without scrutiny. It is undergoing one of the most thorough environmental review processes available in state government. Multiple farmers, agronomists, and community members who have worked alongside Riverview for years have affirmed in their comments that the company's mindset is not merely to meet regulatory minimums but to exceed them. The MPCA's existing permitting and oversight framework, including nutrient management plan requirements, manure application restrictions, setbacks, and monitoring obligations, is specifically designed for farms like this one. Requiring an Environmental Impact Statement beyond the already comprehensive Environmental Assessment Worksheet process would be redundant given the available data and Riverview's well-documented compliance history.

Rural communities like Morris and Stevens County depend on operations like West River Dairy to sustain local economies, keep family farms viable through crop and harvest partnerships, and support the schools, businesses, and infrastructure that make rural life possible. But these economic benefits do not come at the expense of the environment - they are paired with it. Riverview's long-standing working relationship with the MPCA, its transparent engagement with neighboring landowners, and its

consistent investment in environmental improvements demonstrate that responsible growth and environmental protection reinforce each other.

Approving this expansion sends exactly the right signal: that Minnesota welcomes responsible agriculture and that operators who do things the right way will be able to grow and continue serving their communities.

I respectfully urge the Minnesota Pollution Control Agency to approve the West River Dairy Expansion. The environmental safeguards in place are rigorous. Riverview's track record is strong. The benefits to soil health, water stewardship, nutrient recycling, and the broader regional agricultural ecosystem are real and well-documented. This is the kind of project the permitting process was designed to review and approve and it deserves to move forward.

Sincerely,

Erin Larson

Emily Johnson **Letter 649**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

• Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

• Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

• Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

• Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments. Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible. It is critical that the MPCA require a full Environmental Impact Statement.

Sarah Super **Letter 650**

I strongly oppose the West River Dairy Expansion.

Amanda Churchill **Letter 651**

Hello,

I am writing to express my deep concern about and strong opposition to this proposed dairy expansion. I oppose factory farms (CAFOs), as they jeopardize our natural resources, animal welfare and public health.

Countless dangers would come with this expansion, like polluting air and waterways, rural residents facing health risks in proximity to a factory farm, crowded conditions and spreading of zoonotic diseases, not to mention the greatly increased animal suffering.

This is unsafe for all of us. Please hear the voices of concerned Minnesotans, speaking for ourselves and for animals and the earth.

Thank you.

Claire Lienesch **Letter 652**

Hello,

I am very concerned about this proposed expansion due to the effects on the animals themselves and the neighbors' air and water quality. CAFO operations routinely disrupt the quality of life of the surrounding people due to the amount of waste a concentrated amount of animals produce, not to mention the accompanying issues like increased traffic by milk tanker trucks. I also highly doubt this many animals on one farm can live a healthy, disease-free life.

Please know I am a big-time dairy fan- my family drinks about 2 gallons a week of milk- and I am very much opposed to this project. Please study the issue to determine if this many animals can live in close quarters without disrupting the air, water, and quality of life of the people in the surrounding area.

Thank you!

Claire Lienesch

Wendy Pilot **Letter 653**

Public Comment to the Minnesota Pollution Control Agency

Re: Opposition to Proposed Largest Factory Farm in Minnesota History

To Whom It May Concern,

I am writing to strongly oppose the proposed construction of what would be the largest factory farm in Minnesota's history. The sheer scale of this facility makes my concerns even more urgent.

First, a factory farm of this magnitude would pose an unprecedented environmental threat to our state. The enormous volume of waste generated would put our waterways, air quality, and ecosystems at far greater risk than anything Minnesota has seen before. Once that damage is done, it cannot easily be undone.

Second, despite its massive size, this type of operation is notorious for offering low-wage, unsafe working conditions. Employees often from vulnerable communities face physical hazards, limited benefits, and little job security. Bigger does not mean better for Minnesota workers.

Finally, a facility of this scale would subject an extraordinary number of animals to severe and inhumane conditions, confining them in overcrowded spaces with no regard for their welfare. This is simply not in line with the values Minnesotans hold dear.

We have one chance to stop this before it is built. I urge the Agency to deny this proposal and protect our land, our people, and our animals.

Respectfully,

Wendy Pilot

Ken Koehl **Letter 654**

Ken Koehl

Stevens county resident

I strongly support moving forward with the expansion of the west river dairy. I live 1 mile away from the d45 dairy, Riverview is very capable of handling this expansion in professional manner they take care of the manure according to mpca rules and dont cut corners. Riverview is a benefit to rural economy's providing farmers with high quality fertilizer and a better basis for corn.

A EIS is not necessary for this project Riverview wants the best for the environment and neighbors.

Please move forward with the project I support.

Jocelyn Bullock **Letter 655**

Hello,

These mega farms are horrific.. have you not seen the footage? Because many still refuse to acknowledge animals as feeling creatures with rights to live free from cruelty I will share. Mother cows are impregnated bu human hands which is disgusting over and over so they get pregnant. Then people drag their newborn calf away while the mother bellows for weeks. They kill the calf often just letting them die in a pile or smashing their heads. Some get to live in a crate to become veal or grow a little to become milk producers. They are beaten even sexually assaulted. Yes it's true. Underpaid workers often vent on these poor animals. The air is terrible and they are loosely regulated. Huge polluters these mega farms are. The air and the ground. All the irons and fecal matter gets spread around to eventually destroy rivers and streams. We should be getting off animal products as they are inhumane and unsustainable. People don't want this. Please do your research.

Watch some footage. It's not all about money.

It's a no

Jocelyn Bullock

Kimberly Ped **Letter 656**

Please do NOT allow this to be built. This is absolutely irresponsible and unethical in every way.

Briana Isiminger **Letter 657**

I vehemently oppose this. It is horrific.

The pollution from such a large number of cows is well documented. Not to mention, how would they ensure the humane treatment of over 18,000 cows and how would the state enforce this? Is there oversight for what will be done with all of the non milk producing calves born to these 18,000 cows?

Rylee Erickson **Letter 658**

I am submitting this comment in strong support of the West River Dairy expansion and the issuance of the NPDES Individual Feedlot Permit for this Project.

I have been around Riverview for 7+ years — from participating in their dairy heifer leasing program for 4-H, to benefiting from Riverview's Scholarship program and internship program, to now being a full-time employee. Through all of it, I have had nothing but full faith that Riverview is bettering agriculture and helping the communities where their sites are located. I have also lived in Swift County for 20+ years, where three of Riverview's sites operate. I have seen firsthand how this company conducts itself

as a neighbor and as an employer, and that experience matters to me when I say: this is a company that does things the right way.

The permitting process in Minnesota is extremely rigorous, and the submittal for this Project reflects that. The EAW and its attachments represent over 500 pages of research, analysis, and documentation — including not just internal work, but findings from independent third-party firms such as Barr Engineering for air quality modeling, American Engineering Testing for soil borings and groundwater analysis, Moore Engineering for a historic river flow study, and Agassiz Archaeology for a Phase I archaeological assessment. This is not a rubber-stamp process. It is a thorough, multi-agency review that involves the MPCA, the DNR, the Minnesota Department of Health, the State Historic Preservation Office, the U.S. Fish & Wildlife Service, and Stevens County — all of whom have been engaged throughout this process.

The facts documented in the EAW show a company that consistently goes beyond what is required. Manure storage capacity is designed at 14 months — more than 50% above the 9-month state minimum. The clay liners for the liquid manure storage areas will be 60 inches thick, triple the standard requirement. Stormwater basins are sized more than 20% larger than the minimum required for a 25-year storm event. Independent air quality modeling confirms that odor at nearby residences will remain below the threshold for even faint odors 100% of the time. And post-construction, the Project will actually reduce stormwater sediment discharge from 0.41 tons per acre per year to just 0.05 — leaving the watershed in better condition than it is today.

More than 16,500 acres of cropland have been identified for manure application — over 3,000 acres more than needed annually — providing a buffer that protects neighboring landowners and water resources. Every one of those acres was reviewed using DNR ecological databases, SHPO archaeological records, and state soil and water quality standards before being included.

I encourage all reviewers to take the time to carefully read what has been submitted for public notice. The depth and quality of this submittal speaks for itself.

I respectfully urge the MPCA to issue the West River Dairy expansion permit.

Thank you for your consideration.

Rylee Erickson

John Klein **Letter 659**

To create an area of 26,000 cows is an environmental disaster waiting to happen. Please do not approve such a blow to the average dairy farmer and their conservation practices.

Eric Smith , Flatland Custom Forage LLC. **Letter 660**

ATTN: Charles Peterson

Subject: Support for West River Dairy Expansion

My name is Eric Smith, and I own and operate Flatland Custom Forage LLC and Flatland Farms LLC in Cleveland Township, Lake Norden, SD (Hamlin County). I am writing today to express my full support for the proposed West River Dairy Expansion.

As a local business owner and farmer, my operation is deeply integrated with the dairy industry. We handle all the forage harvesting for Riverview's Garfield Dairy and grow a significant amount of corn and alfalfa specifically for their operations. Based on my direct experience, Riverview operates with an

unmatched level of professionalism and environmental integrity. Their facilities are impeccably maintained, and their team is dedicated to doing things the right way.

In my experience with agriculture in this region, I see firsthand that Riverview doesn't just follow regulations, they strive to exceed them. Whether it is nutrient management planning, soil testing, or precise application timing, their mindset is rooted in responsible stewardship. The use of manure as a nutrient source has provided clear benefits to our local land, improving soil health and organic matter while supporting long-term sustainability.

Beyond the environmental aspects, the economic impact on our rural community cannot be overstated. These dairies provide vital opportunities for the next generation of farm kids to return to the family business—opportunities that simply would not exist otherwise. My own business growth and ability to come back to the farm would not have been possible without Riverview's presence in our area. They reward those willing to work hard and commit to efficiency and quality; if you are dedicated to excellence, Riverview is a loyal partner that stands by your side.

I understand this project is undergoing a rigorous environmental review process. Based on Riverview's proven track record and the existing regulatory oversight, I am confident they will continue to operate responsibly. I believe the current review process is sufficient and that an EIS is not necessary.

I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion to continue supporting local agriculture and the families who depend on it.

Sincerely,

Eric Smith

Deborah Jindra **Letter 661**

I strongly oppose the expansion of the West River dairy due to the environmental and health risks, as well as the animal cruelty. There should never be this many animals in one spot and the pollution to our water and air is unacceptable in a state that values natural resources. Sensible animal husbandry can provide the needs to our community without using "factory" methods, which are inhumane and unworthy of Minnesotans. I will gladly pay more for my gallon of milk if I know that it is sourced from a responsible producer. I also reject the idea that this facility can deal with the massive amount of waste in a sustainable fashion. Please do not let this expansion proceed.

Julie Greenwood **Letter 662**

After reading through many comments, it appears that Riverview is a responsible corporation. That being said most of the positive comments are also from people who will directly or indirectly benefit from this expansion. My biggest concern is the environmental impact to the area, primarily water quality. The health and welfare of livestock, and the impact on smaller farms is also a concern. An EIS is definitely needed for a project of this size.

Laura Haule **Letter 663**

My concern is the enormous size of this project, which would seem to increase the impact on a variety of environmental factors. I think a full environmental review is warranted to evaluate the potential air and water pollution, soil and groundwater runoff, energy use, even noise pollution. I am concerned about animal welfare in a project of this magnitude.

Jerry Nelson **Letter 664**

ATTN: Charles Petersen

My name is Jerry Nelson, and I am a farmer in Norway Township, Roberts County, Veblen SD. I am writing in support of the proposed West River Dairy Expansion.

I've been growing silage corn for the East and West Marshall Dairy by Veblen SD for several years.

They have been applying manure on my land with awesome results for my crops. They soil test and send me results to share with my crop consultant. This allows me to manage my crop nutrient inputs effectively.

They have been instrumental in maintaining our township roads when needed because of wet fields, by graveling our roads where needed because of wear & tear from hauling silage.

I have experienced a better profit margin since I have been raising corn for the Marshall Dairy. This has been very beneficial for my operation, because I am not a large operation.

I am also a volunteer fireman. The Marshall Dairy has donated money for repairing our cement apron in front of the fire truck garage. Also donating money for our fundraisers.

I feel your community will benefit greatly from Riverview Dairy.

Sincerely, Jerry J Nelson

Connie Roche **Letter 665**

I am from Winona and was very aware of the Daley Farm request from Lewiston, MN to increase their dairy expansion. On the same vein, I believe this request would have a great impact not only on local farms but also the great possibility of manure run-off and contamination of groundwater and wells.

Having worked as a Public Health Nurse in Winona County, such a huge operation has health risks for the general population specifically that of bird flu and swine flu.

Treasuring our lakes in the state should be a high priority for all and contamination of our lakes and streams is not a route that we want to take.

Linda Vest Klein **Letter 666**

Please do not approve this expansion. It harms the water and air. It also harms the animals themselves through the inhumane, unnatural treatment of the living beings. And what is the purpose when there's a global OVERSUPPLY of milk?

Thank you for your consideration.

Brian and Betty Rinke **Letter 667**

This letter is being composed in support of the proposed West River Dairy Expansion. My name is Brian Rinke. My wife Betty and myself are residents of Dollymount Township. We live on a third generation farm located 2 miles from the Riverview Dollymount Dairy and are still actively farming mainly due to the opportunities that have been made available by having this facility in our location. We have become a smaller operation due to the fact that finding labor has become a significant issue. Being able to have our corn acres harvested for silage and receive manure for fertilizer has been a blessing allowing us to continue operating on a smaller scale.

We have been working with Riverview Dairy since 2017 and have nothing but positive things to say about this interaction. We have always been very impressed by the appearance and upkeep of the facility and grounds. To us, this only emphasis the organizational skills that are involved in making this happen. This also makes me more confident in Riverview's commitment to make sure that procedures are held in accordance with Minnesota regulations on manure and water management.

Riverview has been a very strong supporter of our community by investing in several of our local projects and organizations and always welcome and encourage any individual or groups to tour their facilities. They have helped us maintain and improve many of our township roads.

We are encouraging approval of the West River Dairy Expansion as we are confident of Riverview's commitment to operate within the necessary regulations. The environmental review should be a sufficient enough process without an unnecessary EIS.

Respectfully submitted,

Brian and Betty Rinke

Nick Hendrickson **Letter 668**

I live in Bryant South Dakota and we have a Riverview dairy 1 mile east of town and another one 4 miles west of town. It has been such a blessing having Riverview come to our area. Their sites are always so neat and clean. The employees are always a pleasure to work with. They have had such a positive impact on our little town. Here is a few things that come to mind. (They have staff that joined the local fire department and donate lots of time, they have donated so much to our local parks, they built several new houses in the area, they support the local businesses, they hire local contractors, they are one of the largest property taxpayers in our county, they attend and support all kinds of local events that happen). There is no doubt many more things that they have positively contributed to this area, and for what it's worth I hope they build many more in Hamlin County.

Micah Norman-Pace **Letter 669**

CAFO operations are harmful for not just the sentient animals who feel pain, fear, and stress, but is also bad for the workers and environment. Workers are often harmed through lax regulation of safety (see JBS plant strike and plenty of other documentation) and through the PTSD of slaughtering thousands of animals. The environmental conditions devastate the living conditions of surrounding properties and households, impacting water supply and breathable air. For me, no factory operation is ethical, but one of this size and scale are easy for all people to be against.

Peg Honkomp **Letter 670**

Being an organic home Gardner for over 50 years I know the importance of toxins, water health, and animal health! All affect my environment and what is done farther from my home DOES have affects locally.

The potential for overcrowding and disease is tremendous especially on a project this size. Open a separate farm somewhere else-they don't because it would cost the company more and lower profits all with no concern for the actual animals and the environment. We can and should do better for our State and health of our extended communities.

Thank you.

Dale Kennen **Letter 671**

I grew up on a dairy and hog farm in Chisago County Minnesota, graduated from the U of M College of Agriculture and worked as an investigator with the U.S. Food and Drug Administration for 30+ years. During those 30+ years, I spent 20 years in CA working alongside of USDA meat inspectors. We had a terrible time with cull dairy cows and male calves being sold for human consumption with residues of drugs and antibiotics in their meat. Those large dairy CAFO's could not, or would not, monitor the various drug withholding times to ensure that the animals were residue free before selling them for slaughter. They had too many other concerns to worry about humans ingesting drugs and/or antibiotics.

The disposing of the manure on these large CAFO's is, and will continue to be, a major concern and problem. The ground can handle only so much before runoff into waterways and seepage into aquifers takes place. And it is bound to happen when you have manure from thousands of cattle to dispose of.

I certainly hope that at the very least you require an Environmental Impact Statement before final decision is made. Otherwise the permit should definitely not be approved.

Rachel Scherf, Davis Immigration Lawyers **Letter 672**

ATTN: Charles Peterson

My name is Rachel Davis Scherf, and I am a Partner at Davis Immigration Lawyers PPLC, an immigration law firm serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a highly professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Rachel Davis Scherf

Michael H. Davis, Davis Immigration Lawyers **Letter 672**

Sandra Sween **Letter 674**

I do not think that large an expansion is necessary small farmers in the area would be impacted also bad environmental damage. neighbors near there would be subjected to noise and odor due to this expansion.

John Riley, John Riley Construction, Inc. **Letter 675**

ATTN: Charles Peterson

My name is John Riley, and I am the owner of John Riley Construction, a construction contractor that works alongside agricultural operations throughout Minnesota, including Riverview. I am writing to express my strong support for the proposed West River Dairy expansion in Stevens County.

Operations like Riverview play a key role in sustaining rural economies by creating jobs, encouraging local investment, and supporting the growth of businesses like ours that provide essential services to the agricultural sector. The planned expansion will deliver clear economic advantages to the area. It will increase opportunities for local suppliers and help strengthen the overall economic stability of communities that rely heavily on agriculture.

In our experience working with Riverview, they have consistently operated with professionalism and integrity. They are a trusted partner whose presence benefits not only agricultural producers but also a wide range of local businesses and service providers.

For these reasons, I strongly urge you to approve this project. Continued investment in agriculture is critical to preserving the strength and sustainability of rural Minnesota. Supporting this expansion will help ensure that local communities remain vibrant, economically stable, and well-positioned for the future.

Thank you for your consideration.

Sincerely,

John Riley

Lenny Stahl **Letter 676**

Agriculture must be supported, and projects like the proposed expansion of West River Dairy are important to the strength and future of rural Minnesota. Dairy farming is a vital part of our economy, our communities, and our food system. If we want agriculture to remain strong for the next generation, we need to support responsible growth opportunities like this one.

Based on the Environmental Assessment Worksheet, this project appears to have been carefully thought through with meaningful attention given to manure storage, water use, stormwater management, and land application. The covered liquid manure storage basins, clay-lined basins, water storage basins, and pumping limits tied to river flow conditions all show that this expansion is not being approached carelessly, but with planning and accountability.

Agriculture is already under enough pressure from regulations, costs, labor challenges, and public criticism. When a farm is willing to invest, grow, and follow the environmental review process, that effort should be recognized and supported. West River Dairy's expansion represents a major investment in agriculture, local jobs, and the rural economy of west central Minnesota.

I support this project and encourage the MPCA to allow it to move forward. Minnesota should be a place where responsible agricultural expansion is welcomed, not discouraged. Supporting this project is one way to support farmers, rural communities, and the future of agriculture in the state.

Mark Martens, Agri Placements International Inc **Letter 677**

On behalf of Agri Placements International Inc, I am submitting this comment regarding the draft Environmental Assessment Worksheet for the proposed West River Dairy Expansion in Stevens County.

Our company supports the continued development of Minnesota's dairy and agricultural economy, and we encourage the MPCA to complete a thorough review of the draft EAW and to ensure that any final approvals and permit conditions protect groundwater, surface water, air quality, and surrounding land uses.

We have a longstanding history of assisting Riverview in accessing its workforce, and the farm, in our experience, always focuses on "doing the right thing", taking care of people and animals, and improving conditions for all parties involved. We support allowing the project to proceed through the normal review and permitting pathway, provided the MPCA determines that applicable legal and environmental standards can be met and maintained.

Thank you for the opportunity to comment.

Brian D. Gjerde, I&S Group, Inc. **Letter 678**

c/o Charles Peterson

RE: Riverview Dairy – West River Dairy Expansion EAW Public Comment

I am writing on behalf of I&S Group, Inc. (ISG) in support of the Environmental Assessment Worksheet prepared for Riverview Dairy. Our firm has provided engineering services for Riverview Dairy at multiple locations, and we are familiar with their facilities, operational practices, and approach to environmental compliance.

Based on our direct involvement, Riverview Dairy consistently demonstrates a commitment to responsible project development, regulatory compliance, and proactive environmental management. The facilities and systems evaluated in the EAW reflect sound engineering design, use proven technologies, and follow established standards commonly applied to modern dairy operations in Minnesota.

The analyses and mitigation measures presented in the EAW align with industry best practices and, in our professional opinion, provide an appropriate and technically sound basis for evaluating potential environmental impacts. Through past projects, we have found Riverview Dairy to be responsive to agency input and willing to refine designs and operations to address environmental considerations.

For these reasons, we support the adequacy and conclusions of the EAW and believe it appropriately supports informed decision-making for the proposed project.

Thank you for the opportunity to submit comment.

Sincerely,

Brian D. Gjerde, PE

Mother Nature **Letter 679**

Hello, Many comments made during this public comment period point to Riverview being well run and following the Minnesota laws. No reason to argue with that. Many also then mention that because they are following Minnesota's laws, the environmental impact is reasonable. HA! That is where we need to dig a little deeper. Right now Minnesota does not require an Environmental Impact Study. Any time residents/ citizens have been successful (like Baker township 10-15 years ago) in requiring an Environmental Impact Study, Riverview has turned to other communities that are either desperate or lethargic enough to not ask if these feedlots impact their environment.

Common sense tells us that this many animals will have an impact, common sense also tells us the milk market does not need more milk. In a scenario like this we are just robbing peter to pay paul. Why not spend the time to see how these short sited economic decisions impact where we live?

Ann Hostler **Letter 680**

C/O Charles Peterson

Regarding: Public comment for proposed dairy expansion, West River Dairy, in Stevens County

Riverview LLP is proposing to expand in Steven's county (West River Dairy Expansion). I am a farmland owner 15 miles away from this CAFO.

It is important to study the impact of this expansion and requires an EIS.

We who own land know that pollution from these CAFOs are impacting our ground water, our land, health and our communities. The Pomme de Terre River watershed is within25 miles from its confluence with the Minnesota River, as an example. In addition, the Minnesota Department of Natural Resources does not have a complete map of Stevens County groundwater resources and aquifers.

Accountability is the job of MPCA. Do not allow this expansion based on unknowns.

EIS needs to be completed before expansion.

Sincerely,

Ann Hostler

Randy Dooley, Dooley's Petroleum **Letter 681**

To whom it may concern,

I am writing in support of the proposed 11,000 cow dairy feedlot in Section 1 of Synnes Township in Stevens County. As someone who works closely with agricultural producers and rural businesses, I believe it is important to recognize projects that strengthen our local economy while demonstrating responsible planning and long-term commitment to the communities they serve. Thoughtful agricultural development is essential to preserving rural vitality, and this proposal represents an opportunity to do exactly that.

One of the most meaningful contributors to that economy in Stevens County is Riverview Dairy. Riverview Dairy has made significant and lasting contributions to the local economy through job creation, capital investment, and ongoing support of local businesses. Beyond their economic impact, they have consistently demonstrated commitment to the communities in which they operate and have proven to be responsible stewards of the land and natural resources.

Dooley's Petroleum has been a fuel and propane provider to Riverview Dairy for several years. Through this business relationship, our company and employees have directly benefited from Riverview Dairy's growth and continued investment in the region. Their success supports not only agricultural operations but also local service providers, suppliers, and workers throughout the rural economy.

In closing, I believe Riverview Dairy's proposed expansion reflects the type of responsible agricultural growth that benefits Stevens County both now and into the future. Their track record of economic contribution, environmental stewardship, and community involvement demonstrates that they are a trusted partner in rural development. For these reasons, we respectfully express our support for this project and encourage decision-makers to recognize the positive impact it will have on our local economy, workforce, and agricultural sustainability.

Sincerely,

Randy Dooley

Dooley's Petroleum

Brandon Efraimson, Efraimson Electric Letter 682

ATTN: Charles Peterson

My name is Brandon Efraimson, and I am the owner Efraimson Electric, an Electrical Contractor serving agricultural operations in South Dakota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Brandon Efraimson, Owner

Jerry Lindor **Letter 683**

i do not think one farm should have thst many animal units on one site. A dairy farm this size would keep any young farmers from ever getting a chance to farm . They buy any land that comes up for sale and they increase the rent in the land they do not own . This country was built on small family farms .The communities suffer when u have these mega farms . The churches will close the schools will close because they control all the land and they chase everyone away . If we have to have these big dairy farms let's at least spread them around do they don't completely dominate the community. Thsnk you Jerry Lindor

Tom Walsh **Letter 684**

To whom it may concern

I have had the opportunity to live very close to several riverview sites and wittnes first hand all of the activities

Animal care

Environmental stewardship

Neighbor relationships

Community interactions

The list is long and from what I see it's top notch

I am involved with riverview so it might seem like my comments are biased but my family has been in this community for generations and I hope to continue that on to the next so I would never be a part of something that would put that in jeopardy

Since this is a environmental issue as far as the mpca goes I can tell you that having livestock in the area is a good thing for the environment

And many safe gaurds are In place to insure that Livestock farms of all sizes are such a important part of our rural communities

Please consider your decisions carefully and understand that we have very good environmental protection rules already in place to protect our great state and rural communities

Thank you for your consideration

Judith Riley **Letter 685**

Thank you for this opportunity to comment on the West River Dairy Expansion.

I am not a farmer. I have never even milked a cow.

While I care about the environment and the impact a particular operation might have on it, my knowledge and experience with this type of issue is minimal at best.

What I do know, with more than 50 years of experience working with a variety of individuals and businesses in the area of public relations and communication, is whether or not those individuals or businesses have integrity, work and operate responsibly, and consider the effect they have on those around them.

My knowledge of Riverview comes from an entirely different perspective. I am a townhome owner in one of the many Morris neighborhoods that Riverview is developing. In my experience working with Riverview as they construct and manage new properties in our townhome community, I am impressed even on this small scale with Riverview employees' concern about the impact that their presence has on the existing homeowners. They have consulted with us and included us in the conversation as they build new townhomes in our neighborhood.

In an effort to further understand how this expansion might affect area farmers and land owners, I have talked with both farmers and county officials to get their perspective. To a person, they are not concerned about the impact this expansion would have on the environment.

I have no doubt that Riverview would operate this new facility with the same care and integrity for which they are already known.

Jackson Walsh **Letter 686**

ATTN: Charles Peterson

My name is Jackson im in grace township chippewa county. We farm around 3 riverview dairies. Additionally I am a supervisor for the township. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the region— and provides adequate oversight for this project.

Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Thanks

Jackson Walsh

Kay Erickson **Letter 687**

I'm opposed to this expansion. Cows treated like factory producers, mega amounts of manure, just the thought of it makes me worried about polluting our lakes and rivers. It needs to be denied.

Nora Hultgren **Letter 688**

I am currently a senior at MACCRAY High School and have spent the last few summers working at the Riverview facility next to my home. I help weigh and grade alfalfa brought in to the dairy from fields around our community four times a summer. I am not an employee of Riverview, I work for the harvesting contractor that my dad is a partner in.

My experience with Riverview has been nothing but great. The employees are respectful and friendly, the site I work at is clean and organized. I have observed the degree of detail that the Riverview workers observe when they care for the lawn and roads by the site and they are immaculate. I've been on smaller livestock farms of some of my other neighbors and they are not nearly as clean or organized.

Riverview has a company program called "Be Kind" and another called "Be Safe". They stress animal welfare and worker safety every day. In all my time being there, I have never seen unsafe behavior or any workers being disrespectful to each other or the cows. The barns are clean, comfortable, and quiet. The cows are happy!

I would definitely recommend approval of a permit to expand West River Dairy as there is nobody better than Riverview when it comes to taking care of dairy cows and living up to the expectations of our communities!

Noah Hultgren, Fieldstock Realty LLC **Letter 689**

I am submitting this comment in regard to the West River Dairy permit. I am in 100% support of the expansion. Being a realtor in a rural area, I can tell you that Riverview's projects between Morris and Willmar have done nothing but bring more activity in an otherwsie stagnant rural sales area. Their sites have caused no negative effects on neighboring properties because they keep them clean and well-maintained.

Anyone that lives in an urban area and is writing comments on the dairy's effect on our rural area should be taken with very little credit.

I can also attest to the positive effects of the addition of more alfalfa in our region and it has reduced wind and water erosion while improving soil health. Farmers here have appreciated the opportunity to have manure applied to their land, and the applicators follow state-mandated setback rules when they apply the manure, staying a safe distance away from open ditches and other bodies of water.

I have observed nothing but the best when it comes to Riverview and I support their permit application.

Blake Klaphake **Letter 690**

I am writing this letter in support of Riverview's expansion at West River Dairy.

When I think of continued growth of the dairy industry in Minnesota, I think of three important factors for success: worker safety, environmental responsibility, and animal welfare. Riverview is the gold standard in all three.

Their "Be Safe" and "Be Kind" initiatives focus on worker safey and animal care. They have a special "SWAT" team that helps their workers anytime there's a special circumstance with any injured animal--if an employee doesn't know how to handle a cow that has a health condition, the team is called in and is specially trained for handling cows in any difficult situations. They are organized, well-trained, and respectful to the animals.

I work on a neighboring farm and deliver corn and other products to Riverview's dairies. The sites are clean and well-maintained. I have observed them applying manure on our farm and they follow state guidelines for rates and for maintaining proper setbacks from the ditches.

They recently built a water capture pond to conserve water on the site. This is so they don't have to use as much groundwater. They recycle water that they use to wash cows. They also recycle bedding so they use far less per cow than your average dairy.

Riverview has been a huge benefit to our local communities, and the farmers that farm around the sites are very happy with the opportunity. NOt only can they sell crops to the dairy, it also means they're not wasting fuel and labor and time shipping corn and hay 20 miles down the road.

I highly support this permit application.

Emily Boecker **Letter 691**

It is vital that the Riverview Dairy be required to submit an environmental impact statement. It is nearly twice as big as any current operations in the state, and its environmental harm would be enormous. Here's what we know now.

Massive water use: Riverview would pump up to 226 million gallons/year from an off-site well—nearly as much as the entire City of Morris (permitted for 300 million gallons/year for 5,000+ residents).

Huge waste output: The facility would generate about 202.7 million gallons of liquid manure and wastewater annually, plus 26,400 tons of solid manure.

Unknown groundwater impacts: The DNR hasn't begun the hydrologic survey or completed the County Geologic Atlas for Stevens County, so aquifers and groundwater resources aren't mapped—making it risky to permit large withdrawals now.

Sensitive, already-impaired waters: The expansion sits in the Pomme de Terre watershed, designated sensitive; the nearest waters—the Pomme de Terre River and a nearby unnamed creek—are already listed as impaired. The project would likely worsen these impairments.

Advancing permits without a full understanding of groundwater and water-quality risks is irresponsible.

It is critical that the MPCA require a full Environmental Impact Statement.

Kennedy Stegner **Letter 692**

Riverview should be required to complete an environmental impact statement regarding this proposed facility. The people of Morris deserve a clear statement on the effect this operation will have on our water supply in both availability and quality. This facility will also be near the Pomme de Terre watershed, part of Stevens County's Soil and Water Protection District, and so many more protected spaces.

Not only is this a threat to our water, this is a threat to local farmers. This large of a facility will have major impacts on smaller dairy farms in the area. We need to consider the long term effects of this expansion.

Kennedy Stegner

Sandra Yost **Letter 693**

My name is Sandra Yost, a neighbor to river Riview Dairy and live in Dublin township. I am writing in support of the proposed West River Dairy expansion.

We have seen, close up the way Riverview operates. You will not find a business that operates with more professionalism, integrity or environmental responsibility. All of their facilities are the exemplary, all you have to do is drive by one of the sites and you will see how committed they are to doing things the right way.

They follow the manure and water regulations as regulated by the state of Minnesota and go above and beyond. Local farmers benefit by the use of manure as a natural fertilizer on their fields., supporting long term sustainability.

Riverview has been a community partner, for farmers, creating jobs, maintaining roads and supporting schools and local programs.

Based on Riverviews track record, I believe that the rigorous review that is in place is sufficient and additional regulatory burdens are not needed.

I strongly support the approval of West River Dairy Expansion,

Sandra Yost

Jeffrey Davis, Bryant State Bank **Letter 694**

ATTN: Charles Peterson

RE: Riverview LLP, West River Dairy Expansion in Stevens County MN.

Dear:

Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

I am the president and CEO of a community bank in Northeast South Dakota. Riverview has dairies within 30 miles of our bank; we have several customers that are able to expand and exist because of the presence of Riverview. I have been on several of their dairy properties and find them to be very professional and extremely clean and well maintained.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota as well as South Dakota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

The state environmental review process is rigorous and sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Jeffrey J Davis

President – CEO

Nate Skindelien, Duninck Concrete **Letter 695**

I am writing to express my strong support for the Riverview Dairy expansion project. I have had the opportunity to work alongside Riverview for the past ten years, and during that time I've come to know not just their operations, but also the people and values behind them.

One of the things that stands out most is their commitment to local communities. Their construction projects consistently use local contractors, creating dependable work for small businesses and skilled workers who truly rely on these opportunities in rural areas. The impact of that kind of investment is both real and lasting.

I have also seen how Riverview works with neighboring farmers. Their partnerships for supplemental feed and manure fertilizer programs create strong, mutually beneficial relationships that support local agriculture as a whole. They are not just operating in these communities—they are actively contributing to their success.

Riverview's care for the land and their facilities is another reason I support this project. They take pride in doing things the right way, and it shows. Their operations are well managed and thoughtfully maintained, to the point that other dairy producers often look to them as an example of how things should be done.

What has impressed me most over the years, though, is how much they value people. That mindset is clear from leadership all the way through their teams, and it extends beyond their organization into the communities they are part of. They treat people with respect and genuinely care about doing right by others.

Projects like this expansion are important for rural communities. They bring jobs, economic growth, and long-term stability to areas that need it. From what I have seen over the past decade, Riverview approaches that responsibility with care and integrity.

For all of these reasons, I strongly support the Riverview Dairy expansion project and respectfully encourage its approval. I am confident it will continue to reflect the same standards and values I have consistently seen over the years.

Thank you for your time and consideration.

Sincerely,

Nate Skindelien

Gail Morris **Letter 696**

I live by Lake Reno in Pope County just a few miles from Alexandria. Alexandria already had a child die of toxic lake algae exposure.

It is actually hard for me to imagine a dairy herd of even a 100 cattle. I'm 80. I grew up milking a few cows. Of course, those days are gone!

However, contemplating over 18,000 dairy cattle raises my every instinct of danger and fear.

*Danger to our Public Health and Natural Resources: where in this world/landscape does all that daily manure, poop and urine of 18,885 cattle go? Toxic poison in our lakes and streams? Poop stinks. 18,885 Cows everyday. Oh my gosh, I bet that's wonderful on a hot stifling day in July. Every day.

*Danger to our Animal Welfare: Yes we need to feed the world. Yes, we need to maximize our dairy industry. It can never be "like it was". But factoring 18,885 dairy cows into one facility is cruel. Cleanliness alone is huge. Danger of Viral Disease is Huge.

But just a few miles from me on Lake Reno we already do have a huge cattle feedlot.

William Bosch **Letter 697**

To whom it may concern,

My name is Will Bosch, and I have the pleasure of farming with my family near several Riverview dairy farms. I have also worked as an intern at Riverview farms in the past, so I have first-hand experience of how Riverview conducts business and manages its farms. I am writing to express my strong support for the West River Dairy Expansion.

Environmental concerns are always top of mind for Riverview management and employees, alongside their strong culture of employee safety, animal welfare, and good neighborliness. More than any other dairy or agricultural operation that I have knowledge of, Riverview is well equipped and pro-active in its efforts to mitigate any negative environmental impacts that may result from its operations. For example, all manure, wastewater, and runoff from feed pads is first recycled if able, then collected and redistributed to the surrounding land as nutrient dense fertilizer in a safe and proper manner. This serves to add economic value to surrounding farms like my family’s as well as mitigating environmental concerns by reducing the amount of commercial synthetic fertilizer needed to grow bountiful crops.

Beyond environmental concerns, the West River Dairy Expansion represents a significant boost in demand for locally grown crops, adding to the economic impact that agriculture has on our part of the state. Additional dairy production in our area serves to fill a large demand for nutritious whole foods in our state, country, and world. Livestock has always been an important aspect of a sustainable agricultural system, returning nutrients to the soil as well as turning row crops into value added ag products, and every effort should be made to allow the growth of this industry in MN’s rural areas.

Lucas Sjostrom, Minnesota Milk Producers Association **Letter 698**

To: Charles Peterson, Minnesota Pollution Control Agency

From: Minnesota Milk Producers Association Board of Directors

The Minnesota Milk Producers Association appreciates the opportunity to comment on the Environmental Assessment Worksheet (EAW) for the West River Dairy expansion. As an organization dedicated to the success of Minnesota's dairy farmers, our focus remains on ensuring that the state's regulatory frameworks are applied consistently, fairly, and based on sound science.

Support for a Science-Based Regulatory Process

We encourage the MPCA to maintain its commitment to a science-based and data-driven process. The current environmental review for this project is comprehensive. We believe the existing regulatory tools—including the EAW and the potential for individual permits with specific conditions—are sufficient to ensure the protection of Minnesota's water and natural resources.

• Proper Jurisdiction: The environmental review process is designed to assess significant environmental impacts, not to dictate public policy regarding the size or structure of dairy farms.

• Legislative Authority: We believe the Minnesota Legislature is the appropriate body to determine broader economic policies that support the dairy industry and its farmers.

• Regulatory Integrity: Utilizing the environmental permitting process to address economic competition issues is inappropriate and risks undermining the integrity of the state's regulatory system.

Conclusion

Minnesota's dairy sector thrives when there is a transparent, predictable, and rigorous permitting process. We support the MPCA's use of the established EAW process to evaluate this project and encourage a final decision based on the technical merits and data presented throughout this review.

Travis Holmgren **Letter 699**

ATTN: Charles Peterson

My name is Travis Holmgren, and I am an employee of a milk processing plant in Minnesota. Agricultural operations in Minnesota like Riverview provide an economical benefit to myself and my family. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview’s create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient.

I respectfully encourage your support and approval of this important project.

Sincerely,

Travis Holmgren

Fabian Hernandez **Letter 700**

ATTN: Charles Peterson

Support for Proposed West River Dairy Expansion

To Whom It May Concern:

My name is Fabian Hernadez. I am a neighbor in Stevens County, and I am writing to express my support for the proposed West River Dairy Expansion.

From what I have observed, Riverview Dairy is operated with care and accountability. The facilities are orderly and well maintained, and staff consistently demonstrate a commitment to safe and responsible day-to-day practices.

I also understand that Minnesota has clear requirements for manure management and water use. Based on my familiarity with agriculture in this region, I recognize the importance of nutrient management planning, soil testing, appropriate application rates, and timing that reflects field and weather conditions.

Riverview's approach appears aligned with those expectations, with an emphasis on meeting—and where possible exceeding—state standards for stewardship.

When managed correctly, manure provides a valuable nutrient source for crop production. It can build soil organic matter, support soil structure, and help reduce erosion—benefits that contribute to long-term farm productivity and sustainability in our area.

Beyond operations, Riverview has been an active community partner. Their presence supports local jobs and area farmers, and they have contributed to community needs such as roads, schools, and local programs. Just as important, they have shown a willingness to communicate and work with neighbors and local officials.

I understand this project is being reviewed through Minnesota's established environmental review and permitting processes, which provide meaningful oversight and accountability. Based on the information available, the existing regulatory framework, and Riverview's track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

Thank you for the opportunity to provide public comment. I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion.

Sincerely,

Fabian Hernandez.

Gene Ward, Webtomix, LLC — Letter 701

Subject: Public Comment regarding Riverview, LLP - MPCA Feedback

To the Minnesota Pollution Control Agency,

I am writing today as a local business owner in Pennock & Kerkhoven to provide feedback regarding our long-standing professional relationship with Riverview Dairy. In the current climate, it is easy for the broader public benefits of a local organization to be overlooked, and I want to share the perspective of a technical partner who sees their community impact firsthand.

My company, Webtomix, provides IT and network infrastructure services. Riverview Dairy has been our primary business partner for nearly a decade. For a small technology firm in rural Minnesota, a partnership of this scale is more than just a contract; it is a cornerstone of our business stability. Their commitment to utilizing local tech services has allowed us to:

- **Invest in the Local Economy: Their consistent business has enabled us to maintain a physical presence in the community, including our recent expansion into a new office in Kerkhoven.**
- **Support Local Infrastructure: By prioritizing modern, efficient network systems, they are bringing high-level technical standards to our small communities-infrastructure that might otherwise be reserved for larger metropolitan areas.**
- **Sustain Local Jobs: The volume of work they provide-from comprehensive hardware upgrades to daily network management-directly supports the livelihoods of those we employ right here in the region.**

Beyond the technical side, we have found them to be a partner that genuinely values the people they do business with. They are a significant driver of the economic health of our small towns, and their presence ensures that local service providers like Webtomix can continue to grow and serve this area.

We value their partnership immensely and hope that the agency considers these vital economic and community contributions during this feedback process.

Sincerely,

Gene Ward Owner Webtomix, LLC

Karen Stettner **Letter 702**

I am opposed to this project because of the large number of animals they plan to have. Air quality, water quality and water availability should all be addressed. A feedlot of this size will impact residents many miles in every direction from the feedlot i.e. Smell. There should be environmental studies carried out by State and Federal agencies. Please deny this permit request from Riverview Dairy.

Carol Wenner **Letter 703**

The West River dairy expansion will be too taxing on our environmental resources. I say no!

David Huang, SeaTac Packaging **Letter 704**

I am writing in support of Riverview LLP's proposed West River Dairy expansion in Stevens County.

Ruth Lovander Foley **Letter 705**

I am respectfully submitting my comments about corporate farming. I oppose West River Dairy expansion as the proposed size of the expansion will be unable to keep environmental safety, is extremely damaging to small family dairy operations and is cruel to the dairy animals. I grew up on a family Holstein dairy operation. Animal husbandry was always practiced on our farm. Our cows were milked two times per day. Between the morning and evening milkings, our cows were let out of the barn to feed on pasture grass and get fresh air and sunshine for the health of the animals. Animals on these corporate farms are denied fresh air and are merely MACHINES for continued breeding until they are physically exhausted. Then they are disposed of (which SADLY may be the best part of their lives). We surely owe our domesticated animals much more empathy than this! When did we begin to put corporate profits above concerns for family farmers and the animals we are entrusted to care for? The tradeoffs for the benefit of huge corporations and their owners/shareholders should not override all other concerns! Please deny all corporate farms in Minnesota the ability to expand and - even to exist.

Amy Ekren **Letter 706**

As a business owner in this community, I want to speak in strong support of the West River Dairy expansion.

I run a company that depends on a healthy, functioning local economy. Agriculture is not just part of that, it is the backbone of it. When farms grow, our communities grow. We see it in jobs, in families staying local, in small businesses being able to operate and expand.

This project represents long-term investment in our county. It supports not only those directly involved in agriculture, but also the ripple effect of suppliers, service providers, and local businesses like ours who rely on a stable and growing customer base.

I understand that growth brings questions, and those should be handled with care and responsibility. But choosing not to grow has consequences too. Without forward movement like this, rural communities risk losing momentum, opportunity, and the next generation.

From both a business and stewardship perspective, I support this project. Thoughtful expansion, done well, is how we build something that lasts...for our families, our employees, and our community.

I believe we are called to be good stewards, not just of land, but of opportunity. This project is part of building a future where people can live, work, and thrive here. I fully support it.

Anthony Ekren **Letter 707**

As a local business owner and community member I am writing in strong support of the proposed West River Dairy Expansion. What must be considered alongside environmental review is the very real and measurable economic and community impact of this dairy farm. For over 30 years, Riverview has contributed to the strength and stability of our local economy in Stevens county. Businesses like this do not operate in isolation. They support local suppliers, create jobs, sustain families, and drive consistent economic activity that allows other small businesses, including my own, to grow and thrive. When agriculture is strong, our entire community benefits. Schools, churches, service providers, and local retailers all feel the ripple effect of a stable, productive agricultural base.

Expansion is a sign of health, stewardship, and long-term investment in our county. It reflects a commitment to doing business here and continuing to provide opportunity for future generations. West River Dairy is a well-managed dairy that has already demonstrated over 20 years of positive presence in both the environment and local economy. I respectfully encourage decision-makers to consider not only the environmental data presented in the EAW, but also the proven track record and the broader community impact this dairy farm has had and will continue to have.

Respectfully,

Anthony Ekren

Talia Koehl **Letter 708**

As a Stevens County resident, I am in support of Riverview's expansion project & I don't believe that the EIS is necessary. Knowing who Riverview is & how responsible they are with their resources, I am in full support of the West River expansion.

Trenton Nelson **Letter 709**

I am submitting this comment to urge the rejection of the proposed livestock facility expansion. A facility of this size creates an unmanageable amount of waste that threatens Minnesota's groundwater and local ecosystems. Beyond the environmental impact, I am concerned about the welfare of the animals involved and the degradation of the surrounding wild animal habitats. We should be moving toward more sustainable and ethical agricultural practices, not doubling down on industrial factory farming.

Kendall Waldbeser **Letter 710**

My name is Kendall Waldbeser, and I am writing to express my strong support for the proposed West River Dairy expansion.

I have lived in close proximity to this project area for my entire life, and with the proposed expansion, my home will be located within approximately one-half mile of the dairy.Because of that, this project is very personal to me and my family.

I have also been connected to Riverview for many years and have had the opportunity to observe their operations firsthand over time. Through that experience, I have seen the level of care, responsibility, and attention to detail that goes into how they manage their dairies.

From an environmental standpoint, I have a high level of confidence in Riverview's practices. I have personally observed their commitment to responsible manure management, including thoughtful application practices that support local crop production while protecting the land. I have also seen their approach to water management and conservation, as well as the steps they take to maintain clean and orderly sites.

Additionally, Riverview has demonstrated a strong commitment to being a good neighbor. This includes maintaining roads, managing tra□ic responsibly, and taking proactive measures such as using synthetic covers on manure lagoons to mitigate odor.

Just as important, I have paid close attention to the environmental review process for this project. It is clear to me that both the MPCA and the Minnesota Department of Natural Resources (DNR) have conducted a thorough, rigorous, and exhaustive review. As someone who lives nearby and will be directly impacted, I am fully confident in the strength and integrity of this process.

Based on my lifelong proximity to this area, my firsthand knowledge of Riverview's operations, and my confidence in the review conducted by the MPCA and DNR, my family and I are completely comfortable with this project moving forward.

For these reasons, I respectfully ask that the MPCA approve the West River Dairy expansion. I also believe the Environmental Assessment Worksheet (EAW) process has been comprehensive and su□icient, and that an Environmental Impact Statement (EIS) is not necessary.

Thank you for your time and consideration.

Sincerely,

Kendall Waldbeser

Michael Green **Letter 711**

ATTN: Charles Peterson

My name is Michael Green and I am an employee of RSP Design Inc serving dairy processing operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the dairy sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Michael Green

Wendy Evink **Letter 712**

Dear Commissioner Kessler and MPCA Staff,

I have lived in Stevens County my entire life, and I care deeply about what happens here — to the land, the water, and the people who call this place home. I am writing in strong support of the proposed West River Dairy expansion near Morris.

I'll be honest — I'm not an expert in water management or nutrient regulations. But I've asked a lot of questions over the years, and I've listened carefully to the people who are. What I've come to understand is that the Environmental Assessment Worksheet process the MPCA requires is no rubber stamp. It digs deep. And what Riverview has laid out in this application — from how they handle manure as a soil-building resource rather than a waste product, to how they capture and reuse rainwater runoff on-site — tells me this isn't just about meeting the minimum. Our land and water won't just be protected under this plan. From what I've learned, they stand to genuinely improve. That's not something I expected to be able to say, but the more I looked into it, the more I believed it.

To me, this is what good regulation is supposed to look like — when the rules, the operator's commitment, and smart thinking about the land all come together in the same place at the same time.

What means the most to me personally is what this operation has meant for my family and so many others like us. One of my children was able to come back home, find good work, and raise a family here because of the kind of economic foundation that operations like West River Dairy help provide. That is not a small thing. Keeping rural communities like ours alive depends on being able to offer that to the next generation.

The environmental review process has been thorough. Riverview's track record speaks for itself. I respectfully urge the MPCA to approve this expansion — it's good for our land, good for our water, and good for the future of this community.

Sincerely,

Wendy Evink

Chad Seizert **Letter 713**

The West River Dairy expansion should not be approved. Throughout Minnesota, and the whole nation, family farm operations and small scale independent agricultural enterprises are being squeezed or out and out destroyed by the large scale industrial model of agriculture, in the name of increased efficiency and profitability for stakeholders. The degradation of the land, ground water, air, and habitats are externalities that are invariably left for the community or state to deal with. The industrial model of agriculture devastates their local economies resulting in impoverished and dying small towns with few prospects for people in those regions. Ethically, there is much to oppose this feedlot expansion, from the inhumane treatment of the cows and their offspring, to the questionable treatment of the employees who do not reap the economic benefits that these factory operations provide to the few. Contrary to Riverview's self promoted stewardship of the environment, it should be plain to everyone that all of that manure has to go somewhere, and there are no benign disposal options.

Ron Schlueter **Letter 714**

Hello,

Please include my name in those that OPPOSE the expansion of the West River Dairy!!! This enlargement project is just too large for the area. Often, we hear of large dairy operations that have manure "leaks" that pollute the area. We also have polluted ground water and lakes that have also been impacted by these "accidents". We have a cabin in an adjacent county and would hate to have this expansion set a precedent in additional areas of the state.

Please oppose this expansion!

Robert Valnes **Letter 715**

To whom it may concern,

I have lived and worked in Stevens County my entire 83 years, and have been in the well drilling and water conditioning business for over 50 years. I know this ground. I know what's in it, what flows through it, and what it takes to protect it. I am writing in strong support of the proposed West River Dairy expansion near Morris.

Some people are throwing out big numbers about water usage and manure to scare folks who don't deal with these things for a living. I understand why it works. But I do deal with them, and I can tell you that a big number without context doesn't mean much.

The DNR does not hand out water permits because somebody asks nicely. They look hard at aquifer capacity, existing water users, and long-term sustainability before a single gallon can be appropriated. I have worked alongside that process for decades. It is not a formality. If the water couldn't support this in a sustainable way, the permit wouldn't be granted. Period.

The same is true on the manure side. The MPCA requires detailed nutrient management planning tied to actual field capacity, soil testing, and application timing. Done right, it's not a liability — it's an asset to the farmland surrounding this operation. I've seen it with my own eyes over many years.

I wouldn't be writing this if I had any doubt about what this project means for our water and our land. I've spent my whole life trying to protect both and that's not something I would set aside for anyone.

But this is about more than water and land. People need to understand what an operation like this means for the local economy. Construction alone brings real work to local contractors, electricians, equipment operators, and suppliers. Once it's running, the ripple effect doesn't stop — those same service providers, along with farmers providing feed, harvest crews, and truckers all see activity that wouldn't exist otherwise. That is real money staying right here in Stevens County.

I've lived a good long life in this county and I have no complaints about that. But my biggest hope at this point isn't for myself - it's that the people coming up behind me have the same opportunities I did, and then some. Projects like this one, done the right way and with the right oversight, are how that happens. That's what I care about now.

I respectfully urge the MPCA to approve this expansion. Don't let large numbers without context cloud a process that has been done right. This community deserves the opportunity to grow, and this is the right way to do it.

Sincerely,

Robert Valnes

Shane Seeger **Letter 716**

I recently began working as a contractor on a Riverview Dairy project, and it's immediately clear they operate to an exceptional environmental standard. Their farms are consistently clean, well-managed, and thoughtfully run, with practices that reflect genuine care for sustainability, animal welfare, and responsible agriculture.

Riverview Dairy is a strong example of modern, environmentally conscious farm management.

Based on what I've seen, I'm confident the new facility will be maintained with the same level of cleanliness, care, and professionalism

Sammy Glanzer **Letter 717**

ATTN: Charles Peterson

My name is Sammy Glanzer and I am a neighbor/local resident/farmer/business owner/official in Fordham Township in Clark County I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are wellmaintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship. The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports longterm agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor. I understand that this project is undergoing environmental review through the state's established process — one of the most rigorous in the

region— and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely

Sammy

Steven Glanzer **Letter 718**

ATTN: Charles Peterson

My name is Steve Glanzer and I am a neighbor/local resident/farmer/business owner/official in Fordham Township in Clark County I am writing in support of the proposed West River Dairy Expansion.

Sincerely

Steve

Holly Grap **Letter 719**

Riverview does not have Minneostans in mind for this expansion. They do no support community farmers, and this expansion is an ecological disaster waiting to happen. Riverview has already had manure leakage in a manure storage tank, and their hog and dairy farms use at least 570 million gallons

of water annually. The proposed expansion would pump and store up to an additional 226 million gallons. We do not need to sacrifice our fresh water for these massive factories. Please vote no. For our water. For our future.

Adam Redlinger, Redlinger Bros. Plumbing & Heating Co. — Letter 720

ATTN: Charles Peterson

My name is Adam Redlinger, and I am the owner of Redlinger Bros. Plumbing & Heating Co., a plumbing and mechanical contractor serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities. We have been working with dairy producers and dairy related companies such as Riverview, Valley Queen Cheese (SD), Green Meadows (IA), Agropur (SD) and Bel Brands (SD) and without the stability and future growth of companies in this sector, we wouldn't be in business today. The dairy sector has helped our business survive slower years and even grow while other businesses in construction struggled.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses. We have a positive experience of working alongside Riverview and its employees.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Adam Redlinger

David Munn — Letter 721

This expansion is very concerning. A project of this size should require an environmental impact statement. The citizens of Minnesota should be able to expect this level of oversight from the MCPA.

Thank you

Jackie Junker — Letter 722

To the Minnesota Pollution Control Agency,

I am writing as a concerned citizen regarding the proposed West River Dairy Expansion in Stevens County. While I understand the importance of agriculture to Minnesota's economy, I have serious concerns about the scale of this project and its potential impacts on both animal welfare and the environment.

An operation of this size, housing nearly 19,000 dairy cows, raises significant questions about the humane treatment of animals. Industrial-scale dairies often limit natural behaviors, increase stress, and can lead to higher rates of injury and illness if not carefully managed. I urge the MPCA to closely evaluate how animal welfare standards will be maintained at this facility and whether current oversight is sufficient at this scale.

Additionally, the environmental risks are substantial. Large dairy operations produce enormous quantities of manure, which can threaten groundwater, surface water, and air quality if not properly handled. In a rural area like Stevens County, where many residents rely on well water, the potential for contamination is especially concerning. Odor, emissions, and nutrient runoff could also negatively impact nearby communities and ecosystems.

I respectfully ask the MPCA to ensure that this Environmental Assessment Worksheet fully and transparently addresses these concerns, and to require the highest standards of environmental protection and animal care before any permits are considered.

Thank you for the opportunity to provide input and for your commitment to protecting Minnesota's environment and communities. Jackie

Todd Malecha **Letter 723**

Hi My Name is Todd Malecha,

We are life long residents of Pope County and life long multi Generational dairy farmers. I am writing in support of Riverview LLP's proposed West River Dairy expansion in Stevens County.

My support is based on belief that Riverview has shown itself to be a serious capable agricultural operator and an important contributor to West-central Minnesota.

For my perspective, this proposal should not be reduced to a simple debate of Big versus small. This is about whether a company with experience resources and long-term stake in the area should be allowed to invest in the future. Riverview's presence supports jobs, local businesses schools, and neighboring farms. It also reflects a family business, choosing to contribute and investing in Minnesota rather than taking the investment elsewhere. In short, I support the West River Dairy expansion because I believe Riverview is a strong operator, an important economic partner in the region and a company willing to make substantial long-term investments in Minnesota communities. I respectfully ask the MPCA to give this project a fair review and let the science, the engineering and their records speak for themselves-thank you for your time and consideration sincerely Todd Malecha.

Jane Amberg **Letter 724**

I am not in favor of the proposed West River Dairy Expansion. My three main reasons include animal welfare, manure runoff with all the environmental concerns associated with that and I oppose factory farming.

Gabi Joos **Letter 725**

To whom it may concern,

I strongly support the proposed expansion of the West River Dairy in Stevens County. This project represents a meaningful opportunity to advance both the dairy industry and the broader agricultural community in our region. As a former employee of Riverview LLP, I have had the privilege of witnessing firsthand the depth of research, planning, and diligence that goes into evaluating the feasibility of a new

dairy. Every aspect, down to individual animal units, is carefully analyzed, reflecting a thorough and time-intensive process that prioritizes both sustainability and operational excellence.

As someone deeply connected to agriculture and passionate about advocacy, I believe in supporting farmers and organizations like Riverview, whose mission centers on strengthening the industry and addressing critical gaps. While concerns are sometimes raised about the impact of expansion, such as increased manure production, it is important to recognize that manure is a valuable resource. When managed responsibly, it serves as an essential nutrient source that supports neighboring farms, many of which are smaller operations that benefit from these partnerships.

My personal experience with Riverview, from employment during high school and college to being a recipient of the Riverview Connect Scholarship, has shown me the organization's genuine commitment to its employees, local communities, and agricultural partners. Their investment in people and their emphasis on opportunity set them apart as a company that adds long-term value wherever they operate.

For these reasons, I fully support the West River Dairy expansion. It is a project that not only contributes to the continued growth and sustainability of local agriculture but also reflects the values of a company that consistently demonstrates integrity, innovation, and community engagement.

Sincerely,

Gabi Joos

Mike Deseth **Letter 726**

After review and research of this situation and reading many of these comments, if this expansion is such a benefit for the community, no one should be afraid to do an EIS. Many commenting in support seem to be businesses involved directly with Riverview and others related to the business which is not impartial by any means. One can have the best intentions and character but deeper study can only assist with determining if this huge expansion is right for our area at this time.

Looking at Riverview's history in SD, ND, AZ and their ND impacts into Canada- there seems to be some strong opposition to projects already completed and also those with permits for expansions ready to be started. Some have been met with legal opposition. It would seem wise of MN to look a bit deeper into this now than pay a price later. I would be concerned about water usage and the overall water tables ability to trend through changing environmental impacts as well as where expansion stops. Two major Riverview locations are already situated approximately 12 miles near each other, one being another currently expanding to offer milk plant service. Thank you for your time. Mike Deseth

Kevin Mills, Pinion **Letter 727**

My name is Kevin Mills, and I am a Principal of Pinion, a Consulting and Accounting Firm serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Kevin Mills

Samantha Deseth **Letter 728**

To Whom It May Concern,

I am a resident living within a few miles of the proposed West River Dairy expansion in Synnes Township. I am writing to respectfully request that the Minnesota Pollution Control Agency require a full Environmental Impact Statement (EIS) before any permits are approved for this project.

My primary concern is water—both the quantity being withdrawn and the quality that will remain for nearby residents. The scale of this proposed expansion raises serious questions about groundwater sustainability. The amount of water required for a facility of this size has the potential to impact local aquifers, private wells, and long-term water availability in our area. As a nearby resident who relies on groundwater, I am deeply concerned that the current level of environmental review does not fully evaluate these risks.

Equally important are the potential health impacts associated with this project. I am the parent of a medically complex adult child with special needs. Recent lab work has shown elevated levels of pesticides in his system. This makes environmental exposures a critical and personal concern for our family. Any increase in contaminants—whether through manure application, runoff, groundwater movement, or air emissions—could further compromise his already fragile health.

Given the scale of this operation, the volume of manure to be generated and applied to surrounding land, and the uncertainty around cumulative impacts, I do not believe that an Environmental Assessment Worksheet provides sufficient analysis.

A full EIS is necessary to:

Thoroughly evaluate groundwater withdrawal impacts on local wells and aquifers

Assess the risk of contamination from manure, nutrients, and associated chemicals

Examine cumulative environmental and health impacts over time

Consider the vulnerability of sensitive populations, including children and individuals with pre-existing health conditions.

This decision will have long-term consequences for our community's health, water resources, and quality of life. As someone directly affected and responsible for protecting a medically vulnerable child, I urge the MPCA to take a precautionary approach and require a full Environmental Impact Statement.

Thank you for your time and consideration.

Sincerely,

Sam Deseth

Ashley Nietfeld **Letter 729**

Allowing this expansion is immoral. They are damaging the dairy industry everyday. There is already too much milk on the market and they just keep growing and for what? They don't care for the livestock they're all just managers with who knows what agenda. Nothing positive comes from them continuously expanding. Rumor has it that instead of paying investors they just keep growing, like a giant ponzi scheme. Allowing them to continue is unreasonable.

Cheryl Rempel **Letter 730**

At the very least, I am in favor of requiring an EIS for this project before any further decisions are made on allowing the expansion. I lived in Stevens County for 30 years. It's unfortunate that Riverview does not have the integrity to support in depth studies of the impacts of increasing their already massive operations. I would hope that the company leaders would model caring for their neighbors, smaller dairy operations and the environment. They apparently don't rate those concerns higher than making more money.

Nick Elms **Letter 731**

Multiple EIS's should be done for a proposed dairy of this magnatude! This dairy may likely have generational impacts to the local environment and watershead and needs to be thoroughly reviewed!

Sue Kulberg **Letter 732**

I am a resident of and farm land owner in Stevens County. I care about our environment for us and future residents of generations to come.

An EIS definitely needs to be done on this proposed project. Why wouldn't one be done on a project of this size? Why wouldn't Riverview welcome that?

I am concerned that this project could affect ground water supply for others much like happened in Arizona with this same company. There Riverview dug wells as deep as needed while others not associated with them often could not afford to when their wells went dry. It isn't obvious to me `that Riverview cared about surrounding residents lack of water caused by their business in Arizona. Let's not have that happen here.

A full environmental review of the proposed facility should be done to protect resources and help Riverview be good stewards of those resources.

Louise Malecha **Letter 733**

My name is Louise Malecha. I am a lifelong dairy farmer from rural Minnesota, a co-founder of a multi-generational dairy enterprise, and now a founder of a family-based food business rooted in agriculture.

Having spent decades in production agriculture, I understand firsthand the level of responsibility, planning, and stewardship required to operate a dairy of this scale. Modern dairy farms today are highly regulated, technologically advanced, and deeply committed to caring for their animals, protecting natural resources, and contributing positively to their communities.

Operations like West River Dairy represent more than agriculture—they represent opportunity. They bring jobs, support local businesses, strengthen rural communities, and help sustain the agricultural economy that so many families depend on.

In my experience, successful dairies are built on strong values: stewardship of the land, responsible nutrient management, animal care, and a long-term commitment to doing things right. Producers at this level understand that their livelihood depends on maintaining the trust of the community and protecting the resources they've been entrusted with.

I strongly support this project and believe it reflects the kind of thoughtful agricultural growth that can benefit both the local community and the broader region. It is important that we continue to support responsible farmers who are working to feed families while caring for the land for future generations.

Thank you for the opportunity to provide input.

Sincerely,

Louise Malecha

C Ewalt **Letter 734**

We don't support this. It is not reasonable to expect the environment can survive the mass of this assault.

Adam Yucuis **Letter 735**

I'm of the opinion that Riverview must be required to undergo a full Environmental Impact Statement for their proposed West River Dairy Expansion. That potential number of cows all located in one concentrated area would produce a very large amount of manure and would require vast amounts of water, posing a large risk to the local groundwater resources. We need to know of the potential environmental impacts of the proposed expansion before it can move forward.

Robert Lee **Letter 736**

I work with a Riverview dairy, I sell the silage and purchase manure from them. They are a good neighbor and have had a positive impact on my farming operation. Having diverse end users for our crop is important for stability of the corn market. I am in favor of the expansion.

Shane Frahm, AgCountry Farm Credit Services **Letter 737**

ATTN: Charles Peterson

AgCountry Farm Credit Services is a cooperative lender that finances agricultural operations of all sizes across Minnesota. Our lending portfolio reflects the full diversity of the state's agricultural economy. We actively support growth in Minnesota's agricultural sector. A thriving animal agriculture industry is a cornerstone of strong rural economies - sustaining jobs, supporting local businesses, and driving demand for crops grown by producers across the region.

The proposed Riverview expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects big and small are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

Sincerely,

Shane D. Frahm

Executive Vice President

Corey Poepping, Tri County Insulation, Concrete Lifting & Painting **Letter 738**

ATTN: Charles Peterson

My name is Corey Poepping and I am the owner ofTri County Insulation, Concrete Lifting & Painting, a business serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

Sincerely,

Corey Poepping

Owner/President

Patricia Rhoades **Letter 739**

Please require a full environmental impact statement on the proposed expansion of West River Dairy. Riverview Dairy is already the largest factory farm in the state with a history of manure spills. This expansion would generate significant greenhouse gas emissions and the manure runoff would lead to increased nitrates and phosphorus. The state needs to consider the impact on our waterways and on human health.

Dick Metzger **Letter 740**

To Whom It May Concern:

Riverview is a good, reliable, and valuable neighbor. For 23 years, my family and I have been living one mile west of the original Riverview Dairy site. There have been no issues or annoyances in 23 years. I have no concerns that they will continue to be a responsible neighbor. If I didn't look out my windows I wouldn't even know they exist. Riverview has been, and I'm very confident that they will be, a responsible and good neighbor in the future.

In addition, I live 125 feet off the Pomme de Terre River and approximately one mile downstream from the original site and if anyone has a reason to be nervous, it is myself and my family. We have no reservations about this dairy expanding either, if that would be the case in the future.

Is life perfect? No. Does change happen? Yes. Can accidents happen? Yes. And if anything would happen at this site or any other site for that matter, Riverview would do everything in their power to make the situation right. I have complete confidence in their ethics and their practices.

I am an enthusiastic and informed dairy supporter. I grew up on a dairy farm in NW Iowa and I am a 1984 graduate of South Dakota State University's dairy manufacturing program, which is the science and processing of milk and dairy products. We need the stability that Riverview provides to the dairy industry as a whole.

Riverview is not driving small dairy farmers out of business. Small dairy farmers are retiring and there are very few if no successors that are willing to step into this most grueling, labor-intensive, and very time-intensive operation. This is not an 8-5 job. It is 24/7, 365 days a year with little to no vacation time because cows don't stop giving milk on weekends and holidays. This industry is not for the faint of heart, lazy, or people that can't stand up to hard work and taking risks.

In the early to mid-80's I was just entering the dairy industry. In the midwest the milk supply was cyclical, existing dairy plants were older and in need of updating, and California was seen as the only state where the dairy industry was viable and profitable. Over the next several decades, the dairy industry in the Midwest has stabilized and is in a growth mode, thanks in part to companies such as Riverview that have provided a steady supply of milk to dairy plants in the area. This steady milk supply has allowed the dairy industry stability with steady supplies of nature's most nutritious product (milk) that have enhanced the communities where they are located.

As a member of the Morris Area school board from 2008-2018 with four years serving as board president, the Morris area community saw the stabilization of the general population and subsequent growth of the student population. The population in Stevens County in 1990 was 10,621 citizens and by 2010 the population had decreased to 9,726 citizens. From 2010 on, our community has seen a bottoming out of the population, and then has experienced subsequent growth, with the present population being 9,819. I believe this is due in large part, to the investment and growth of companies in our county such as Riverview. People don't just show up in west central Minnesota without available jobs waiting to be filled.

The town of Morris (population of approximately 5,000 citizens) is thriving, rather than dying, like so many detractors would like you to believe. Our downtown has been revitalized. We have a new department store, a new hotel, a new steakhouse, and many thriving businesses and restaurants. Operations people and professionals alike eat, shop, and enjoy our natural resources in Morris.

I find it remarkable, and very exciting to see Riverview playing a key role in providing stability not only to the dairy industry, but to our county and the surrounding area. With this dairy expansion, there would be good paying jobs and satisfying work for the Riverview employees, new tax revenue for the county,

all while knowing they are helping to provide dairy products to not only you and I, but to our fellow citizens.

I want to reiterate my enthusiastic support for this project and thank you for your consideration in this matter. I encourage you to stand behind this project and all the benefits it will bring to our local and surrounding communities.

Sincerely,

Dick Metzger

Lonnie Fosso **Letter 741**

ATTN: Charles Peterson

My name is Lonnie Fosso, and I am a farmer in Manuel Township, Kandiyohi County. I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I recognize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process - one of the most rigorous in the region- and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Lonnie Fosso

Excellent company to work with. Care deeply for anything they are involved in, in my observations Thanks for you consideration.

Judy Lubenow **Letter 742**

I am writing this letter concerning the expansion of Riverview Dairy, which is about 2 ½ miles south of me. I have lived here since 1982.

1. **The odor from manure.**
2. **Dust from the roads both township and county.**
3. **My well water.**
4. **The increase of lines and hook ups along the ditches. (Road)**
5. **The movement of cattle – both cows and calves. In state – out state.**
6. **The effect on the land year after year.**
7. **The effect on surface water. There are lots of lakes, sloughs, creeks and rivers in this area. Also protected areas like wet lands and waterfowl areas. Where does the water (tiled or not) run into?**
8. **Who keeps track of spills, water quality, and so forth. Are they independent of the dairies??**

Judy Lubenow

Joe Neaton, MN National Farmers Board — Letter 743

Governor Tim Walz

LT. Governor Peggy Flanagan

Re: **Request for an Environmental Impact Statement (EIS} for Riverview LLP's Proposed Expansion of West River Dairy, Stevens County**

On behalf of Minnesota National Farmers with our state board voting on this action, I am writing to request that the Minnesota Pollution Control Agency require a full Environmental Impact Statement (EIS} before any permit is approved for the expansion of the Riverview LLP's West River Dairy in Stevens County. The scale of this expansion poses significant environmental, economic, and community risks that cannot be adequately evaluated through a simple Environmental Assessment Worksheet (EAW).

Environmental and Public Health Concerns

- **Groundwater depletion and contamination: Large dairies of this scale require millions of gallons of water annually, placing pressure on aquifers already stressed by agricultural use. Nitrate contamination from manure is a documented risk in regions with similar operations, threatening drinking water safety for rural households and municipal systems.**
- **Surface water pollution: Runoff from manure storage, land application, and feed storage areas increases the risk of phosphorus and nitrogen loading into nearby rivers, streams, and wetlands. This contributes to algal blooms, fish kills, and long-term ecosystem degradation.**
- **Air quality impacts: Emissions of ammonia, hydrogen sulfide, methane, and particulate matter from large dairies can harm respiratory health, reduce quality of life, and contribute to climate change. These impacts are especially concerning for nearby residents, schools, and vulnerable populations.**

Economic and Community Impacts

- **Local infrastructure strain: Heavy truck traffic associated with feed delivery, manure hauling, and milk transport accelerates road deterioration and increases maintenance costs for county and township governments.**

- **Depressed property values: Numerous studies show that proximity to large concentrated animal feeding operations {CAFOs) reduces residential property values due to odor, noise, and perceived health risks.**
- **Harm to independent farmers: Sadly, Minnesota is losing many dairy farms annually due to unreliable and most often below cost of production milk prices. Massive dairy operations like this one affects the market in a way that small and medium sizes family farms are put out of business and off the land. Any new producers will find it hard for a creamery to accept their milk because of the large amount of milk that is produced by these larger dairies. Loss of family farms have a trickle down effect on the local economy which affects Main Street Minnesota.**

Cumulative Impacts and Precedent

Riverview LLP's Dairy is one of the largest milk producers in the country. They own 16 permitted dairy Concentrated Feeding Operations (CAFOs) in Minnesota. The cumulative environmental burden-including groundwater withdrawals, manure spreading, and air emissions-must be evaluated comprehensively. Approving this type of expansion without a full EIS would ignore the broader regional impacts and set a troubling precedent for unchecked growth of industrial-scale livestock operations.

Need for a Full Environmental Impact Statement

Given the scale of the proposed expansion, the potential for significant environmental harm, and the long-term economic consequences for local communities, a full EIS is not only justified but necessary. An EIS would provide:

- A thorough analysis of cumulative impacts
- Transparent evaluation of alternatives
- Opportunities for meaningful public participation
- A science-based foundation for regulatory decision-making

For these reasons, I respectfully urge the MPCA to require a full Environmental Impact Statement before considering any permit approval for Riverview LLP's West River Dairy expansion.

Thank you for your attention to this matter and for your commitment to protecting Minnesota's environment and rural communities. Please feel free to contact me with any questions.

Sincerely,

Joe Neaton

State President

MN National Farmers Board

CC: Commissioner Thom Peterson, Mn Department of Agriculture

Commissioner Katrina Kessler, MN Pollution Control Agency

Dave Rozenboom, First Premier Bank — Letter 744

ATTN: Charles Peterson

My name is Dave Rozenboom, and I am the President of First PREMIER Bank, serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

The agricultural sector is such a key driver in our local rural economies, and we are particularly dependent on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Dave Rozenboom

President

Laurie Golden **Letter 745**

Please complete an Environmental Impact Statement on the proposed Riverview Dairy Expansion. My family lives in an area with 6 Riverview Dairies. Given the high concentration of dairies and heavy daily water use, how will water quality and supply change in 5, 10, or 20 years.

What impact will rivers, streams, aquifers, and wells face?

Land ownership and rental arrangements are becoming more concentrated among a small group of individuals or entities that are associated with the dairies.

How will the roads stand up to the constant heavy traffic of the equipment and trucks used during their harvest of hay ledge and silage? The equipment moves regardless of the weather or road conditions.

I encourage you to protect the future of our land and environment.

The decisions made now will have a profound impact on the quality of life for future generations.

We all need to open our eyes and see what is happening!

If this massive expansion is approved, what is to stop them from expanding every existing dairy?

There are still many unanswered questions about the impact of large dairy farms on communities, such as nearby towns, businesses, schools, churches, cooperatives, and grain elevators.

So, again I ask, please complete an Environmental Impact Statement on the proposed Riverview Dairy Expansion.

Sean Indrelie **Letter 746**

The dairy industry couldn't even survive without generous support from taxpayers, and this is how they repay us? Polluting our air and water? Rural Minnesota smells like feces because of farms like this. Bring back the sea of grass, save the soil and the pollinators. We're headed for global famine by the end of the century if we keep allowing industries like this to trash our only planet.

Sally Carlson-Bancroft **Letter 747**

This is way too big of a livestock operation. Can the company divide it into smaller pieces? Also, it would present unfair competition with traditional family farms. What will become of Princess Kay if all that's left are giant corporations?

Troy Metzger **Letter 748**

After reviewing the comprehensive Environmental Assessment Worksheet for the proposed West River Dairy Expansion, I am writing to support this project and am confident that the EAW document provides a thorough and well-supported analysis of the project's potential impacts. The level of detail already presented demonstrates that key environmental considerations have been carefully evaluated, and the information is more than sufficient to guide responsible permitting decisions. This expansion project represents an important opportunity for economic growth, job creation, and long-term investment in Minnesota and the EAW, and just as important Riverview's past performance and integrity, clearly show that it can move forward responsibly working within this appropriate and well-understood regulatory framework.

Kris Mielnik, Sterling Water Inc. **Letter 749**

ATTN: Charles Peterson

My name is Kris Mielnik, and I am with Sterling Water Inc. in Sauk Centre, Minnesota. Through my work, I collaborate closely with Riverview LLP, providing service and support for their dairy water treatment systems and assisting in maintaining high standards of water quality and efficiency across multiple operations. I am writing to express my support for Riverview’s proposed West River Dairy expansion in Stevens County.

From my direct, hands-on experience, Riverview has consistently demonstrated a high level of professionalism, accountability, and commitment to doing things the right way. Their operations reflect a strong focus on cleanliness, organization, and environmental responsibility. They invest in proper systems, maintenance, and oversight to ensure their facilities operate efficiently and in compliance with regulatory expectations.

Riverview also prioritizes providing a quality environment for their livestock. Their attention to water quality, system performance, and overall facility management contributes to animal health and productivity, which are critical components of responsible agricultural practices. This level of care is not only good for their operation but also supports broader environmental and sustainability goals.

Beyond their operational standards, Riverview is a dependable partner to those of us who work alongside them. They are proactive, responsive, and committed to continuous improvement. This reliability creates confidence for vendors, service providers, and regulators alike, knowing that they take their responsibilities seriously and follow through on their commitments. The proposed expansion represents a positive step for rural Minnesota. It will support local economies through job creation, increased demand for services, and continued investment in agricultural infrastructure. Businesses like

ours depend on stable, well-managed operations like Riverview's to sustain growth and continue serving communities across the region.

Based on my experience working with Riverview, I am confident in their ability to continue operating in a professional, clean, and environmentally responsible manner.

Thank you for your time and consideration. I respectfully encourage the MPCA to support and approve this project.

Sincerely,

Kris Mielnik

Sterling Water Inc.

Andrew Morley, Minnesota Chamber of Commerce **Letter 750**

c/o Charles Peterson

I write today on behalf of the Minnesota Chamber of Commerce (Chamber), a statewide organization representing more than 6,300 businesses and more than 500,000 employees throughout Minnesota. Thank you for completing a draft Environmental Assessment Worksheet (EAW) for the proposed West River Dairy Expansion.

The Minnesota Pollution Control Agency (MPCA) conducted a robust draft EAW that details the project's potential impacts. Evaluating and permitting livestock facilities is not a novel concept for MPCA and other regulatory bodies in Minnesota. The information provided in the draft EAW adequately captures potential impacts to air, water, land, and climate, while detailing the likely required permits.

Minnesota's detailed EAW process is designed to capture all potential impacts of an action. Responsible Government Units such as the MPCA are well equipped and experienced in drafting EAWs with project proposers to ensure Minnesotans understand the project. An Environmental Impact Statement (EIS) is not necessary because the EAW provides the agency with the information it needs for this type of project, per Minn. Rule 4410.4300.

As detailed in the EAW, the proposed West River Dairy Expansion proposes several water retention measures to continue being a leader in sustainability. Building retention basins, reusing an average of 90 million gallons per year of stormwater, and other efforts will help with water use. Further, the expansion must undergo a significant regulatory process for water managed by the Department of Natural Resources.

The dairy sector is an important piece of Minnesota's diverse economy. Expanding the West River Dairy will help Minnesota continue to be a national leader in milk and cheese production and remain as a net exporter of dairy products. The Minnesota Chamber supports the expansion and the benefits it will provide and looks forward to the next step in the process.

Sincerely,

Andrew Morley

Director, Environmental Policy

Minnesota Chamber of Commerce

James Murphy **Letter 751**

To whom it may concern. I am writing to provide some thoughts about Riverview LLP's proposed expansion in Morris of the West River Dairy.

I cannot speak to a lot of what I am reading in the various Minnesota publications' articles about this expansion. That being said, I can speak to my experiences with Riverview LLP.

I have a professional relationship with this company through my position as Executive Director of Traill County EDC. We have had a relationship with Riverview LLP since June of 2024 when they announced the project. Riverview LLP is currently building Herberg Dairy in our community of Hillsboro North Dakota.

At every point in this continuum, I have found the entire Riverview team to be honest, transparent and thorough. All you do is ask and you will get an answer. Part of that information gathering is going to view one of their existing dairies first hand. They are eager to show you how they do business and comply with the standards required. Go and take a tour, you will be glad you did.

From an economic perspective, it's been our community's experience that Riverview LLP is using local vendors, contractors and labor when practicable. That's exactly what I would expect of anyone building in any market. We are looking forward to a long and valuable partnership with Riverview and are excited for the opportunities that lay ahead.

Amanda Mayer **Letter 752**

I'm a concerned citizen of Minnesota that recently learned about the proposed expansion of the dairy farm. I feel the potential impact on our MN natural resources by this private company's expansion of operations is potentially enormous. To me, this very much warrants further exploration and closer examination of the details of this situation. I think a comprehensive environmental review of West River's plans would be extremely appropriate given the magnitude of impact this could have. The scope of this dairy farm expansion is unique. I support getting an Environmental Impact Statement before any permit approval and I hope you do too. Thank you for considering public commentary. We all share this beautiful state together.

Robert Padula **Letter 753**

I strongly support the West River Dairy Expansion near Morris, Minnesota by Riverview Dairy.

Riverview LLC has been an exemplary business and a role model for Agriculture companies. This local Minnesota Agribusiness has been open and honest in promoting their expansion plans to the general public prior to expanding and has gone above and beyond the legal thresholds to ensure compliance with the strict state feedlot rules and environmental requirements. If a proposed site has apprehension by local nearby residents, the company arranges for meetings and site tours of other facilities nearby to assure the local residents how a new site will operate. They have routinely been a good neighbor and work hard to maintain a positive relationships in the local area/community.

Family members of the dairy, farmers who supply feed to the dairy, the on-site workers and others who supply supportive services to Riverview LLC are active members in the community; Positive community relations are part of the business model. The people investing in Riverview are local owners, not "outside investors" - they are citizens that live in the communities where their dairy operations exist. It is not just the dairy owners, but all the supportive service providers that also live in the community. The Lauriston Dairy site is very close to MN highway 40 and is highly visible showing the public how they operate all the facilities. One only needs to drive near their other facilities to see that all of them are

well kept, maintained, neat & tidy demonstrating Riverview's commitment to being good neighbors in the local community.

Dairy farming in the area helps diversify agriculture away from the prevalent "mono-crop" rotation of Corn/Soybeans. This decreases the reliance on agricultural exports and provides a local outlet and value-added benefit to the crops grown locally. Not only will this benefit the farmers in the area, but all the supportive services that rely upon Agriculture and diversification of crops grown in the area will benefit. Diversification of agriculture in the area is also beneficial to wildlife and pollinators.

From the environmental and regulation point of view, feedlots of this size and capacity are heavily regulated and scrutinized to ensure compliance with the strict state regulations for water usage, runoff containment, manure management, dust, odor, pest control and animal health/well-being. This is done well before the first shovel of dirt is moved, prior to construction. The state does not allow a site to begin construction until all the environmental and regulatory permits have been granted. Riverview has always been open and upfront with expansion projects, complying with all the necessary local, state and federal guidelines. They employ staff that are trained and certified to maintain the requirements to ensure compliance. Being a large existing operation, they are constantly under the microscope and subject to outside scrutiny. If there is an area that needs improvement, staff and sites are willing to work with local, state and federal agencies to correct any issues and problems; in fact they seek out ways to be proactive, rather than reactive.

As a livestock farmer and former University of Minnesota Extension Service Livestock Production Systems Agent in West Central Minnesota, I managed a 10 county manure management in West Central Minnesota for 4 years. I know that Riverview has a proven track record of positive compliance and how they have been innovative and proactive in ensuring environmental safety and protection of the environment and local resources. The owners and farmers associated with Riverview also live in the community, and want to ensure that operations are not just "technically legal" but beneficial for the land and everyone who depends on it.

In closing, I fully and whole-heartedly support the expansion of of West River Dairy.

Steven Landwehr **Letter 754**

The Environmental Assessment Worksheet for this project looks very thorough and complete. Riverview has been a great role model in the industry at both designing and operating facilities that meet the strict guidelines that MPCA has laid out, the documents provided in the EAW supports that evidence. Their continued investment in rural Minnesota has helped many communities and farmers remain financial viable for the foreseeable future. These projects bring a valuable nutrient resource to local crop farmers instead of relying solely on commercial fertilizer imported from all over the world. In return these farmers are able to sell their crops locally, this process really reduces the environmental impact related to harvesting crops and getting them to a usable local source. The milk from the project ensures we have high quality food produced and processed locally for all to consume. I am in support of this as this is another project for rural Minnesota that provides new jobs, local economic growth, and an investment that will be there for generations to come that supports many other local residents and industries.

Maureen Mullen **Letter 755**

A dairy farm of this size is not a farm, it's an industrial facility. The water use and the pollution potential is outrageous. The treatment of 18,000 animals in a production facility is inhumane. This is not farming!

We need to support sustainable and healthy agriculture and actual farms, not industrial facilities.

I am concerned both about the potential pollution that this facility could cause to our ground water as well as the precedent. It could set for other facilities in our state. Our ground water is too precious to risk it!

Kara Lundin **Letter 756**

I oppose this expansion because it is an extreme environmental hazard, puts public health at risk, increases the elimination of family farms, and I do not support the poor animal welfare that happens at these large farms. This is not how we should be operating dairy farms. It is inhumane and disgusting. I will not purchase food for my family from dairy industries like this. Our water and our treatment of the life that sustains us should be priority. I strongly oppose the West River Dairy Expansion and would be deeply disappointed if the MPCA provided a permit for this facility.

Debra Ost **Letter 757**

I am strongly opposed to the proposed expansion of the West River Dairy which would create a "farm" totaling 18,855 dairy cows (over 26,000 + AU). I grew up on a small dairy farm in southeastern Ottertail County. Our livestock were treated humanely, the land was stewarded sustainably, profits were fair and competitive, and we were committed to a community that depended upon one another for mutual success. I feel that such a mega-farm, as proposed, is not consistent with the values of average Minnesota farmers, nor of the important agricultural history of our state.

Carrie Redden **Letter 758**

Dear Minnesota Pollution Control Agency,

I am writing to respectfully request that the MPCA require a full Environmental Impact Statement (EIS) for the proposed West River Dairy expansion project. I am a Stevens County livestock farmer, and former dairy farmer, with firsthand experience of the effect that consolidation in the dairy industry has had on limiting access to markets for small and mid-sized dairy farms.

Given the unprecedented scale of this project, a more comprehensive environmental review is both reasonable and necessary. A project of this magnitude carries the potential for significant environmental effects that extend beyond what can be adequately evaluated in an Environmental Assessment Worksheet (EAW).

I am particularly concerned about the projected water use and the cumulative impact on regional aquifers. An EIS would provide a more detailed assessment of these demands and their sustainability over time.

Additionally, the potential impacts on groundwater and surface water quality in the region warrants deeper examination. The proposed manure storage and land application plan raises important questions about nutrient runoff and nitrate contamination. Given the vulnerability of local water resources, including those connected to the Pomme de Terre watershed, these risks deserve a more rigorous and transparent analysis.

Beyond environmental concerns, the size and scope of this project raise broader questions about the long term socioecomonic impact across the state and region. I am passionate about thriving rural communities and feel strongly that we all benefit from more farmers on the land.

In this instance specifically, an EIS feels like commonsense guardrails that serve the greater good. An EIS would ensure that all potential impacts are thoroughly studied, that alternatives are meaningfully

considered, and that the public has a fuller opportunity to engage with the decision-making process. Given the significance of this proposal, anything less would fall short of the level of scrutiny this project deserves.

Thank you for your time and consideration, and for your commitment to protecting Minnesota's natural resources and communities.

Sincerely,

Carrie Redden

Lyn Kerschen **Letter 759**

Concerning the West river Dairy Expansion, an environmental impact study needs to be done. Morris is located along the watershed that channels many streams and lakes into the Pomme de Terre River. Many of these waterways are categorized as impaired by the Minnesota Pollution Control Agency because they failed to meet water quality standards.

Riverview's expansion would more than double its liquid manure storage capacity in Morris, from 102 million gallons to 250 million gallons. This expansion needs further review.

Jane Bartlett **Letter 760**

This is a bad idea all around. The site is in an environmentally sensitive watershed, there aren't people to work in the dairy, and most importantly we don't need it. Please vote "no".

Karen Rom **Letter 761**

Absolutely an EIS for starters; tho I live in Wisconsin now, I am well aware of the huge negative impacts CAFOs have everywhere; there are good reasons for supporting small farms, understanding why we need to limit our appetites for meat and dairy, including running out of water, the spread of disease among animals, the use of antibiotics which will affect human health, and the pollution to air, water, and soil from the enormous amounts of manure, etc. Biohazards need to be considered as well, and the treatment of animals is reprehensible. I don't believe current analysis by West Dairy would meet the standards we perhaps need to raise. Thank you for the EIS! We are trying to get more of them in Wisconsin as well as strong ordinances.

Becca R. **Letter 762**

ATTN: Charles Peterson

My name is Becca and I am writing in support of the proposed West River Dairy expansion in Stevens County.

Through their work in the agricultural sector, they depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Becca

Elias Hultgren **Letter 763**

I am writing today in support of the Riverview application to expand West River Dairy. As a young man trying to get my start in farming in the area shared with Riverview, I have seen first-hand the opportunities working with their dairies brings to our neighborhood.

One of my summer jobs has been running hay merger for our farm and we hire on with them to harvest their forages. I also work in hauling fuel in the silage season. The operations in forage harvesting for Riverview are partnerships between dozens of local farms and the dairy, working together toward a common goal which is quality feed for the cows. Safety is always the most important in all we do, and we work very hard to keep the roads clean and to operate with respect to motorists. We take pride in how good a field looks when we get done harvesting.

My family's farm has worked with Riverview for about 10 years and it has provided a good opportunity to add alfalfa to our crop mix and that strengthens soil quality. We put manure on as many acres as possible as it is very cost-effective compared to commercial fertilizer but also great for the soil.

I think that for my generation to be successful, we need to support progress in our rural areas and partner together to do something bigger than what we could do by ourselves. The West River expansion is a good example of what can be done when local farmers, rural neighbors, and dairy employees can do when they are all working together toward the common goal of safety, utmost care for the animals, and providing an opportunity for young people.

I encourage the MPCA to grant this permit to Riverview.

Sincerely,

Elias Hultgren

Paula Boogaard **Letter 764**

ATTN: Charles Peterson

My name is Paula and I am writing in support of the proposed West River Dairy expansion in Stevens County.

Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Best,

Paula B.

Katherine Myers **Letter 765**

This dairy expansion recently came to my attention, and it's very concerning to me as a citizen of Minnesota. I value our clean water and beautiful land. I fear a massive dairy of this size will only increase water consumption and nitrate levels. These are decisions that can't be reversed and could have lasting environmental effects. I've also been a lifelong supporter of our local co-ops, so I value small family farming and cooperative farming. These corporate dairies are putting local small farms across the state out of business. On top of those considerations, I also have concerns about the animal welfare of a dairy that size. Animals are treated like numbers and dollar signs, which isn't the direction we need to be moving as a community.

Sharon Mansur **Letter 766**

I support the Land Stewardship Project's recommendation that this proposal by Riverview, LLP must be required to undergo a full Environmental Impact Statement (EIS). A facility of this scale located in such a vulnerable area calls for a thorough environmental review, and just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Industrial-Scale Projects Need Industrial-Scale Review! Thank you.

Aubree Derksen **Letter 767**

There needs to be analysis regarding water availability across industries given aquifers stretch across the region, the state and across state lines. Riverview is not happening in a vacuum, it is happening in the context of data centers that are also popping up exponentially wanting to draw from the same water sources as Riverview and use similar and higher amounts of water. We're also facing the same battle with them in trying to have it be required that they also must complete an EIS-not a single one of the now 20 some hyperscale proposals has completed an EIS and 7 are in court. 75% of Minnesotans rely on groundwater for their source of drinking water. The MPCAs own site lists 1800 old, unpermitted, mostly unlined solid waste dump sites that are contaminating our groundwater, with 43 construction and demolition dump sites being monitored only as of 2010 showing arsenic, boron and manganese at levels beyond human and environmental standards and mitigation efforts are not helping. That's only 43 out of 1800 that are even monitored? And the data centers alone could use millions of gallons of water a day each plus chemical contamination from industrial wastewater they claim is nonexistent (Pine Island) and they're not doing an EIS, and now Riverview wants 316 MGY plus contamination from manure. It is absolutely essential that MPCA require an EIS if it stakes any claim at all to caring about protecting clean water.

David Hauge **Letter 768**

Groundwater contamination issues shud b forefront of such expansion. That much manure in one location, creates potential problems overtime. Is a digester plan involved. Maybe the greatest issue will be the affect on smaller dairies. A farm of this magnitude will get all the business breaks smaller dairies will b unable to compete with

Faith Rudnitski **Letter 769**

The concentration of 18,855 dairy cows at one site and storage and spreading of the resulting liquid manure creates a risk of contamination of ground and surface water in the Pomme de Terre rivershed. An expansion of this size should be investigated more fully before a permit to construct and operate a facility with this many animals goes forward.

Tara Nelson **Letter 770**

I'm interested in MN investing in less dairy expansion and more wildlife conservation. There are awesome wildlife areas in Morris MN that I am worried could be impacted long term

Abby Konz **Letter 771**

Concern over one business owning 1/3 of the dairy cows in Minnesota. Also concerns over that much manure in one area as well as the water demand.

Garrett Luthens **Letter 772**

Dear Mr. Peterson,

I am a dairy farmer, and I am writing in support of Riverview LLP's proposed expansion of West River Dairy near Morris, Minnesota. My family owns and operates Skyview Dairy, a second-generation dairy that has been in operation since 1968, when my father started milking seven cows.

I am not writing this letter merely to support one company's project. I am writing because a growing milk supply benefits every dairy farmer in this state, and because Minnesota's environmental regulations are comprehensive, robust, and fully capable of protecting the environment without the need for an Environmental Impact Statement.

The economics of our industry are straightforward: when milk supply grows, processors invest. When processors invest, every dairy farmer — regardless of size — has a stronger, more reliable market for their milk. We are seeing significant growth in dairy processing capacity across the Upper Midwest and throughout the country right now, and a growing milk supply is needed to support those investments. The U.S. dairy industry has a great opportunity in front of it to grow. Minnesota should be leading that opportunity, not creating barriers to it.

I know from personal experience what it means to have a strong dairy industry behind you. When Skyview Dairy wanted to increase the size of our herd in 2008, the dairy community came to our support and spoke on behalf of the industry's positive financial impact on communities and the counties where we operate. A growing milk supply allows us to maintain the economic ecosystem that makes dairy viable for all of us.

Calls for an Environmental Impact Statement: they are not warranted by the facts or by the law. Minnesota already has one of the most robust environmental review and permitting systems for livestock facilities of any state in the country. This project has undergone lengthy and rigorous analysis through the EAW process. And the expansion will operate under an Individual NPDES Feedlot Permit — more stringent and site-specific than the general permits most Minnesota feedlots operate under — requiring zero discharge of pollutants to waters of the state. Coupled with the DNR's protective groundwater permits, the environment will be protected.

Furthermore, the individual permit set to be in place here was developed after a collaborative process with the MPCA to develop enhanced permit requirements. That kind of good-faith engagement with

regulators should be encouraged, not punished by an unnecessary EIS that would only delay a well-reviewed project.

I believe a strong, growing dairy industry is good for every farmer in this state. The West River Dairy expansion supports that. It creates jobs, provides a market for locally grown crops, and supplies locally produced fertilizer (manure) to. I respectfully urge the MPCA to follow the facts and the science. The EAW is thorough and complete. The environmental protections are robust and enforceable. No EIS is needed. Please allow this project to move forward without further delay so that Minnesota's dairy industry can continue to grow — for our communities and for the next generation of farm families.

Thank you for the opportunity to provide this comment.

Garrett Luthens Skyview Dairy

Tony Domnick **Letter 773**

Public Comment – Support for West River Dairy Expansion

My name is Tony Domnick, and I live approximately 3.2 miles from West River Dairy. I have lived here since the dairy was first established, and I am writing in support of the proposed expansion.

As I sat down to write this, I came to the conclusion that this isn't something we need to ruminate on forever. We can't milk these concerns beyond reason. At some point, we need to be honest with ourselves, has Riverview hurt me, or have they helped me? Have they hurt the community, or have they helped it?

Let's separate the cream from the milk, the facts from the fluff.

Businesses that have chosen to work with Riverview have continued to grow and prosper, bringing additional opportunities and jobs into our area. A thriving community leads to stronger local businesses, more opportunities for families, increased school enrollment, and a safe, clean place to live. Even those without direct ties to the dairy still benefit from that growth.

Like any operation, there are occasional growing pains, minor nuisances, frustrations, and differing opinions. No business is perfect. But from what I've seen, Riverview has been willing to address issues and take responsibility when needed.

From a neighbor's perspective, living just over three miles away: our shallow well still provides clear water. Road concerns like mud or dust from truck traffic are addressed quickly. What is a problem one day is typically resolved the next. We've also had the opportunity to sell alfalfa and silage to the dairy and receive manure in return, which has been a significant benefit to our family farm.

Some may ask, "When is enough, enough?" And maybe I'm blinded by my addiction for cheese, but this is the community where Riverview started, and it's clear they are committed to staying here. Expanding in an area where they are already established, among neighbors who are familiar with their operation, seems to bring more benefits than drawbacks. Increased demand for feed and additional acres for manure application both support local farmers and strengthen the agricultural economy.

This expansion represents continued growth and opportunity for our community, and I believe it deserves our support.

Sincerely,

Tony Domnick

Kent Bosch **Letter 774**

I am commenting to support Riverview's expansion project near Morris. We consider ourselves lucky to farm in close proximity to two of Riverview's newer facilities in Chippewa County Minnesota. Our county was void of livestock for the most part before Riverview got involved. They are adding a needed dimension and diversity to our farmland. The liquid dairy manure is great for the soil health and better quality and lower cost than commercial Fertilizer. Putting alfalfa into our sugarbeet and corn rotation adds diversity to our other wise fairly monocrop system. Also, we are adding value to our corn Crop locally rather than shipping it overseas or out of our area on rail. This alone helps with the price by creating a lower basis for all corn producers in western Minnesota. And I can say that Riverview has been a very good environmental steward and super good neighbors while providing good jobs and opportunity for young families wanting to stay involved in farming. Most of the negative comments I see on these dairies has to do with size and scale. My thought on that is that it is better to have this type of animal agriculture than to not have any. That is where we were headed in my neighborhood. I am third generation living and farming where I am and have been around, livestock most all of my life. I know of no other smaller farm that takes better care of their animals and the environment than Riverview does.

Evan Grong, Valley Queen Cheese Factory, Inc. **Letter 775**

c/o Charles Peterson

I am writing on behalf of Valley Queen Cheese Factory, Inc. to formally express our strong support for the Minnesota Pollution Control Agency’s approval of Riverview LLP’s permit application for the proposed expansion of the West River Dairy.

Valley Queen Cheese Factory, Inc. is a South Dakota-based, privately held cheese and dairy ingredients manufacturer headquartered in Milbank, South Dakota, where we have operated since 1929. Today, Valley Queen employs more than 450 people and remains deeply committed to providing long-term economic opportunity for our employees, business partners, and the rural communities in which we operate. Valley Queen has grown in step with the dairy industry. Most recently, we completed a significant expansion project in 2025 representing an investment of more than $200 million, which increased our milk processing capacity by over three million pounds per day. Looking forward, Valley Queen intends to continue growing to meet increasing customer demand for dairy products. That growth relies on a stable supply of high-quality milk from progressive, well-managed dairy farms.

Riverview LLP has been a trusted and valued dairy producer partner of Valley Queen for more than two decades. Throughout this relationship, Riverview has demonstrated exceptional standards in milk quality, animal care, operational management, and environmental responsibility. Based on our longstanding experience working with Riverview, we are confident in their ability to responsibly execute the proposed expansion at the West River Dairy in full compliance with applicable environmental regulations and MPCA permit requirements.

Continued, well-regulated growth within the regional dairy industry provides meaningful benefits to local and state economies while maintaining strong environmental oversight. Dairy operations generate significant economic activity across rural communities, supporting employment, local businesses, and agricultural stability throughout the region. Responsible expansion projects such as this one help ensure

that dairy production growth occurs within a regulated framework that protects natural resources while sustaining economic vitality.

For these reasons, Valley Queen Cheese Factory, Inc. respectfully encourages the Minnesota Pollution Control Agency to approve Riverview LLP's permit application for the West River Dairy expansion. We appreciate the Agency's careful review and its role in ensuring environmentally responsible development across Minnesota.

Sincerely,

Evan Grong

Dairy Ingredient Sales Manager

Nathan DeLeeuw, Dooley's Natural Gas **Letter 776**

To whom it may concern,

I am writing on behalf of Dooley's Natural Gas in support of the proposed 11,000 cow dairy in Section 1 of Synnes Township in Stevens County. As an organization who works closely with agricultural producers and rural businesses, we believe it is important to recognize projects that strengthen our local economy while demonstrating responsible planning and long-term commitment to the communities they serve. Thoughtful agricultural development is essential to preserving rural vitality, and this proposal represents an opportunity to do exactly that.

One of the most meaningful contributors to that economy in Stevens County is Riverview Dairy. Riverview Dairy has made significant and lasting contributions to the local economy through job creation, capital investment, and ongoing support of local businesses. Beyond their economic impact, they have consistently demonstrated commitment to the communities in which they operate and have proven to be responsible stewards of the land and natural resources.

Dooley's has been a fuel and propane provider to Riverview Dairy for several years. Through this business relationship, our company and employees have directly benefited from Riverview Dairy's growth and continued investment in the region. Their success supports not only agricultural operations but also local service providers, suppliers, and workers throughout the rural economy.

In closing, we believe Riverview Dairy's proposed expansion reflects the type of responsible agricultural growth that benefits Stevens County both now and into the future. Their track record of economic contribution, environmental stewardship, and community involvement demonstrates that they are a trusted partner in rural development. For these reasons, we respectfully express our support for this project and encourage decision-makers to recognize the positive impact it will have on our local economy, workforce, and agricultural sustainability.

Sincerely,

Nate DeLeeuw

General Manager

Dooley's Natural Gas

Kathy Arthun **Letter 777**

Dear MPCA Officials,

I am writing as a concerned resident to strongly urge the Minnesota Pollution Control Agency (MPCA) to require a full Environmental Impact Statement (EIS) for the proposed expansion of Riverview, LLP's dairy concentrated animal feeding operation (CAFO) in Stevens County.

Due to the unprecedented magnitude of this proposal, Minnesotans deserve the highest level of environmental review available. This would be the largest livestock operation in state history, and a project of this scale warrants far greater scrutiny than a standard review process provides.

I have been a volunteer lake and stream monitor for the MPCA since 2019. I monitor Barrett Lake, which is part of the Pomme de Terre watershed downstream of the proposed site, and I have also monitored the Pomme de Terre River where it enters Barrett Lake. Over that time, I have observed a decline in water quality. Even without a facility of this size upstream, there are already many weeks each year when Barrett Lake is not suitable for recreation. The addition of a 26,000+ animal operation raises serious concerns about further degradation.

This proposal presents several significant risks:

Water Use and Water Quality

A facility of this size would require substantial water use and generate an enormous volume of manure. Given the location within the Pomme de Terre River watershed, near already impaired waters, the risks of nutrient runoff, groundwater contamination, and accidental spills must be thoroughly evaluated.

Proximity to Sensitive Areas

The site is within five miles of multiple protected waterfowl and wildlife production areas. These are sensitive ecosystems that could be significantly impacted by contamination or runoff.

History of Environmental Incidents

Riverview has experienced manure management issues in the past, including a 2025 leak at its Meadow Star Dairy facility in Kandiyohi County. This history underscores the need for careful, comprehensive review.

Impacts on Rural Communities

An operation more than 60 times larger than the average Minnesota dairy farm could accelerate consolidation, harm small and mid-sized farms and alter the character of rural communities. Residents may also experience increased traffic, odor, and air quality concerns, along with potential declines in property values.

I value living in this area and the natural resources it offers. However, a project of this scale raises serious concerns about long-term environmental quality and community sustainability.

For all of these reasons, I respectfully request that the MPCA require a full Environmental Impact Statement before proceeding with any approvals for this project.

Sincerely,

Kathy Arthun

Steve Veverka **Letter 778**

I am writing this communication to express my full support for the expansion of the Riverview West River dairy expansion. Modern agriculture is complicated. No ag business in Minnesota navigates that complicated system better than Riverview . The fact that they incorporate a diverse, highly paid work

force and are excellent stewards of the environments is really one of the great agricultural success stories in Minnesota . The current review process is completely adequate and an EIS is not necessary.

Margie Diggins **Letter 779**

I'm against forcing animals into these crowded, non pastured, conditions for the sake of more efficient milk production. Cows should be out in green pastures under sunshine & called in twice a day to be milked, like I was raised on our small hobby farm. I no longer support dairy from these big industrialized facilities. Grass fed naturally is where food production is going...catch a clue... It's much healthier for us & our children & the animals. Thank you for listening.

William Henke **Letter 780**

Hello and thank you for allowing the public to comment on this project. In my opinion this project should not be allowed to proceed. I believe that this project is environmentally dangerous in terms of the mammoth amount of manure that it will distribute and the quantity of water needed to support it. An EIS should absolutely be required before any further steps are taken. In addition, I believe that CAFO's are inhumane, a severe risk for zoonotic infections and a public health risk in terms of increasing antibiotic resistance. Lastly, these huge confinement operations have been the death knell to the small dairyman (woman) and the small rural communities that support them. We can do so much better! William Henke

Cody Harford **Letter 781**

I am commenting to express concern about the proposed Riverview West River dairy. This 18,500-cow facility would add to Riverview's already extensive operations in Minnesota, where the company houses more than 133,000 cows—about one-third of the state's dairy herd. Continued consolidation on this scale has contributed to the steep decline of family dairies, which are essential to the economic and social health of rural communities.

A single facility of this size also carries significant environmental risks, including manure management, water use, and air quality impacts. These cumulative effects should be carefully evaluated.

I urge the MPCA to fully consider both the environmental and community consequences before approving a project of this magnitude.

Kathleen Von Rueden **Letter 782**

These large livestock produce huge pollution to ground water risk, manure spill risk and crowded living conditions for livestock.

Scott Savage, E. A. Bonelli + Associates, Inc. **Letter 783**

ATTN: Charles Peterson

My name is Scott Savage, President of E.A. Bonelli + Associates, an architectural and engineering consulting firm that serves the dairy industry and supports operations in Minnesota like Riverview. I strongly support their proposed West River Dairy expansion in Stevens county.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

Our firm has been working closely with Riverview for over five years and, in that time, we have known Riverview to be a professional and reliable partner that contributes positively to the communities where they operate. We believe in Riverview's mission to strengthen the industry and address critical gaps. Riverview has a genuine commitment to their employees, the local communities in which they operate, and their agricultural partners. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project

Sincerely,

Scott Savage

President

E. A. Bonelli + Associates, Inc.

Cody Suter **Letter 784**

Cody Suter

To Whom this may Concern. I live 1.5 miles from a Riverview Dairy. They run a top tier operation, clean facilities, care for the land, do what is right for the local communities, and give great care to the livestock in their operations. These Dairy's I believe help the local Ag community in a number of different ways such as 1. providing manure for fertilizer so we do not need to rely on foreign Fertilizers that are controlled by a few major producers around the world 2. Giving local farmers another place and market to sell their crops they produce, this helps create demand and increases local basis markets that adds value to every producer in the area no matter if you are in favor of this project or against. From the outside looking in I know they follow a long list of rules and regulations; they are doing things correctly. This project and other projects like this add value to rural America. I support their expansion project in Stevens County

Michelle Peterson **Letter 785**

I want to continue living in a state with higher standards than other states. I want to be proud of the environmental firsts Minnesota can show in this Era of backsliding.

Audrey Kruger **Letter 786**

I vehemently oppose this expansion. Small, regenerative farms are the only future I want to see in farming.

Amie Tatosian **Letter 787**

We should be supporting small, local farmers, not promoting and allowing for massive operations like this one. This is beyond the environmental impact of having so many animals in a small area, it is also about caring about our local farm families that have been around for generations. Mass production is not the answer.

Sean Gallant, Industrial Environmental Concepts **Letter 788**

ATTN: Charles Peterson

My name is Sean Gallant, and I am one of the owners of Industrial Environmental Concepts, a Geomembrane Cover/Liner Business serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Sincerely,

M. Sean Gallant

Director of Operations

Lori Peterson **Letter 789**

Do not allow this monstrosity to expand!!! Horrific for animals and the environment

Cassie Dudley **Letter 790**

I am writing in earnest opposition of this expansion and in favor of an obligatory EIS. Progress can no longer equal capital growth and expansion if we are to continue to inhabit this planet. Shortsighted economics are causing incredible suffering to numerous species whose sentience should not be ignored. Agricultural workers in feedlots incredible health risks. West River Dairy and CAFOs in general need to be phased out, not expanded! They displace small scale MN family farms, reduce rural property values, impose numerous environmental impacts including water and air quality degradation, and inflict public health concerns such as respiratory illnesses and disease transmission. The long-term pollution impacts cannot be overlooked while regulations aimed at tracking manure application face backlash. As is obvious in the letters of support, the only people in favor of this expansion are those who will fatten their wallets out of the deal. MPCA must enforce policy that protects our planet and people. "Only when the last tree has been cut down, the last fish caught, and the last stream poisoned, will you realize you cannot eat money."

Shane Wiercinski, Complete Filtration Resources, Inc. **Letter 791**

Dear Mr. Peterson,

My name is Shane Wiercinski, and I am the Director of Business Development for Complete Filtration Resources, Inc. (Complete Filtration), a filtration and wastewater treatment solutions provider serving dairy operations across the country, including Riverview, a valued partner and customer. I am writing in strong support of Riverview's proposed West River Dairy expansion in Stevens County.

At Complete Filtration, our work is deeply tied to the health and growth of the agricultural and dairy industries. Projects like the West River Dairy are exactly the type of responsible, well-managed operations that anchor rural communities and create lasting economic opportunity.

This proposed 11,000-cow expansion is a significant investment in Minnesota agriculture and in the communities that depend on it. Projects of this scale generate substantial demand for vendors, suppliers, and service providers, including companies like Complete Filtration, and support both direct and indirect employment throughout the region. They also reinforce the infrastructure needed to sustain a competitive dairy industry in the Upper Midwest for years to come.

From our direct working experience, Riverview is a professional, forward-thinking operation that takes its responsibilities seriously. They invest in the right equipment, maintain their systems to a high standard, and engage meaningfully with the vendors and partners who support them. We have every confidence that they approach environmental stewardship with the same level of commitment.

We understand that Minnesota's environmental review process is thorough and rigorous, and we trust that Riverview has engaged fully with that process. An Environmental Impact Statement does not appear necessary given the existing review framework and the demonstrated track record of operations like this one. We respectfully urge the Minnesota Pollution Control Agency to support approval of this important project.

Continued investment in production agriculture is essential to keeping rural Minnesota vibrant. Thank you for the opportunity to comment, and for your consideration of the voices of the businesses that depend on and contribute to this industry.

Sincerely,

Shane Wiercinski

Director of Business Development

Complete Filtration Resources, Inc.

Paul Burck **Letter 792**

The proposed Riverview Dairy expansion is so huge that it should be required to complete an Environmental Impact Statement before a permit is granted by the MPCA.

Jeff Steiner **Letter 793**

To Whom It May Concern,

I am a longtime resident of the Morris area with a degree in Agronomy, and I worked for many years as a Certified Crop Advisor in Stevens County, including working directly with Riverview Dairy in 1995 when the very first dairy was built. In addition, I have had the opportunity to tour Riverview's facilities on multiple occasions over the years. I am also personally acquainted with many Riverview employees and managers. Based on these firsthand experiences, I fully support the proposed project and believe the

Environmental Assessment Worksheet (EAW) provides an adequate level of review; I do not see the need for a full Environmental Impact Statement (EIS).

Some of the concerns expressed about manure management seem to overlook the existing regulatory framework. Facilities of this type are already subject to strict oversight through MPCA feedlot permits and detailed manure management plans. This proposal includes more than a full year of manure storage capacity and access to significantly more land for application than is required by regulation. These requirements are specifically designed to protect water quality and ensure responsible nutrient use. As an agronomist, I can attest to the superior value and desirability of using manure as a fertilizer and nutrient source for crops, both for crop productivity and for enhanced biome management and excellent soil health.

I would also urge reviewers to consider the actual long-term water monitoring data for the Pomme de Terre River watershed. Information collected over the past decade shows that water quality and biological health in the watershed has remained stable, despite agriculture being a dominant land use in the region for many years. Any concerns regarding potential impacts to the Pomme de Terre River, Drywood Creek, or Muddy Creek should be weighed against this historical data.

Furthermore, with regard to water use, it is important to note that groundwater withdrawals for projects like this are carefully reviewed and permitted by the Minnesota Department of Natural Resources. This permitting process is intended to ensure sustainable use of aquifers, and it applies equally to agricultural operations, other industries, and communities.

It is disappointing to read comments from individuals who appear to have limited familiarity with the local area and the way in which Riverview operates. The company has earned a strong reputation in our community for running well-managed facilities. Whenever I have visited, the sites have consistently been clean, orderly, and clearly operated with a high degree of professionalism and care. In contrast, many of the small dairies I see in the area often have significant manure run-o concerns and excessively untidy facilities. The pollution potential from the 220 “small” dairies, each with 50 cows, needed to supply equivalent milk for our needs would have significantly more impact on our environment than what I have seen from the highly skilled operators at Riverview Dairy.

In addition to the environmental considerations, Riverview has been a strong partner for the young people in our communities, promoting modern, science-based farming practices, hosting student tours that provide meaningful learning opportunities about animal care, technology, and sustainable food production, and encouraging pursuit of higher education through scholarships, internships, and on-the-job training, and generally providing experiences that benefit countless young people exploring careers in agriculture and environmental fields.

Riverview plays a vital role in supporting the local economy. As a resident of our small community and the surrounding county, I have observed how major employers like Riverview help provide stability for rural communities by supporting local suppliers, contractors, and other businesses across the region. Many of the employees’ children attend our small independent Hancock School District and have helped sustain and grow a school that had 225 students in 2011 and now has more than 450 students!

In summary, I encourage the reviewing agencies to base their decision on the available data and the established regulatory processes. The EAW appears to offer a thorough evaluation of potential environmental impacts. For these reasons, I believe the EAW is sufficient and that a full Environmental Impact Statement is not required.

Thank you for your attention to this matter.

Sincerely,

Jeff Steiner, BS Agronomy, University of Illinois ‘90

Patricia Cole **Letter 794**

To Whom it May Concern,

I am writing to formally express my strong opposition to the proposed expansion of the Riverview dairy operation in Morris, Minnesota. As a concerned citizen who worked for over 40 years as a Registered Professional Engineer, I believe this project—which would become the largest livestock farm in state history—poses unacceptable risks to our local environment, our groundwater and the health of our community.

My primary concerns include:

Water Depletion: The facility is permitted to pump up to 226 million gallons of water per year. This massive appropriation rivals the consumption of the entire City of Morris (permitted for 300 million gallons) and threatens to deplete local groundwater and impact the Pomme de Terre River.

Nitrate Pollution: The collection and application of manure from such a massive number of animals significantly increases the risk of nitrates leaking into groundwater. Given Riverview's history of manure spills in western Minnesota, I am deeply concerned about the long-term safety of our drinking water, and the impact that will have on the cancer rates of those living in the area.

Inadequate Environmental Review: I join organizations like the Land Stewardship Project in calling for a full Environmental Impact Statement (EIS). The current Environmental Assessment Worksheet (EAW) is insufficient to address the unprecedented scale of this facility and its cumulative impacts on the region's land and water.

I urge the MPCA to deny the current permit and require a more rigorous environmental review to protect the health and resources of Stevens County residents. The impact of these large scale corporate farms and livestock enclosures on the health of our groundwater aquifers needs to be of concern to ALL Minnesotans!

Sincerely,

Patricia Cole

Kay Fuller **Letter 795**

I have switched from regular ultra pasteurized milk to low temp pasteurized milk from small farms. I am opposed to larger and larger dairy farms. It seems like smaller dairy farms could employ as many people and it would be boom to small business. It also seems that raw and low temp pasteurized milk are coming back into favor. Please don't let this large dairy take over more small dairy farms!

Jackie Colesworthy **Letter 796**

I am opposed to this operation for several reasons. Having this many animals on a feedlot is inhumane treatment. The waste from them would be damaging to the environment, and I would never drink an ounce of milk from such an operation. Restorative, regenerative farming is the best way to treat animals and the soil they live on. Please turn this proposal down.

Jennifer Zeltwanger **Letter 797**

Subject: Support for West River Dairy Expansion

My name is Jennifer Zeltwanger and I've lived in Darnen Township, Stevens County for 17 years about two miles from Riverview Dairy. Our home is about eight miles from West River Dairy.

Based on our experience as neighbors, I support the West River Dairy expansion. No EIS is needed as the state environmental review process is rigorous and very sufficient. I reviewed the over 600 pages of documents in the EAW with input from numerous industry professionals and am impressed with the amount of time, effort, energy, and cost that has already gone into the permitting process to get to this point. As a fellow cattle producer, I fear the precedent that could be set by requiring a farm that has clearly already met all the requirements set out by the MPCA to obtain their permit to move into a new level of regulation. I respectfully encourage your support and approval of this important project and believe the expansion will continue to reflect the same level of care and professionalism Riverview has demonstrated time and again.

As very close neighbors to Riverview Dairy, we've been able to see how the dairy is managed and maintained in a clean, professional manner. Our house is across the road from a field farmed by Riverview for cattle feed and is on the harvest truck routes. Truck traffic has been handled responsibly, and local roads are kept in good condition through pre-season application of chloride for dust control and box scraping to remove mud or repairing as needed. This happens around all the sites in our county, including at West River Dairy.

Having the three local Riverview dairies has provided stable employment opportunities in our community for service providers, construction companies and other local businesses. Expansion at West River Dairy builds on this by bringing in additional jobs, families, and opportunities. Small towns like ours need growth to support our schools, businesses, and civic leadership needs so a quality business like Riverview adding additional passionate staff members who participate in the community is a boon for Stevens County.

After living near another of Riverview's dairies in Stevens County for nearly two decades, we have had no negative impacts on our lives (not on our well, our land value, our family, our community). In fact, I would say the opposite is true. Having Riverview's dairies in our area has brought more opportunity and diversity to our community and enriched our experiences living in the Morris area. I urge your support of the approval of the West River Dairy Expansion in Stevens County.

Sincerely,

Jennifer Zeltwanger

Crystal Prom **Letter 798**

To whom it may concern,

I am writing to dissuade the use of an EIS with regards to the expansion of Riverview in Stevens County. I, as an experienced dairy consultant in the Upper Midwest, have visited several Riverview sites and found them to be clean, professional, and committed to producing nutritious milk products while also being good stewards of the land. Going through the EIS process will be an expensive and time-consuming waste of resources and only stand to harm dairy product consumers. From my observations, Riverview is an excellent boon to the rural communities of Minnesota and beyond.

I am asking that you do not proceed down the EIS pathway and instead follow normal environmental assessment processes with regards to dairies.

Sincerely,

Crystal Prom, PhD

Dairy Focus Consultant

Thomas Obar **Letter 799**

I am in favor of the expansion of the dairy.

Ethan Hoffman **Letter 800**

I am in favor of the expansion.

Nick Meierhofer **Letter 801**

I am in favor of this expansion. Great company.

Corey Roberts **Letter 802**

For what reason does Riverview need to keep expanding their dairies? They are already running small farmers out of business. The same small dairies that built communities. The same communities that are becoming ghost towns because places like riverview dairies don't support local infrastructure. Veterinary, construction, etc., are done in house and don't support members of local community. They say they create jobs but bring in more illegal immigrants for cheap labor. They use their size and scale to push others around. Basically taking over AMPI (Associated Milk Producers Inc.) and claiming a $2cwt premium over other producers for a "volume discount". With milk prices already where they are, how can other dairy producers compete? With dairies of such scale comes greater risk of pollution as well. Look at the what has already happened when an upright manure silo exploded at the Meadowstar location in Pennock, Mn. Shrapnel of the silo and hundreds of thousands of gallons of liquid manure littered the ground. Not to mention that anybody nearby when that happened would have been killed. Loss of nitrates from such manure spills end up in our water. This affects wildlife and have the potential to lead to cancerous cases, diminishing the quality of life. How can we let systems like this continue to go into place? Riverview does not support local community infrastructure nor are they good for environment.

Sandra O'Brien **Letter 803**

I am very concerned about the negative impact on the environment if West River Dairy is allowed to expand as requested. It goes against everything I have learned about Minnesota farms working towards sustainability. The extra manure and methane would contribute to climate change, water pollution and air pollution. Can the neighbors enjoy breathing in fresh country air near the dairy as it is now? And the humane treatment of cows would be a great challenge with so many extra livestock. Expansion also jeopardizes the livelihood of smaller dairy farms. There are so many reasons against it. Please do not approve.

Kyle Staebler **Letter 804**

ATTN: Charles Peterson

My name is Kyle Staebler. I am a resident of Swift County, and I farm in Stevens County. I am writing in support of the proposed West River Dairy Expansion.

I grew up on a small neighboring, family dairy farm in Stevens County about four miles from Riverview Dairy. My grandfather milked for forty years and later chose to transition to grain farming. I have seen Riverview's commitment to being a good neighbor to my family, other local farmers, and businesses.

I have worked with Riverview on many occasions at their facilities. Their operations are well kept, organized, and clean; staff consistently conduct themselves with professionalism and an emphasis on safety.

Manure management and water use are highly regulated in Minnesota, and Riverview has demonstrated attentiveness to those regulations and to nutrient management. There are clear benefits to the responsible use of manure on farmland to improve the soil health, organic matter, and reduce erosion to support long-term agricultural sustainability.

Riverview is diligent with soil testing and manure application, ensuring they meet or exceed required standards.

Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens, including an EIS, are unnecessary.

I respectfully encourage the appropriate agencies to approve the West River Dairy

Expansion.

Respectfully,

Kyle Staebler

Kelsey VanOverbeke **Letter 805**

My name is Kelsey VanOverbeke and I would like to not only express my support for the expansion project at West River Dairy, but also give my personal & professional experiences interacting with Riverview directly & indirectly. I grew up on a farm near Campbell, MN which some of our family land is near the Campbell Dairy location. I have worked in the local agriculture industry in MN, ND & SD mainly within the counties of Wilkin, Traverse, Grant, Ottertail, Big Stone & Stevens in MN; Richland, Sargeant, Barnes in ND & Roberts in SD for 20 years as a professional agronomist with a B.S. degree in Agriculture Economics & also Crop & Weed Science from NDSU, Certified Crop Advisor including credential of certification to work with large dairy operations, Technical Service Provider for the NRCS including 590 & 595 mainly for Nutrient Mgt & IPM. I work with 32 farms that account for about 285,000 acres of farmland mainly in an 80 m radius of Fairmount, ND.

My first experience with Riverview was when the Campbell Dairy was proposed. From a farm girl perspective of it being my hometown, you always wonder who is this "new business" that is moving in and change is hard for anyone to accept. However, the way Riverview was honest & transparent with their intentions as well as the legal steps they had to take to even have the project considered, let alone a permit approved, exceeded the expectations of myself and so many others that I heard from in the community and through the daily conversations of my job. As they always say, "Good intentions are overrated. Good actions is where the proof of character exists." Riverview showed our community of Campbell MN the proof of their character as a business and as people; not just in the business interactions but also their support for the community and working with neighbors both farmer neighbors and non.

Fast forward to current interactions with Riverview management, local dairy location management and staff in the Red River locations & Stevens locations, farm operations management and staff as well as

their agronomists, contracted operators, etc; my impression of Riverview as a dairy operation, farm operation & the people in general keeps exceeding my expectations with every interaction I have with them. Again, as an agronomist I interact with many farm managers, operators, staff, etc on a daily basis & what I can confidently say about Riverview Personnel is that they carry themselves in a professional, ethical manner in which they always are more than happy to hear any questions, concerns, recommendations, etc anyone has to offer. They follow their legal & moral duties without wavering. I cannot say that about too many businesses otherwise that go to the extent that they do. They have a large business to run, but unlike most people I see with that much responsibility, they always seem to make time to spend time in their community, with local growers & neighbors, youth, etc whether it be in a community parade event to show support or a winter meeting providing an educational presentation and open discussion with their very knowledgeable Master Agronomist whom I have a great deal of respect for.

Knowing the massive amount of agronomic benefits having manure in your crop rotation can provide in various ways as well as the diversity of the alfalfa in crop rotations and silage as an option as well; the Riverview Dairy locations in our Red River Valley area have provided intangible benefits & measurable returns to the local farmers who participate in a relationship with Riverview. I know through direct conversations with growers in that area that tell me if Riverview had not been approved to set up their dairy location in our local home area of Campbell & Nashua (Campbell Dairy & North Ottawa Dairy); there would have been some tough decisions to make on some farms to either rent out or sell in some cases. However, because Riverview set up a dairy and offered silage & haylage acres including the option of manure, those farms are still in operation today and thankful the opportunity was there for them to diversify their operations and their source of nutrients to help with the biology of their soil as well as the organic matter & water holding capacity that had been struggling in recent years. I have seen this first hand in fields I work with directly that there are many agronomic advantages to the soil health & biology mainly through carbon sequestration that the alfalfa provides, improvements in Organic Matter & C:N balance in creating a balanced soil biology for microbes to excel in creating better soil health and mineralization, etc. I walk alfalfa fields weekly and am so thankful that we are able to grow it in the Valley where it typically would not have any reason to be grown otherwise. Many alfalfa crops that come out of rotation also allow for us to not have to apply as much nitrogen for a crop year or two as the residual N is consistently sufficient as a large percentage of the next year's corn crop needs.

This is extremely important in times like we are in now with extremely high fertilizer prices to be able to have growers access alfalfa acres and manure. The growers that I work with that have the least cost of production per bu produced are ¾ of the time a grower that works with one of the Riverview Dairy locations to grow silage, haylage and access manure. This is the kind of options we need in agriculture for these local farms to survive and leave their legacy for the next generation.

Growers (and I) rest assured that the recommendations of the manure management team have been intensively reviewed to be in compliance with the BMP's each location & field has to follow in order to be in compliance. I have no doubt that the West River Dairy location follows & will continue to follow the same strict protocol that all the other locations know to follow as well. Their team, from upper management to field applicators all keep in communication on compliance along with rigid record keeping and submitting documentation to the proper entities. I know, because I have been a part of the process of these steps and their professionalism exceeds my expectations every interaction where we work together to make plans for a grower.

They don't take the requirements of any of the permitting process lightly and anyone who wants to work with them in executing the agronomic needs at hand, also knows that they are to follow the guidelines. Even their haylage & silage operations are run extremely safely & efficiently so that there is

very little room for error or injury or damage otherwise. My brother runs a cart for an operation that carts for silage at one of the locations and he said that safety, efficiency, cleanliness & communication are all keys to a successful season that Riverview stresses. If you've ever toured any of their facilities in the RRV, Steven's, Swift, etc you already know they run a clean, organized & first class operation in the care they take with their animals, the cleanliness of the facilities inside and out and also by the way everyone carries themselves in a kind & professional manner.

The obvious characteristics of Riverview is that if you know how this all works; you know they they or any other operation for that matter cannot set up an operation like the West River Dairy without following ALL of the proper protocols and procedures legally. The key thing that most people overlook, assume or just flat out do not have experience with is the fact that they also prove to me and others that they not only follow their legal obligations but they follow their moral obligations to the environment, the local communities, their personnel, their farming neighbors & to the generations yet to come. I believe that is just as important to know about them that I hope more people get to experience and know about the Riverview people. Thank you for your consideration of supporting & approving the West River Dairy. Kelsey VanOverbeke

Tyler Young **Letter 806**

Growth is necessary as demand rises

Sheyla Ramirez **Letter 807**

To whom it may concern.

I want to express my support to the West River Dairy Expansion project; I have known about Riverview for over 8 years. This includes touring their farms in different states.

This opportunity has given me an insight of Riverview, the more I know about who Riverview really is, the more I realized it is something good and not only for the employees or vendors who work directly but also for the communities, townships and counties where Riverview operates.

No matter the circumstances Riverview sites comply with the regulations, laws and even go beyond, sites are clean, organized, with minimal flies, minimal odor even during manure pumping season in the fall.

I have friends, family and people impacted by the opportunities.

Thanks,

Sheyla J Ramirez

Brian Eisenschenk **Letter 808**

I've been working in the dairy industry for 25 years, Riverview is a top notch company. Expansion is necessary to keep up with the demands of the industry. I'm in favor of their expansion!

Carolyn Anderson **Letter 809**

This proposal is harmful to man and beast. We all need clean water and air. Please do not permit this.

Mary Jo Forbord **Letter 810**

Dear MPCA,

I am writing to formally request that the MPCA mandate a full Environmental Impact Statement (EIS) for the proposed West River Dairy expansion. As the largest livestock operation in Minnesota's history, the cumulative environmental risks—specifically regarding Contaminants of Emerging Concern (CECs)—far exceed the scope of the current Environmental Assessment Worksheet (EAW).

The Minnesota Department of Health (MDH) and the MPCA classify hormones as CECs. MDH data indicates that these substances already affect 90% of tested Minnesota lakes, and a U.S. Geological Survey study found the Mississippi River in Minnesota has the highest rate of "feminized" fish--male fish that develop female characteristics, such as eggs in their testes. The cause is attributed to endocrine-disrupting chemicals (EDCs) that act as estrogens, causing sexual disruption.

The scale of the West River Dairy expansion poses the following significant risks:

- Hormone Output: Pregnant and lactating cows produce large amounts of estrogen and related hormones. An 18,000-cow herd produces approximately 15 pounds of estrogen daily. Hormones are potent in very small concentrations. In addition, large dairies routinely use synthetic hormones to maximize lactation and control the cows' reproductive cycles, which further increases this biological load.

- Environmental Persistence: Estrogens in dairy wastewater are notably persistent and often fail to biodegrade under the anaerobic conditions found in manure storage lagoons.

- Public Health Implications: These hormones bioaccumulate in the food chain. Human exposure through contaminated drinking water is linked to impaired fertility, developmental malformations, and hormone-sensitive cancers.

- Private Wells: Rural residents relying on private wells are particularly vulnerable. No one monitors our wells for safety, so the full financial and health burden of testing and harm falls directly on us. Most municipal systems are incapable of filtering out these contaminants, so well owners are particularly disadvantaged by lack of regulatory oversight to keep our water safe. We deserve better. Our state prides itself on its water, pure water at that. If our water is no longer drinkable because others have profited from making it so, regulation and justice must prevail.

Having grown up along Shakopee Creek in the adjacent watershed to the proposed expansion, I have witnessed the degradation of local watersheds firsthand; the Shakopee is now a designated critical nutrient hotspot. Nearby is Dublin Dairy, one of Riverview LLP's 8000 cow dairies. Do we have CEC data for Shakopee Creek? A blueprint for protecting our water and preventing contamination may become apparent if we choose to look. Perhaps we have hardly begun to accurately assess the environmental impact of dairies of this size, placing them ahead of CEC data collection and the safety of our drinking water.

If this expansion is green-lighted, hormones and endocrine disruptors will enter our water system at an unprecedented scale, affecting us all. Along with raising already elevated levels of nitrogen, phosphorus, and E. coli, the West River Dairy expansion represents a permanent threat to regional water security. I urge the MPCA to require a comprehensive EIS to study these cumulative impacts.

Sincerely,

Mary Jo Forbord

Prairie Horizons Farm LLC

John Kopp **Letter 811**

I have been working alongside Riverview as a vendor for many years. They take care of everything the right way and have a very clean way of doing it. I support this expansion because it is good to see dairy growing in our community's. They also provide back to local farmers in many ways. Until you get the chance to work alongside the employees and see how well it is ran, I think it is best to keep positive attitudes towards expansions in the dairy industry.

John Kopp

Judy Gregg **Letter 812**

The damage that this facility would do to the environment...especially to the water quality should be enough to deny a permit to this organization. The unnatural environment created for these animals to live in sounds like an animal concentration camp. Our state should not be condoning this kind of treatment. Please deny this request for expansion.

Isidro Granados **Letter 813**

MPCA,

I have been working with Riverview for more than 16 years, as a First Generation American, this kind of projects have provided an unvaluable opportunity for my daughter who is studying college at SDSU, my two boys who are also Americans and one is working, and another one is studying here in the USA and my wife also who works here.

The sites I have work at through the years are clean, organized, with minimal flies and odor, the integrity and ethic is part of part DNA, also we care about the land, water and future for all Americans.

I support the expansion

Isidro Granados

Erika Gilsdorf **Letter 814**

Hello,

I find it interesting that you write 'we value your comments'. I have been attending numerous county meeting, shared videos about public comments against CAFOs, attended numerous meeting and discussions and the opinion of people don't reach the decision makers interested in purely money and profit. I find it disgusting and appalling that treating livestock in these manners of concentrated animal feeding operations where animals are trapped inside, the manure is collected below them because they never leave and their conditions are horrific. But, why should we care about animals? It's about money, right? Profit, right? What about the environment? Why should we care about that? It's about money, right? Profit, right? Do we need to care that the animal waste has to go somewhere and that regulations of how that is handled safely without impacts to pollution, harm to our rivers, lakes and groundwater is not even close to being safe and regulated? What about setting a precedent for this area that prioritizes care of animals, care of our waters, care of our communities...does that matter? Or, is it profit and greed all put under the nice umbrella of 'economic growth' and 'feeding the people'. There are better ways that don't harm animals, land, water, and yes...people. These large operations are overtaking small family farms, bringing traffic, pollution, roads and extra impact to local community structures. Is that what you want? It seems so. The voice of a CAFO owner, seems to continually outweigh the voice of many. And, animals don't have a voice so it is as if they don't count. It's disgusting. It's time that MPCA takes a stand on stopping the pollution. What?! Stopping pollution? That's crazy. It seems like you're

open to discussing pollution and degradation of our natural systems and the animals that we live and rely on for a company's growth and expansion. This is not just one decision but the tipping point of many more to follow. It's like an open door saying, hey, all you CAFO's, come on over to West Central Minnesota. They don't have the courage to stand up and demand something different. A better way. It's a free for all to use and abuse and when we've used it up, maybe we'll move up to Canada? I mean, Iowa is already taking it in the shorts with their CAFO's. I'm fairly confident no one has read this. But, if you have, seriously, do not let this expansion happen. It's disgusting, appalling, and needs to be rejected. Please, please, stand up for what is right and just to our animals, our communities, and our lakes, rivers and natural world. There is no turning back from this decision.

Yaasika Quist **Letter 815**

In 1995, Minnesota had 9,000 dairy farms. By 2025, that number has fallen to 1,605. As farms have grown larger, many small family dairies have disappeared, and our rural communities feel that loss in real ways.

Among the organic farms, only two remain, and both are struggling.

Riverview says this 18,500 cow facility would create 40 jobs. Yet the same number of cows could support around 70 conventional family farms. Those are families who hire local help, support small businesses, build relationships, and keep small towns alive.

I do have concerns about the environmental impact of concentrating so many animals in one place. But I am also concerned about what is lost when family farms disappear. There is something so good about families caring for animals, tending the land, and working together with purpose. Family economies grow strong families and strong communities.

Please consider supporting family farms over corporate agriculture.

Thank you!

Carla Anderson **Letter 816**

I encourage the MPCA to complete an Environmental Impact Statement (EIS) for the West River Dairy Expansion. I was born in Morris (Stevens County) and lived there until I was 20. I have visited the area most months of my life to see family and friends.

I am concerned how such a large concentration of animals will impact water (groundwater impacts from greatly expanded pumping and surface water impacts from manure),quality of life in the area (e.g., increased truck/heavy equipment traffic, air quality, noise), and pressure on smaller on farms.

Randi Wingert **Letter 817**

To whom it may concern:

I am a small family dairy farm owner in MN. I am writing to hopefully make someone understand that expansions like River View should NEVER be allowed. River View is not a family farm they are a factory. They pollute and destroy the water supply at that capacity, they destroy farm land with no care, they destroy roads, they do not supply local revenue or employ locals. They push cows to unnecessary limits with no care to their well being.

Farms of this magnitude are ridiculous and reckless. They put real families, with real farming abilities and ties out of business. We do not need factory farms we need real dairy farmers, real families, real

caring, hardworking dedicated small town farmers who are dedicated to their families and their communities.

This is the time to stop all this before its too late, you want to see the real impacts of this talk to the real farmers, it's time to end factoryfarming.

Patricia Bouta **Letter 818**

I think an Environmental Impact Statement needs to be required for the West River Dairy Expansion so that everyone would know the impact to the water, land, neighbors, and other dairy farmers.

That large of an operation would change the land and the water. The large amount of manure it would produce and being used as fertilizer could lead to nitrates leaking into groundwater.

There are several rivers and other waters in the area.

There would be risks of manure spills and there have been manure spills at other operations. There would be excessive smell (stink) and it would lower the land values in the area for miles around.

Riverview has enough dairy operations in Minnesota already. It is already difficult enough for farmers to compete and this would make it worse, and be a detriment to the land and water.

Guido Niederoest **Letter 819**

There is no reason why this mega project should be allowed without an independently performed Environmental Impact Statement. There are a number of rivers and waters in the area that would be negatively impacted by a manure spill as has happened in other operations of this size. The local population in the area would be impacted by the excessive smells on a regular basis with these smells drifting to heavily populated areas as well. Property values would also be impacted negatively. This large of an operation would also make it more difficult for local farmers to compete being that it will have such a large number of dairy cattle.

Rodrigo Machemehl **Letter 820**

I've worked with Riverview, know their expansion projects, and I really could saw the commitment and how serious the project is. Critical backbone of our community, generating jobs, and helping the economy!

Sonja Trom Eayrs **Letter 821**

Dear Mr. Peterson and Members of the MPCA:

I submit the following comments in support of an environmental impact statement (EIS) for expansion and future development of large animal projects, such as the one proposed by Riverview Dairy.

I grew up on our family farm in Dodge County, Minnesota. I am an attorney in Minneapolis and am actively involved in the day-to-day operation of our family farm. My family has been on the frontlines for years fighting corporate agriculture and installation of industrial factory farms.

Today, our family farm is surrounded by 12 swine Confined Animal Feeding Operations (CAFOs), aka factory farms, housing an estimated 30,000 hogs in a 3-mile radius. These industrial factory farms collectively house an estimated 12,000 animal units. See, attached Animals to Animal Units Conversion, Iowa DNR 01/2021 (Number of head (30,000) times equivalency factor (.4) equals animal units (12,000)). Although area factory farms in a 3-mile radius collectively exceed 12,000 animal units, every industrial

operation cleverly escaped environmental review. Every factory farm houses animals just shy of one thousand animal units-the threshold for even minimal environmental review.

My family has had a front row seat to the corporate takeover of rural America. Our story is captured in my book, Dodge County, Incorporated: Big Ag and the Undoing of Rural America (Univ. of Nebraska Press, Nov. 2024). See, https://sonjatromeayrs.com/ My book weaves together my family's struggles with the larger realities of corporate livestock production in the United States: the pollution, the waste, the metamorphosis of thriving, verdant countryside into bleak commercial zones.

In the comments below, I briefly address three topics, including: (1) Dangerous nitrate levels; (2) Corporate consolidation and the decline of rural America; and (3) Harassment on the prairie faced by my family and other frontline families fighting corporate agriculture.

Please incorporate my comments and the noted attachment in the public record.

Dangerous Nitrate Levels

According to EPA records, "The drinking water of millions of Americans living in or near farming communities across the country is contaminated by dangerous amounts of nitrates and coliform bacteria from fertilizer and manure widely used in agriculture." Private wells in farming communities are routinely found to have nitrate levels above the municipal drinking water safety threshold of ten parts per million. This high bar is based on when levels become potentially fatal to infants, but drinking water at even half this limit increases the risk for colon, kidney, ovarian, and bladder cancers; miscarriages; thyroid disease; and neural tube birth defects.

A 2017 report showed that samplings of private wells in Dodge County between 1995 and 2016 found that 21 percent of private wells contained nitrate "above background concentrations," and 7 percent contained nitrate above the legal drinking water limit of ten parts per million. The county acknowledged that contamination was more prevalent in areas of Dodge "with shallow soils over limestone and over sand aquifers." I'm baffled that even with this contamination data, the county continues to permit feedlots over karst. Residents of Berne in northern Dodge, where karst topography dominates, fought hard against the first large swine CAFO in 2006. The community lost that battle.

In the years that followed, my late husband's mother, Ruth, along with other Berne residents, watched as the nitrate levels in her private well shot up. Ruth encouraged family members to drink only bottled water at the farm. In the fall of 2013, she succumbed to cancer. For years, my husband's family participated in the state's nitrate-monitoring program and dutifully submitted water samples to the local environmental ser vices office in the spring and fall. The results were damning: nitrate levels regularly came back between twenty and twenty-seven milligrams per liter, or three times the municipal drinking limit. My husband's family spent several thousand dollars to install a reverse osmosis system that removes contaminants from the water.

While pigs in the Berne area's factory farms drink pristine water drawn from a well drilled 480 feet down through multiple layers of porous limestone to the Prairie du Chien aquifer, residents drink water filled with nitrate from the pigs' manure. Today, locals refer to County Road 8, the main thoroughfare north of my husband's family farm, as "Cancer Road."

County Road B garnered international media attention following a 2023 news report that highlighted the nitrate contamination found in area water supplies. The reporter, Keith Schneider, spoke with four families who shared stories of twelve cancer cases and seven deaths concentrated along a short stretch of this single rural road. "Though the causes of the cancers are not proven, a key suspected culprit is

believed to be the elevated levels of nitrates that have contaminated the drinking water for County Road B families," Schneider wrote.

Contaminants deriving from livestock manure are also found in public water systems. A 2020 study found that the drinking water of an estimated half million Minnesotans is drawn from groundwater with elevated nitrate levels, citing "fertilizer and manure that runs off from farm fields and seeps into groundwater" as the primary contamination source. In this and other ways, feedlot pollution is both a localized and a dispersed problem. Groundwater leaching impacts public water supplies in neighboring towns and cities, and pollution in local rivers and streams is an uncontained hazard.

Data from the EPA shows that as of 2018-19, 42 percent of the length of lakes and streams in the United States had elevated phosphorous levels, and 44 percent have elevated levels of nitrogen. The EPA attributes these elevated levels primarily to fertilizer and manure runoff. In Iowa, where hogs outnumber people by seven to one, well over half of all waterways are impaired. The widespread degradation of waterways not only impacts people's health, well-being, and leisure activities but also causes massive fish kills and contaminates the fish that we eat. This is, of course, only a broad summary of the impacts of concentrated livestock agriculture on wildlife and the health of ecological systems.

In 2019 the Minnesota Pollution Control Agency issued a report about pollution in the Minnesota River, which eventually flows to the Mississippi. The report identified livestock manure runoff as a primary culprit behind an emerging environmental emergency that, per local press coverage of the report, is "degrading our superstar Minnesota River to sewer status." Worryingly, while the report indicated that the area of southern Minnesota included in the study contains 135 federally defined CAFOs (those holding a thousand-plus AUs), it did not specify the locations or the sizes of these feedlots-information that the public deserves to know. It also acknowledged that "while a full accounting of the fate and transport of manure was not conducted for this project, it is clear that a large portion of it is ultimately applied to the land surface and therefore, this source is of significant concern." So the MPCA can identify the pollution and deduce that much of it derives from factory farm manure, but lacking oversight capabilities, the agency is unable to pinpoint the most serious offenders or hold them accountable if identified.

Another MPCA study concluded that in Minnesotan regions dominated by agricultural land, "just half or fewer" of the area lakes "do not fully support swimming" due to excessive phosphorous levels, which are likewise caused in part by manure runoff. Our beloved Minnesota, the "Land of 10,000 Lakes," has become the land of 4,600 impaired waterways. The meatpacking and dairy industries use local rivers and streams as their own personal toilet.

Corporate Consolidation and the Decline of Rural America

The proliferation of industrialized livestock operations has significantly impacted rural farm communities in several states during the first decades of the twenty-first century, including Minnesota. The raw data tells the story well.

The EPA estimates there were more than 17,000 large CAFOs (buildings holding more than a thousand AUs) in 2012 compared to 6,600 in 1995. That's nearly a threefold increase in less than seventeen years. Looking at hogs specifically, the data coming from Iowa, the top hog-producing state, is alarming: CAFOs increased fivefold between 1990 and 2019, with 94 percent of this growth attributable to hog barns.

The straight line between this corporate consolidation and the extinction of independent farmers is easy to follow. Since the mid-1990s, 70 percent of hog farmers have gone out of business. The meatpacking conglomerates seized near-total market control, while their loyal contract farmers have captured an ever-dwindling proportion of profits. In the mid-1980s, thirty-seven cents of every dollar that Americans

spent on food went back to farmers, but by 2019 that had decreased to fifteen cents of every dollar. More than half of all farmers have lost money every year since 2013.

Meanwhile, the corporate meatpackers enjoy profits of a previously unimagined scale. Smithfield Foods saw sales increase tenfold between 1990 and 2005 thanks largely to its corporate strategy of buying up competitors and then maneuvering to fix prices and cut off access to a competitive marketplace. In 2013, in what was the largest-ever Chinese acquisition of a U.S. company, the Chinese company WH Group gained control of Smithfield.

Looking at the bigger picture, consolidation is the norm across major agricultural commodity groups. Dairy, soybean seed, and corn seed are other commodities that swiftly consolidated during a similar time frame. Between the years 2005 and 2010, eighty thousand independent farms in the United States disappeared. Then between 2011 and 2018, an additional hundred thousand farms in the United States were lost. In 2019 a feature article in Time about that year's farm bankruptcy crisis put forth a chilling proposition: "Farmers have always talked of looming disaster, but the duration and severity of the current crisis suggests an alarming and once unthinkable possibility-that independent farming is no longer a viable livelihood."

What's so worrying about today's corporate ag economy is that as profits soar and corporations boast to shareholders about outputs and efficiencies, the entire system is a house of cards. The droughts and severe weather associated with climate change have pummeled crops. Trade wars and unstable commodity prices continually stress the system. Thanks to short-sighted federal policies promulgated under pressure from Big Ag corporations, large farmers rely heavily on subsidies. During the agriculture crisis that former president Donald Trump's trade wars played a role in triggering, $16 billion in aid went to farmers, and 40 percent of farm income in 2018 derived from federal aid and insurance.

Farm subsidies have always been an important governmental tool for protecting producers and consumers from the inherent unpredictability of seasonal yields. Yet when subsidies are overused and funneled primarily to the wealthiest farm operations, the result is a highly unstable, top-heavy system that has no incentive to solve the pressing problems-such as climate change-that cause low and unpredictable yields.

As small farmers left the industry en masse, what has been the impact on rural communities and economies? One of the best efforts to probe this issue is Food & Water Watch's 2022 study of counties in Iowa that compares rural counties with high CAFO density to rural counties with both low CAFO density and more small farmers. The results show that between 1982 and 2017, personal income rose significantly in Iowa; even in the average rural county, income rose 41 percent. But in the top hog-producing counties, personal income fell by 8 percent. The report also found that while retail businesses in Iowa declined by a modest average of 2 percent across the state, counties with the highest CAFO concentration saw a decline of 33 percent.

Meanwhile, the study found that small, independent farms have the opposite impact: counties in Iowa with the highest proportion of small farmers actually experienced retail business growth, beating the state average. (The economic vitality of small farms reminds me that hogs used to be called "mortgage lifters" because raising a small number of hogs on a diversified farming operation brought in some extra cash.)

CAFO approval in Iowa is all but assured by a combination of lax regulatory procedures, county-level industry infiltration, and state and national lobbying efforts. In this system, 97 percent of requested CAFO permits in Iowa are approved. This overt friendliness to CAFOs is a main reason why Iowa produces more pork than any other state, surpassing Minnesota and North Carolina, which both have

more regulations on the books. That's good for the meatpacking conglomerates but bad for the people of Iowa. In 2019 a senior official at the Iowa Farm Bureau predicted to ag journalist Austin Frerick that "most rural communities will soon disappear." Frerick observed that the official seemed "accepting of this fate, even a bit happy about it."

CAFO proliferation has disproportionally impacted communities of color and marginalized communities. African American, Hispanic, and Native American people are significantly more likely to live within three miles of a hog CAFO in North Carolina-a pattern that likely exists in other states as well. Writing for the Sustainable Development Law and Policy journal, attorney Christine Ball-Blakely showed that communities lacking political power, resources, and education are targeted as sites for CAFO development. Targeted communities "lack the resources to leave compromised areas, where they are trapped by decreasing property values and a plummeting quality of life," Ball- Blakely wrote.

A CAFO's impact on property values depends on the size of the CAFO and whether the impacted property is downwind or upwind from the operation. The larger trend, however, is clear: factory farms cause surrounding property values to decline. A 2015 analysis of appraisal values estimated that properties within three miles of a CAFO lose 26 percent of their assessed value, and properties that are very close to a CAFO-within a quarter mile-lose as much as 88 percent of their value.

This impact has a devastating ripple effect in rural communities, where many farm families are asset rich but income poor. The notion of losing a home's value is so frightening that families are forced to choose between taking a "wait and see" approach or being proactive by selling their properties and moving away before a CAFO goes up. I've seen this happen time and again. I'm reminded of a small farmer and self-employed business owner in Goodhue County, Minnesota, whom I will call "Jack." I've contacted Jack several times regarding his community's resistance to area factory farms. Jack asked me to use a pseudonym, as he fears retaliation against his family and small business.

In 2015 he and his wife purchased a rural home on a few acres in Goodhue, an ag county adjacent to Dodge. Ten months after moving into the home with their children, they observed a hog CAFO going up nearby. They soon learned that while they were negotiating the purchase of their home, the Big Ag-friendly Goodhue County Planning Commission had approved the adjacent factory farm by a unanimous vote.

Jack also discovered that the previous owners, who had lived there for many years, were aware of the planned development. No law requires sellers to notify potential home buyers that a feedlot has been proposed or approved in the immediate area. The decision to cut and run before a CAFO is built and to not disclose such information-shuffling the property off to unwitting buyers-is yet another aspect of the factory farm takeover that corrodes social and community relationships.

After the facility went up and additional CAFO applications were submitted in Goodhue County, Jack joined with other neighbors to monitor the air quality near the border of the feedlot's property. The results showed concentrations of hydrogen sulfide far above state safety standards in the area near Jack's home. He is concerned for his kids, who frequently play outside.

Jack's family has been living in Goodhue County since the late 1800s. His father owns a small dairy operation nearby, but he's facing the decision to shut down. The operation is now surrounded by CAFOs, and the nitrate levels in his well have steadily increased. Soon he may be unable to give the water to his cattle.

The story of Jack's family is typical. In CAFO country, a small handful of feedlot operators profit, while their operations are under no legal obligation to abstain from rendering neighboring small farms

inoperable and neighboring residences unlivable. Reflecting recently on his family's experience, Jack said, "The industry divides communities and divides families.

Harassment on the Prairie

My family has paid a significant price for speaking out against industrial agriculture-facing years of harassment and intimidation. Fresh bullet holes riddled the stop sign just a few feet from where my brother and I had been picking weeds. Constant garbage left in the roadside near our driveway, harassing phone calls, and nighttime intrusions remained a regular occurrence. False telephone calls to the Dodge County Sheriff's Office, not to report some infraction, but to put the heat on me personally and get me to shut up.

These are just a few examples among hundreds, perhaps thousands, of harassment, intimidation, and outright threats and violence among neighbors that have become all too common in farm country today. The vast majority of these incidents go unreported because the threats are effective. People decide to stay quiet when they realize that speaking against factory farms will put their jobs, businesses, and families at risk. Livestock operators make it very clear that one's position on the latest factory farm development is a purity test that measures the loyalty of the locals.

Dead animals left in mailboxes and on front stoops; death threats, raised rents, social ostracization; fires set in front yards; threats to local businesses; getting fired from your job-these experiences are common among rural residents who speak out against new CAFOs or proposed feedlot expansions. When choosing a site for a new CAFO, the industry targets remote rural areas often inhabited by poor or undereducated residents who are likely to either drink the industry Kool-Aid or lack the resources to effectively fight back. In an industry game of Whac-a-Mole, these isolated battles-strategically targeted in remote or impoverished locales-are part of a systematic strategy to permanently anchor the corporate Big Ag factory farm economy.

We need immediate action in Minnesota to address corporate livestock production and the resulting pollution and waste. It is incumbent upon the Minnesota Legislature to halt corporate consolidation and further decline of rural Minnesota. We also need stronger laws in place to address and punish violators for intimidating and harassing frontline families fighting corporate agriculture, like mine.

Requiring an EIS for large animal projects, such as the proposed expansion of Riverview Dairy, is a start in the right direction. An EIS will limit the proliferation of large Confined Animal Feeding Operations (CAFOs), restrict further corporate consolidation, and prevent further decline in rural Minnesota.

Very truly yours,

Sonja Trom Eayrs

Laura Thielke **Letter 822**

Please require a full Environmental Impact Statement for the proposed West River Dairy Expansion. The thought of over 20,000 animal units in one location is blowing my mind. I have several concerns. Will that many animals in one place require more vaccines, antibiotics, and disinfectants per animal compared to an average herd? Will the cows consume so much water that the aquifer that feeds the well for my residence will dry up? I can't afford to pay for a new, deep well. How likely is manure spillage and contamination of streams and rivers and other people's drinking water? Can the dairy be held liable for other people's contaminated or dry wells? How far will the wind carry the manure smell and feed dust generated at the dairy? When the owners of nearby farm sites want to sell their property, will they have trouble finding buyers? Will local property values decline? Will the additional truck traffic to haul in

haylage, silage, and other feeds and to haul out milk and waste damage the nearby roads, increasing the property tax burden of Stevens County residents and nearby townships' residents? Will local farmers haul more grain to the dairy, so ethanol plants will have to buy corn from farther away, increasing the need to repair roads in the region? Will small family dairy farms all go broke? Since this livestock operation would be nearly double the size of the next largest livestock operation in Minnesota and huge compared to an average Minnesota dairy, please give this permit lots of scrutiny.

Kim Larson **Letter 823**

ATTN: Charles Peterson

My name is Kim Larson and I am a farmer in Kandiyohi County, MN. My full background is not only an agricultural producer but the experience as an agricultural regulator, as well. In the early 2000's I was selected to develop, and carry out the duties as the initial Delegated Feedlot Officer for Kandiyohi County. Over the three years that I devoted to the position, I developed a unique perspective of both sides of the process, and I believe that experience benefits my assessments in this discussion.

In preparation, I committed myself to reviewing the entire Environmental Assessment Worksheet (EAW). Beyond the 72 pages posted online, are the 26 categories of Attachments totaling hundreds of pages.

Associated Agency Reviews Confirm No Significant Concerns

The State Historic Preservation Office found no properties listed on the National or State Registers and no known archaeological resources that would be affected by this project. The DNR Natural Heritage Review found no ecologically significant areas along with no State-listed endangered or threatened species on the project site. The review within the route of the water pipeline returned with *"No Further Review Required"* across all categories. In response to Agency comments from MPCA and the State Archaeologist, Riverview voluntarily removed certain manure application fields from the manure plan, demonstrating responsiveness.

Water Utilization

The EAW is explicit in backgrounding the fact that the well that will supply the West River expansion originally received permitting for 452 million gal/yr. Riverview is reducing that initially granted appropriation to 226 million gal/yr. It would be hard to ignore the extraordinary effort that Riverview put forth in being creative enough through this expansion to significantly reduce the total permitted water appropriation capacity in this aquifer. If a 452 million gal/yr appropriation was initially found to be sustainable in this location, an appropriation of half that amount cannot logically constitute a significant environmental impact, especially considering the on-going regulatory measures incorporated into the DNR's permit.

DNR Comment Letter (March 17, 2026) Inaccuracies

It is puzzling to understand the DNR's statements that the EAW had not considered any impacts on the Pomme de Terre River. EAW Section 12.B.3 (pg 34-37) specifically discusses impacts to the Pomme de Terre, including detailed pumping restrictions based on stream flows (Tables 16 & 17). Included under Section 12.B.g.4 are multiple points addressing pumping restrictions applied to avoid indirect impacts. The letter further indicates that groundwater is *"limited"* in the project area. However, this would be in conflict with their previously detailed review of the aquifer in this location where the DNR found water usage, twice the currently proposed appropriation, to be fully sustainable.

EAW is Comprehensive and Complete

This EAW is far beyond a typical livestock EAW review. As I pointed out initially, there are literally several hundred pages of technical analysis covering ground water, surface water, air quality, natural resources, and cumulative effects. Under Minnesota law, an EAW is intended to be a *"brief document"* designed to set out *"basic facts"* about a project. I believe that it is self-evident that this EAW published by MPCA, greatly exceeds that standard in advance, as it appears that the MPCA has already produced an EIS level of information with respect to this project.

Furthermore, under Minnesota law (Minn. R. 4410), an EIS is required only when there is potential for *"significant environmental effects".* It does not reference any prerequisite for an EIS determined on the basis of an animal unit (A.U.) threshold. As Minnesota AgriGrowth noted in their comments, the purpose of an EIS is to assess environmental impacts, not create public policy on the appropriate size of dairy farms in Minnesota, as that should obviously remain with the representation of elected legislators. Finally, under Minnesota Rules, an RGU must consider *"the extent to which the environmental effects are subject to mitigation by the ongoing public regulatory authority."* Within this EAW, multiple layers of ongoing regulatory …. DNR water appropriation permitting, MPCA individual feedlot permitting, and NPDES zero-discharge requirements …. all serve as specific, targeted mitigation measures that Minnesota courts have recognized as sufficient enough to validate the findings for potential environmental effects.

Consideration of an Individual Permit

The development of an individual permit for this project further shows that the Agency has all of the protections and tools in place to ensure this project is fully protective of the environment, and that no potential for significant environmental effects could be found. As a former County Feedlot Officer, I recall the numerous times in our County's permitting process that when a specific item of concern was identified, we did our best to prevent *"regulation overreach"* by targeting those items with *focused mitigating conditions* that would provide the *specific protection* that is sought.

Conclusion

Upon thorough review, I would encourage a decision by the agencies involved to approve the West River Dairy expansion. With the rigorous safeguards for environmental security well documented in this EAW, the request for an EIS would be considered overreach. And finally, it would be regrettably unfortunate if the process of environmental review for livestock proposals morphed into …. *an act of prohibition.* Respectfully,

Kim Larson

Kandiyohi County

Paul Kostboth, A1 Development Solutions — Letter 824

Dear Mr. Peterson,

My name is Paul Kostboth, and I am the Founding Partner of A1 Development Solutions, a firm serving agricultural operations in Minnesota, including Riverview. I am writing to express my support for the proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we rely on a strong and stable livestock industry. Operations such as Riverview play a critical role in generating consistent economic activity, supporting local employment, encouraging investment, and enabling businesses like ours to grow and reinvest in the communities we serve.

The proposed expansion represents a meaningful economic opportunity for the region. It will increase demand for local vendors, support both construction-related and long-term employment, and contribute to the continued vitality of rural communities that depend on agriculture.

Based on our direct experience, Riverview is a professional and reliable partner that makes positive contributions to the communities in which it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects of this nature are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can provide jobs, services, and long-term economic stability.

Given the rigor and thoroughness of the state's environmental review process, we believe that an Environmental Impact Statement (EIS) is not necessary for this project. I respectfully encourage your support and approval of this important expansion.

Sincerely,

Paul Kostboth

Founding Partner

A1 Development Solutions

Terry VanDerPol **Letter 825**

I believe this expansion to the largest livestock operation in the state warrants an Environmental Impact Study to ensure a robust examination of all the impacts on the land, water and community.

1. Water use. 226 million gallons per year is huge. Can the acquifer sustain that draw without negatively impacting other users? Will Riverview's draw and the accessibility of water for others be monitored? What are the likely impacts of accelerated climate change? Can Riverview count on the capture part of their projected water supply and do they have a plan B as rainfall becomes more and more variable?

2. Projected amounts of liquid manure will require 13,200 acres of land. That's going to require substantial distances for the manure to travel especially in an area with quite a few CAFOs already. And, the proximity to numerous Waterfowl Areas is concerning.

3. On the socioeconomic impacts there are concerns including and beyond driving family dairy farms out of business. In this time of accelerating climate change we are seeing increased transport of viruses from far flung places, new to this area. Covid should have taught us lessons about the dangers to our food supply concentration of production and processing present. Avian flu has already shown it has capacity to jump from birds to dairy cattle to humans. Caution ought to be the coin of the realm regarding increasing animal concentration.

This expansion needs the robust review and Environmental Impact Study can provide.

Sam Cnossen **Letter 826**

Good morning—

I haven't read every comment that has been written here, but I wanted to share a few thoughts based on my own experience. I'm 63 years old, and I've had my share of failures along with some real blessings. I have a wife, children, and friends in this community, and I respect the people who live and work here. I am grateful to have this opportunity.

I've been involved in the dairy industry my entire life—my dad was a dairyman. Over the years, I've owned my own dairy, worked for other dairymen, and spent time with a company that helped dairies around the world manage operations using computers and software. Today I'm an owner and partner in Riverview, using what I've learned to support the people I work alongside every day.

My failures have helped shape me, and being part of Riverview has helped me grow as well. We are a large operation, and I understand how easy it can be to see things as "them" and "us." But please know this: we are a group of owners and partners, and each of us is a person with a family.

We come to work every day thinking about our families and our coworkers—how we can help one another inside the company, and how we can do right by our neighbors outside of it.

Every one of us has triumphs, failures, and family. We work hard to maintain a culture of safety—not just for compliance, but because it is what is best for our people. Our core values—strong work ethic, spirit of humility, keep it simple, integrity, and candor—are displayed on our common walls as a reminder of who we strive to be.

When we build a new facility, we do it to provide for our families and to create opportunities for others as well. We design our sites with safety, comfort, and care in mind—for our people, for the animals, and for the environment. We follow environmental guidelines and regulations closely, and we use best practices to carry out this work responsibly.

This project is an opportunity to create more good jobs in a place where people can build a stable life and raise their families. Some of those employees may be coming from other countries, and I'm proud our community can be part of giving them that chance. I also want to invite you to meet us personally, take a tour, and see for yourself what we do. And if you see us around town, please feel free to stop and visit—we are always willing to talk.

If you would like to hear directly from us about what is being proposed at West River Dairy, I would like to personally invite you to our informational open house. It is an opportunity to visit face-to-face, learn more about the project, and ask any questions you may have—including the difficult ones.

If you have concerns, please bring them. If you are supportive, I appreciate that as well. Either way, I'm asking you to come learn more about the project and have your questions answered. One thing that I know for sure is every single person that is doing any of the jobs that y'all have concerns about. They enjoy their job and will be doing that job to the best of their ability. This is a come-and-go open house—please stop in when it works for you:

Informational Open House — West River Dairy

April 9, 2026

5:00 PM–7:00 PM

Morris Armory

722 Iowa Ave.

Morris, MN 56267

Thank you for taking the time to read this. I hope you'll stop in, introduce yourself, and give us the chance to talk.

Thank you for listening.

Sam Cnossen

Lauren Blauch **Letter 827**

The current process that is outlined for permitting a dairy facility of this size in Minnesota is already one of the exhaustive and comprehensive processes in the entire nation to ensure our natural resources and our local communities are protected. Riverview has extensively shown to be an exemplary operator with respect for the processes that in place to ensure the rigorous Minnesota standards are met. Demanding an EIS would not only cause undue burden, but also set a terrible example that good dairy operators are now punished for growing and expanding their businesses when there is already an extensive process that needs to be followed and the EAW is a great tool that is nation-leading in its robustness as is.

Rinse Elsinga, Numidia Inc. **Letter 828**

Numidia has a strong and valued commercial relationship with Riverview. We work with Riverview as a trusted, professional partner and greatly value their long-term vision, operational standards, and commitment to responsible agricultural development.

We believe Riverview plays a pivotal role in the increased supply of high quality dairy, intended for both the U.S. domestic market and a range of export markets, strengthening reliable supply chains and supporting growing global demand for high-quality dairy ingredients.

From our perspective, the planned investment represents a positive and forward-looking development for production agriculture. It supports continued innovation, job creation, and economic activity, while enabling long-term partnerships across the value chain. Based on our cooperation to date, we have confidence in Riverview's ability to develop and operate this facility in a responsible manner, and we believe the project will make a meaningful contribution to the future of the dairy sector and the communities it serves.

Melanie Steele **Letter 829**

I am opposed to factory farming and request that you not allow this factory farm to move forward. In addition to the suffering Of animals, factory farms cause environmental harm and damage.

Corey Rost **Letter 830**

To Whom it may concern,

I have had the pleasure of working with Riverview Farms for the past six years, and during that time I have consistently been impressed by the professionalism, organization, and high standards maintained across their operations.

The Riverview Dairy organization is one of the most professional organizations I have ever worked with. Each dairy is consistently clean, well maintained, and operated with a clear commitment to quality and efficiency. This level of consistency reflects strong leadership and well trained staff throughout the organization.

Equally impressive are the employees of Riverview Farms, who have always demonstrated courtesy, professionalism, and a strong commitment to excellence. Their attention to detail and respect for best practices contribute significantly to the organization's outstanding reputation within the industry.

Based on my experience, they are a reliable, professional, highly capable organization that cares about their employees, the environment and communities around them.

Regards,

Corey Rost

Mitchell Coulter **Letter 831**

Dear Charles Peterson

My name is Mitch Coulter. I have worked in Minnesota agriculture my entire life. I grew up in west central Minnesota and I am very familiar with Riverview Dairy LLP. They care deeply about animal welfare and take the very best care of their animals. They educate the general public about their dairy operation. In my professional work representing the farming community they have always provided an open door policy providing tours for all sorts of public groups. They treat their employees with the utmost respect and they provide a positive opportunity for rural Minnesota.

I encourage the agency to support the growth of animal agriculture in the state and support the farming community. Rural Minnesota deserves a chance for opportunity! I strongly support the expansion of West River Dairy!

Sincerely,

Mitch Coulter

Annicka Westrich **Letter 832**

Due to the overwhelming amount of water and land that would be needed for this expansion and the amount of manure that would be created by this expansion, I'm strongly against it. Also, this expansion would push out even more small dairy farmers.

Ginny Halloran **Letter 833**

This is exactly the opposite of what should be happening with our farming operations. Bigger is not necessarily better, money/profit should not be the determining factor in advocating for the common good. We live in a democracy and it's about time we started acting like it. The Riverview expansion needs a environmental review taking into consideration humans are not the only sentient beings on the planet.

Todd Novy **Letter 834**

Knowing the Pomme de Terre river, its watershed and the surrounding communities I can only believe that expanding this business would be reckless and enormously detrimental (if not catastrophic) to both the environment and resources of the area. This proposal must not go forward.

Scott Herrly **Letter 835**

As a Minnesota resident I oppose factory farms. They are highly inhumane, a source of pollution, and put family owned farms at risk.

Dylan Reese **Letter 836**

ATTN: Charles Peterson

My name is Dylan Reese, and I am an employee of Riverview, LLP. I am writing in strong support of the proposed West River Dairy expansion in Stevens County — not just as someone who works in this industry, but as someone who grew up in this community and has seen firsthand the difference operations like Riverview make in people's lives.

I was raised in Hancock and have deep roots in this region. Growing up here, I watched agriculture shape nearly every aspect of life — the local economy, the schools, and the neighbors who stayed. It is a community I love, and one I hope to call home again. My goal is to move back to the Morris area and raise a family here, but that dream depends on whether places like this continue to offer the jobs, stability, and investment that make rural life viable.

I am also a proud former recipient of the Riverview, LLP scholarship, which made a profound difference in my college career. In addition to the scholarship, I was very active in 4H in my youth. Through 4H, I both witnessed and personally benefited from Riverview's generous support of the livestock auction and their donations to improve the fairgrounds.

Riverview's investment in local students and 4H is a reflection of the kind of company that truly invests in the people and places around them and one that genuinely gives back to the communities where they operate.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that depend on agriculture to survive and thrive. In addition to the local economic benefits, I along with many other coworkers are active in our rural churches, local charities, and school programs and events. Without an employer like Riverview, that encourages community involvement, I know I personally wouldn't be able to serve those organizations as I likely would not be in this small local community.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. For people like me who want to come home, expansions like this one signal that there is a future here worth coming back to. Continued investment in agriculture ensures that local businesses can provide jobs, services, and economic stability close to home — and that the next generation doesn't have to leave to find opportunity.

Based on my experience with this company and this community, I am confident that no EIS is needed, as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Dylan Reese

Earth day **Letter 837**

To whom this may concern.

I'm writing in opposition of this expansion at this site and all other sites owned by Riverview.

To be fair to everyone I think EIS needs to be done there and at all their other sites. If riverview is the company they say they are and many of their supporters claim they are. They should have no problem doing EIS.

Riverview is a huge environmental concern and a huge concern to our local communities.

Riverview is like a locust if they can't expand at west river they will move onto a different site they own.

I have saw comments from school boards saying they are welcoming this west river expansion. Ok so question here what do all these H2A/ people here on a work visa actually do for the schools and local communities and economy? Besides absolutely nothing!

It's the process of limitation when 1 of these riverview dairy sites is built in an area. Riverview doesn't wanna work with a bunch of smaller farmers. They wanna work with 1-2 farming operations that control the vast majority of the acres in that area. So begins the decline to our schools, our small towns and small town businesses and our rural area in a 5-7 mile radius of that site. When 1 of these sites is built in an area it's pretty much the death of that area because nobody wants to live to close to them sites and hardly no one can farm in that area in anymore but 1-2 guys who will over pay to buy and rent any amount of ground from 80 acres to 800 acres to have sowed up for the dairy. There is several farming operations in them areas that would love to grow their farming operations and bring in the next generation but can't compete land wise anymore against the guys that are heavily involved with the riverview dairy sites.

Just think if it wasn't for them riverview dairy's and their need to have all this ground for they dairy and their need to have all this foreign labor weather working at the dairy or all this foreign labor need for the guys that are heavily involved in the dairy's to farm all them acres. There could be a lot more local guys that are from generational farms that would be able to farm more or able to farm full time and our communities would be a lot better off instead of having 1-2 individuals and all their foreign labor trying to control it all.

Let that sink in!

I have noticed the area west of Willmar, MN has become a hotspot for riverview. There is 6 of them in 25 mile and east and west stretch and 6 miles north and south. That area was once really lively and peaceful but has become very stagnant because of riverview. Any ground that moves in that area that wasn't associated with the dairy's there as far as being used to grow feed on or put manure on will be and it's all going to select few individuals who are heavily involved with riverview. They have done absolutely nothing for that area but make a select few guys extremely big acre wise and drive out a lot of younger people and generational farms. Pretty soon that area will be a huge environmental risk if it is not already a huge environmental risk.

They had a manure spill at one of them sites in that area in the fall of 2024 that they cleaned up before they reported it to the Mpca. They claim it was 50,000 gallons of mainly water. 50,000 gallons of mainly doesn't cover an area of 60 plus acres and crust 1.5ft deep in a field and go into 2 separate drainage ditches a quarter mile apart.

For all the riverview employees and guys that are heavily involved in riverview(sold them land to build sites, manure pumping, grow a lot feed and very involved with the chopping) your comments should have little credit to them. What is good for you guys has been never been good for the neighborhood, neighbors and communities. It's only been good for your bottom line and your checkbook.

I have saw comments from people that it gives a younger person a chance come back home and farm. On what? Driving truck for someone with no advancement ever besides being a truck driver or a farm hand. People that wanna farm they would rather own and rent land themselves instead of being a truck driver and chopper operator for the extremely big riverview farmer. Pretty much death of a dream when one of these dairy sites is built to any younger people and generational farmers.

If riverview can keep expanding at an alarming rate there will nothing left to our rural areas and our natural resources will be gone and same with our communities.

I think it's time to put a stop them before it's all to late.

If they are the company they say they are and same with all their supporters they should have no problem doing an EIS. I think it would be ill fated if an EIS is not done.

It seems if you speak out against Riverview and their supporters you get a target put on your back and a bounty on your farming operation and all sorts other non stop harassment from riverview and their supporters.

Shelley Kremer **Letter 838**

Due to the scale of this project I believe a full environmental review is paramount. My dad grew up on Barrett Lake and my family has a home there now. We have seen the water decline over time and want to make sure this project doesn't cause the decline to escalate. A full and thorough review is needed before something of this scale is approved. The town needs 100% transparency before moving forward.

Diane Baum **Letter 839**

This expanision comes at a cost to our other smaller dairy farms in and around Morris, as well as sustainability of the aquifer to provide enough water for our future. Groundwater contamination is also a huge concern- I do not feel that this project is what is in the best interests of Morris and our surrounding communities.

Owen Anderson **Letter 840**

My name is Owen Anderson. I am writing in support of Riverview's proposed West River Dairy expansion in Steven's County. I have had the privilege of working with Riverview over the past two summers, most recently going through the intern program. The internship has provided me with a deeper appreciation of how much Riverview invests in the people and the local communities.

Growing up in Morris, I always knew that Riverview was important to the local economy, but working with Riverview showed me the behind the scenes of what it takes to provide that support.

A project like this will create new opportunities for people who are wanting to build their careers close to home.

Tim Trotter, Edge Dairy Farmer Cooperative **Letter 841**

To Whom It May Concern:

On behalf of Edge Dairy Farmer Cooperative and the dairy farm families we serve across the upper Midwest, I write to express our full support for the expansion of Riverview's West River Dairy in Stevens County, Minnesota.

Riverview is exactly the kind of operation that strengthens Minnesota's dairy industry. They are well-managed, community-oriented, and environmentally responsible. Their track record speaks for itself: innovative water conservation practices, industry-leading manure management plans, and an ongoing commitment to working with neighboring farms and local communities. These are not just good practices — they are the hallmarks of a company with a genuine and deep-rooted commitment to environmental stewardship.

Today's dairy producers operate in a vastly different landscape than previous generations. Advances in precision feeding, nutrient management, manure handling technology, and environmental monitoring have transformed what is possible on modern dairy farms. Riverview has embraced these advances fully. Their expansion, which has undergone thorough environmental review, reflects confidence in both science-based regulation and the capacity of modern dairy producers to exceed environmental standards.

I also want to speak to what Riverview means for its communities. Large-scale dairy operations like West River Dairy do not exist in isolation — they are woven into the fabric of local economies. Riverview creates meaningful opportunities for neighboring farmers through manure application partnerships, supports local businesses and service providers, and contributes to employment and long-term economic stability in the region. Their model of community engagement is a template for responsible agricultural growth.

Edge Dairy Farmer Cooperative trusts the existing regulatory process in Minnesota. The MPCA has the tools, expertise, and authority to evaluate this expansion thoroughly and to impose conditions that protect Minnesota's waters. We do not believe additional environmental review is necessary and would discourage any effort to weaponize the environmental permitting process to address unrelated economic policy concerns. The integrity of Minnesota's regulatory framework depends on it being applied for its intended purpose.

We urge the MPCA to move forward with confidence, grounded in science and data, and to support Riverview's expansion as a model of responsible dairy growth in Minnesota.

Sincerely,

Tim Trotter

Chief Executive Officer

Edge Dairy Farmer Cooperative

Tim Baumgartner, Edge Dairy Farmer Cooperative **Letter 842**

To Whom It May Concern:

I am writing in strong support of the proposed expansion of Riverview's West River Dairy in Stevens County, Minnesota. As someone who works with helping dairy farmers access and maintain proper permits for their farms, I am encouraged about the future of Minnesota's dairy sector and want to see growth in the industry occur responsibly, transparently, and in alignment with sound science-based regulation.

From a financial and regulatory standpoint, I believe the existing permitting framework administered by the Minnesota Pollution Control Agency (MPCA) is well-equipped to evaluate this project. The regulatory process in Minnesota is robust, and I trust it to appropriately assess environmental considerations and impose any necessary conditions. I do not believe additional environmental review beyond what is already underway is warranted.

Riverview has demonstrated the financial discipline and regulatory acumen of a well-managed enterprise. Their investment in advanced manure management infrastructure, water-recapture systems, and nutrient management planning reflects not only sound environmental practice but also strong business judgment. These are not afterthoughts — they are core to how Riverview operates. Their approach to reducing reliance on synthetic fertilizers through responsible organic nutrient cycling represents a meaningful benefit to surrounding farmland and demonstrates the kind of integrated thinking we want to see in Minnesota agriculture.

I am also aware that some comments have called for an Environmental Impact Statement based on economic concerns about competition within Minnesota's dairy industry. To be direct: environmental review a tool for evaluating environmental impacts, not for adjudicating market dynamics or farm size policy. Using the environmental review process to address broader economic policy questions would be

a misuse of that process and would undermine the credibility of Minnesota's regulatory framework. Legislation and rulemaking are the appropriate venues for those discussions.

Riverview's expansion represents a sound investment in Minnesota's dairy future. I encourage the MPCA to apply the science and data before it, use the full range of tools at its disposal to protect Minnesota waters, and proceed with confidence in the existing process.

Sincerely,

Tim Baumgartner

Chief Financial and Regulatory Officer

Edge Dairy Farmer Cooperative

Karalyn Indrelie **Letter 843**

Concentrated Animal Feeding Operations (CAFOs) are degrading Minnesota's air and water, while disproportionately harming rural and low-income communities through chronic public health impacts such as respiratory illness, contaminated drinking water, and reduced quality of life. These operations externalize their true costs onto the public, while the ecological damage continues to compound year after year.

Minnesota has an opportunity and responsibility to move in a different direction. Restoring native prairies and oak savannahs would rebuild soil health, protect waterways, sequester carbon, and provide critical habitat for pollinators that our food system depends on. These ecosystems once defined the region and can again serve as a foundation for sustainable land stewardship rather than industrial exploitation.

Meanwhile, the conventional dairy industry has been in structural decline for decades, surviving largely through repeated government bailouts rather than long-term economic viability. Propping up a failing model only delays the transition to more resilient, diversified, and farmer-centered agricultural systems.

If current trends continue—prioritizing short-term production over ecological limits—we risk accelerating soil loss, biodiversity collapse, and climate instability. The long-term consequence is a global food system increasingly vulnerable to failure. Allowing extractive industries to continue degrading land and water is not just environmentally reckless; it is a threat to future food security. Protecting our ecosystems today is inseparable from preventing hunger and catastrophe tomorrow.

Javier Garcia **Letter 844**

I agree to built this expansion because Riverview have really good core values and help our community in many ways like give job opportunity, buy locols supplies and help people from the towns also. In my opinion is gonna be help for everyone in many ways. Thanks.

Mike DeRosier, Interstates **Letter 845**

Dear Mr. Peterson,

My name is Mike DeRosier, Regional Manager of the Interstates Brainerd, MN. Interstates has had the opportunity to work with Riverview on electrical contractor services over the past several months, and I am writing in support of Riverview’s proposed West River Dairy expansion in Stevens County.

Through our experience, Riverview has been a professional and kind partner. They value their people and approach their work relationships with trust, respect, and good communication.

Projects like this can help support continued investment in rural Minnesota and contribute to the long-term strength of the agricultural economy. Responsible growth in production agriculture creates opportunities for local businesses, trades, and communities that depend on stable economic activity.

I respectfully encourage the Minnesota Pollution Control Agency to consider the value of this project and Riverview's role as a long-standing agricultural business in Minnesota.

Sincerely,

Mike DeRosier

Regional Manager

Interstates Brainerd

Levi Strahm **Letter 846**

The expansion of West River dairy would boost our local economy. It would provide more farmers in the area with the opertunity for manure.

Kevin Meixel **Letter 847**

We here at Meixel Farms, and Meixel Truck sales support the west river dairy expansion. They always have practical logistics planning, and clear milestones to help scale production smoothly. We enjoy doing business with them because of their commitment to quality, transparency, and collaboration—the kind of partnership that values open communication and mutual success. Their expansion creates many local jobs, from farming and harvesting to processing, packaging, and distribution, which strengthens the local economy and builds a more resilient community. By investing in local talent and infrastructure, they not only boost employment but also foster entrepreneurial spirit, support small businesses, and contribute to steady, inclusive growth that benefits families and neighborhoods alike.

It's important for those who oppose the dairy expansion to consider the broader implications of their stance. By resisting this growth, they may be overlooking the significant benefits it can bring to the local community and economy. The expansion is not just about increased production; it represents a vision for the future, one that fosters job creation and stimulates local businesses.

Without embracing such opportunities, there is a risk of stagnation, both economically and socially. It's essential to look beyond immediate concerns and recognize that progress often requires bold steps forward. Engaging with the expansion can provide a pathway to innovation, sustainability, and a thriving community that benefits everyone in the long run.

Ivan Regalado **Letter 848**

Riverview is a great company, I'm excited hearing this because I know will be many families benefits from this project, I have the opportunity to work with Riverview for more than 15 years, and this company has everything that a family needs to grow, full job (stable job) good benefits,Healt insurance,Dental insurance,HSA, 401K.

Joni Heins **Letter 849**

ATTN: Charles Peterson

Subject: Public Comment in Support of the West River Dairy Expansion

My name is Joni Heins, and I have lived in Stevens County for the past 15 years. I am writing in support of the proposed West River Dairy expansion.

Having grown up in the dairy industry, I understand firsthand the level of care, responsibility, and management required to run a quality operation. From what I have observed, the existing farm is clean, well maintained, and professionally managed. That is important to those of us who live nearby.

I also appreciate the positive role Riverview has played in our community over the years. Their support of programs like 4-H and FFA, along with providing scholarships, jobs, and learning opportunities for local students, has made a meaningful impact in rural areas like ours, including for my own children.

I understand the project is currently undergoing environmental review by the state, and I value that these processes are in place. In my experience, the existing review and permitting system is thorough and appropriate, and I believe it provides sufficient oversight for this project.

Beyond that, the dairy contributes to the local economy by supporting farmers, creating jobs, and partnering with local businesses - something that is vital to communities like ours.

For these reasons, I support the proposed expansion.

Sincerely,

Joni Heins

Nic McPhee **Letter 850**

To the Minnesota Pollution Control Agency,

I am writing to express my **serious concerns regarding the proposed West River Dairy expansion in Stevens County**. As this project would create a facility twice the size of any existing livestock operation in Minnesota, I strongly urge the MPCA to require a full Environmental Impact Statement (EIS) before proceeding with any permitting.

An operation of this magnitude—reaching over 26,000 animal units—is far outside the state's historical "envelope of experience." Proceeding with such an unprecedented expansion without the most rigorous level of review is a significant risk to our region.

My specific concerns include:

● **Scale and Precedent**: This facility would be nearly double the size of the next largest CAFO in Minnesota and 60 times the size of the average Minnesota dairy. This is a fundamentally new type of industrial operation that requires industrial-scale scrutiny.

● **Water Usage and Quality**: The proposal to pump 226 million gallons of water annually—nearly reaching the consumption levels of the entire City of Morris—poses a major threat to our local aquifers. Furthermore, the proximity to the Pomme de Terre River watershed and several protected wildlife areas makes the potential for pollution from the 250 million gallons of stored manure a critical concern.

● **Socio-Economic Impact**: Riverview already accounts for approximately one-third of the dairy cows in Minnesota. Allowing further consolidation at this scale is unhealthy for market competition and directly threatens the viability of small, family-run farms that are the backbone of our rural economy and culture.

Given the scale of this project and the potential for irreversible environmental and economic harm, a standard Environmental Assessment Worksheet (EAW) is insufficient. We must understand the full impact through an EIS before moving forward.

Thank you for your careful consideration of these comments.

Sincerely,

Nicholas Freitag McPhee

Kaleb Heins **Letter 851**

ATTN: Charles Peterson

Subject: Public Comment in Support of the West River Dairy Expansion

My name is Kaleb Heins, and I have lived in Stevens County for the past 15 years. I am writing in support of the proposed West River Dairy expansion.

Over the years, I have had the opportunity to engage with Riverview in several meaningful ways that have shaped both my personal and professional growth. Through completing an internship with Riverview, I gained valuable hands-on experience and a deeper understanding of the agricultural industry. Additionally, I was fortunate to receive a scholarship from Riverview that helped fund my college education - support that made a lasting difference for me and my family.

Riverview's impact extends beyond education and into youth development in our community. Through their dairy calf lease program, I was able to participate in the Stevens County 4-H dairy program, an experience that taught responsibility, work ethic, and leadership. Their involvement in helping build the new dairy barn on the Stevens County Fairgrounds has further strengthened opportunities for young people to learn and grow in agriculture.

From what I have observed, the existing dairy operation is clean, well-maintained, and professionally managed. These qualities matter to those of us who live and work in the area, and they reflect the standards Riverview upholds.

I also understand that the project is currently undergoing environmental review by the state. I value that these processes are in place, and I believe the current review and permitting system provides appropriate and thorough oversight.

Beyond its operations, the dairy plays an important role in supporting the local economy by creating jobs, partnering with local businesses, and contributing to the agricultural community. These benefits are vital to rural areas like Stevens County.

For these reasons, and based on my personal experience, I support the proposed expansion.

Sincerely,

Kaleb Heins

Vick Konkin **Letter 852**

its important to support the livestock industry in our state. Its vital for food security, providing essential nutrition to millions in our and neighboring states. these farms also provide the jobs needed for the rural communities and economies. i do not want EIS.

Todd Klein **Letter 853**

ATTN: Charles Peterson

My name is Todd Klein, and I am a farmer in Wilkin County, I am writing in support of the proposed West River Dairy Expansion.

Based on my experience and observations, Riverview Dairy operates with professionalism, integrity, and environmental responsibility. Their facilities are well-maintained, clean, and organized, and their teams are committed to doing things the right way.

As someone familiar with agriculture in this region, I reco□Jnize that manure management and water use are highly regulated in Minnesota. Riverview strives to follow these regulations, including nutrient management planning, soil testing, proper application rates, and timing based on field conditions. From what I have seen, their mindset is to meet and exceed these standards to ensure responsible stewardship.

The use of manure as a nutrient source has clear benefits for local farms, including improved soil health, increased organic matter and reduced erosion. This supports long-term agricultural sustainability.

Riverview has also been a strong community partner, supporting farmers, creating jobs, maintaining roads, and investing in schools and local programs. Their communication with neighbors and officials reflects their commitment to being a good neighbor.

I understand that this project is undergoing environmental review through the state's established process- one of the most rigorous in the region- and provides adequate oversight for this project. Based on the available data, existing regulations, and Riverview's proven track record, I am confident this project can continue to operate responsibly. I believe the current review process is sufficient and that additional regulatory burdens are unnecessary.

In closing, I respectfully encourage the appropriate agencies to approve the West River Dairy Expansion. This project supports local agriculture, strengthens rural communities, and reflects a responsible approach to environmental stewardship. I also believe that an EIS is not necessary.

Sincerely,

Todd Klein

Christopher Westerman **Letter 854**

We love our Riverview LLP neighbors! Not only do they bring a necessary economic driver to our small community (which as a small business owner helps support myself, employees, and family) but they are also great at keeping the countryside beautiful! They way they care for the land and keep their equipment/ facilities clean is rivaled by not many other farmers around. When they are working in fields close to our home we notice they take extra time to come back to clear mud from the roads and re grade them. Their ability to go above and beyond what is required to work and live in harmony with surrounding neighbors and communities is clear to see in the way they operate. Very thankful for their dedication to producing high quality dairy products right here in our backyard!

Chenoa Marks **Letter 855**

I am writing as a resident and student in Morris with concerns regarding the proposed Riverview West River Dairy expansion in Stevens County.

Given the scale of this project, I believe that a full Environmental Impact Statement must be conducted before any approval is considered. The potential long-term environmental impacts on groundwater, surface water, and the overall health of our local ecosystem, are too significant to be addressed through

a limited review process alone. There is much we don't know about our water systems, and they are already vulnerable as is.

In addition to environmental concerns, there are also broader implications for local agriculture. Expanding an operation of this size has the potential to change the local dairy market, placing increased pressure on small and mid-sized farms that are already facing economic challenges. The long-term sustainability of our local agricultural community should be prioritized, and not on economic gains.

As someone who lives, studies, and participates in this community, it is my hope that the decision makers take a precautionary and thorough approach to preserve our water systems and for the wellbeing of the community.

-Chenoa Marks

Anthony Vannelli **Letter 856**

I am writing in support of the West River Dairy expansion. They are on the modern edge of technology in their industry and provide well-paying skilled jobs. The idea that they are willing to re-invest into the state of Minnesota is a positive rather than the alternative of exiting, which would just be another negative impact on our local economies.

Regards

Gretchen Tuck **Letter 857**

We need to support our small family farms for so very may reasons!

In 1995, Minnesota had 9,000 dairy farms. By 2025, that number has fallen to 1,605. As farms have grown larger, many small family dairies have disappeared, and our rural communities feel that loss in real ways.

Riverview says this 18,500 cow facility would create 40 jobs. Yet the same number of cows could support around 70 conventional family farms (or 3,000 micro raw milk dairies like us!!!). Those are families who hire local help, support small businesses, build relationships, and keep small towns alive.

Please do Not allow this proposal to happen. It would devastate our small towns and all of us who live and work together. It would have a huge impact on the people the land the environment as a whole. Please we do not want this.

Liza Eng **Letter 858**

I am deeply concerned over the proposed expansion of West River Dairy operations. I respectfully ask that you preform an Environmental Impact Statement on this dairy expansion. The dairy expansion is massive and that alone should trigger an EIS. The location of this dairy operation needs to be studied. It is within a short distance from several important protected waterfowl areas.

Also, a river is also close to the expansion site. What will happen to those places if a leak from the ponds holding cattle waste would occur? Those stated areas will be ruined. There will be tremendous amounts of water used by this operation and all of our small town farmers will suffer from this huge dairy farm.

Carol Pietrick **Letter 859**

I cannot believe this expansion is even being considered! A feedlot of 18,855 cows is the population of a city. An 11,000-cow dairy is a city. How many small farmers will be put out of business because of this

expansion? The lives of these cows don't mean a thing. The cows are not widgets, they are sentient creatures. A feedlot is not a farm, it is a concentration camp. Do these cows pasture, see the light of day? I don't think so. I know a little something about cows as I grew up on a dairy farm in Morrison County. Please do not allow this expansion. For the sake of small dairy farmers, the environment & the cows themselves, please do not allow this expansion. I recommend you watch Cow, a 2021 British documentary film by Andrea Arnold, revolving around the life of a dairy cow. It's not pleasant.

Matt Sattler **Letter 860**

I support Riverview's West River Dairy expansion project. Additional comments and background in the attached letter. Thank you.

Dear Mr. Peterson

My name is Matt Sattler and I have been involved in the dairy business my entire life. Born and raised on a family dairy in eastern Wisconsin and have worked with dairy business owners my entire life. I am writing in support of Riverview and their proposed West River Dairy expansion in Stevens County.

I have worked with large dairy operations across the entire United States and across those experiences Riverview is the entity that I compare all those other dairies to. The Riverview organization is first class in all they do –

- Creating opportunities for jobs and personal development within the organization
- Environmental stewardship and maintaining clean, attractive tour-ready facilities
- Animal husbandry and their care for their cows
- Organizational culture and community involvement

From my experience working with Riverview, they are strong business partner that cares about where their expense dollars are spent and how that multiples across the local community. Riverview's presence and investments they have made have helped to maintain a vibrant agricultural economic engine and supports a broad base of business from agriculture, construction, and service related business that support the dairies.

The proposed expansion at West River represents a meaningful economic benefit to the area. It will help to maintain the financial viability of the dairy and the direct/indirect local jobs that the dairy supports.

To maintain a sustainable and competitive rural economy and communities across western Minnesota, we need projects like this and companies like Riverview that are willing to make those investments.

Riverview has an exceptionally strong track record with regards to environmental stewardship and protecting the natural resources we all value in Minnesota. The existing state environmental review process through MPCA is rigorous and sufficient and with that in mind, I believe an EIS is not necessary. I respectfully encourage your support and approval of this important project.

Sincerely,

Matt Sattler

Kurt Grimm, NutraDrip **Letter 861**

Riverview continues to be a champion of workplace safety, environmental stewardship, efficiency and an economic development workhorse. Our company offers solutions that allow dairies to apply manure in a way that is more environmentally friendly. Many dairies cannot or will not invest in this technology.

Riverview on the other hand is leading the way in using and implementing this system. Their attention to detail at every level is unprecedented. We work with diaries from CA to NY and I always know when I step on a Riverview site it will be clean, well maintained, and operated at the highest level of professionalism. I can personally attest to their commitment to operate dairies in way that will benefit their neighbors, community and state. And their manure management application is always done in a way that responsibly stewards the environment. I give my support to Riverview expanding their site at West River. And I would welcome the opportunity to share my personal experience with Riverview and how they handle manure and water.

Dennis Cuchna **Letter 862**

I am completely opposed to this expansion.

The actual and potential hazards are massive.

The increased traffic and manure handling are mind boggling.

Thank you

Emily Bruce **Letter 863**

I'm deeply concerned about the unprecedented scale of this proposal, as well as the company's track record with damaging water resources in the southwestern US. This project must be required to undergo a full Environmental Impact Statement (EIS). Please take the potential implications seriously for the sake of all our community's health and wellbeing.

Bonnie Nelson **Letter 864**

I am totally against this expansion.

Cows are not 'units'. They are living creatures that feel pain and mental stress. Confining cows the way Riverview does is not only immoral, but also a very sad reflection on how our species disregards basic compassion towards other living creatures that we share this planet with.

It is impossible to operate a CAFO like this and not be environmentally destructive which is what your agency is supposed to prevent.

Sonja Trom Eayrs **Letter 865**

According to Farm Action, dairy farms have grown increasingly consolidated with a small percentage of large operations producing the majority of the milk supply.

2.5% of dairies (the 834 dairy operations with more than 2,500 cows) produce nearly 45% of American raw milk annually.

Dairy Farmers of America (DFA) aggregates and markets around 30% of the country's raw milk from over 14,000 dairies.

The eight largest milk cooperatives together account for more than 54% of annual milk production.

Domestic Milk Processors CR4: 39-41%
DFA: 15%
Land O'Lakes: 10-12%
Saputo Inc.: 7%
Nestle: 7%

Fluid Milk Sales CR3: 83%
DFA: 39.1%
Land O'Lakes: 35.2%
California Dairies: 8.8%

Further concentration in the dairy industry threatens smaller dairy operations. Further placing control of our food and dairy supply in the hands of a few corporate operators threatens our food supply and our national security.

Sonja Trom Eayrs

Holly Windle **Letter 866**

No, this is just too big a dairy for a responsible operation. This is a profit-driven proposal for concentration of cows that would make it unlikely that considerations about manure run-off or healthy animals would be part of the operation. Well-managed dairies know the value of animals fed on grass, not grain. and they know how to incorporate the potentially-valuable manure into land-enriching compost. This expansion does not seem to fit that possibility.

Minnesota should be encouraging farmers who want to provide a healthy product to us consumers by way of responsible land stewardship and animal management--not jsut looking to make more money by increasing their economy-of-scale.

Dana Jackson **Letter 867**

The Riverview dairy cattle expansion should not even be considered unless the business prepares a full environmental impact statement. This is not just a dairy expansion proposed, it is a huge animal factory expansion with a potential for disastrous impacts on groundwater for a large geographic area. The environmental impacts could be widespread in the soil and the air, as well as the surface and the groundwater. We have evidence of environmental damage done by largescale livestock facilities all over the nation, so why would we want to risk Minnesota's natural resources by allowing this gigantic animal factory. The Minnesota Pollution Control Agency should stop this now instead of working to control the pollution it will undoubtedly cause down the road.

Barbara Hyk-Zimmer **Letter 868**

I have been a STRONG opponent to factory farms. They are BAD for the environment, BAD for the cows (if unhealthy for cows... unhealthy for humans) As a society we are very unhealthy and THIS is one of the causes. Another is GMO's, as well as chemicals in farming instead of organic/sustainable farming practices. I'm a kidney cancer survivor caused by TCE in my drinking water. My only child died at 9 mo 26 days old is saving our place at Ft Snelling National Cemetery because of it. I get sick if I don't focus on organic foods or at least non GMO. In the past we have grown our own veggies and we only did organic farming.

DO NOT APPROVE OF THIS HORRIBLE PROJECT!!!

Mary Polta **Letter 869**

I am so opposed to the West River Dairy Expansion. What an eyesore and a problem of smells, water use, inhumane animal care and environmental pollution. Minnesota is a better state than polluting land.

Roslyn Hjermstad **Letter 870**

Thank you for taking comments about the proposed Riverview Dairy expansion project. The gigantic scale of the proposal rings alarm bells for me, so I am vehemently opposed. As a good first step, there must be a full and rigorous Environmental Impact investigation and report. That EIS should assess the effects of thousands of dairy cows on the environment, both locally and regionally. There are also economic impacts, because this is a corporate entity that will control markets and squeeze out smaller family operations with its sheer size. To approve of the Riverview Dairy project without a thorough evaluation of all consequences is not recommended. I am not a close neighbor of the site, but if approved it would set a precedent for similar factory farms in my area, the SE Minnesota karst geology (driftless) region. PLEASE deny any new permits for Riverview Dairy.

Leona Hanson **Letter 871**

Huge animal confinement of any kind has gotten way out of control. It's unhealthy for the animals, the enviroment and humans. The stench in the air most days is unbearable if you live within a short distance of these farms or buildings. It's disgusting and should have never been allowed in the 1st place. We also need to get rid of all farmers on country boards. I've found from experience that they don't care about the enviroment period. They don't even follow their own rules. It's all about money. As long as they don't have to put up with the smell or the destruction of the enviroment next to them they give the permit to the mega farmer. I'm sick of it.

Kay Drache **Letter 872**

I grew up on what was then considered a large beef operation of around 1000 head of cattle. The very idea of a confined operation of the size proposed by Riverview is appalling. Please do not let this expansion go forward.

Thank you for your attention and consideration of all the implications of this dairy proposal for people and the environment.

Pat Peschman **Letter 873**

I am writing to encourage you to deny the permit for the West River Dairy Expansion, a proposed massive operation. The environmental impacts of CAFO's is well known and cannot be denied. Negative impacts to water quality, increased greenhouse gas emissions, increased antibiotic resistance, and nutrient pollution to land from the massive waste are not what the community or the state of Mn need. I urge you to deny this permit.

George Pliml **Letter 874**

The United States continues to experience business consolidation within the agriculture sector. An example is that only four companies control 100% of the beef processing industry. This does not help the family farm at all, in fact it puts additional strain upon the farms existence. We cannot let further consolidation happen within our states dairy industry. Our county, the largest in Minnesota, now has only two or three dairy operations. These small family operations contribute so much to our local economies. So to allow an expansion of the West River facility is another nail in the coffin in our states and local small family dairy operations. I say no to the permit!

Sandra Sheets **Letter 875**

I live in Stevens county. I grew up here and live in the farm my grandfather grew up on in this county. Our farm is near an existing riverside operation just across the border into Traverse County and we have

learned that Riverview is also trying to expand another operation by our farm in addition to this one. I am concerned about how this operation will impact our water in this community, both quality and quantity. We have already had to start testing our water on our farm because the well that I drank from as a kid is now contaminated. The information presented in this EAW does not reassure me that Riverview will do what it needs to do to protect our water in Stevens county. The information provided in the EAW about water, even after the aquifer test that was initially left out was adde, is outdated and insufficient. An EIS must be required. It is the only way to get the information that my self and my community need to feel this project can go forward safely.

Kathy Herron **Letter 876**

Factory farms are a danger to our farmland, our animals, and our people. The concentration of animals and their waste is not manageable in the magnitude proposed. Please stop this.

Susan Scherer **Letter 877**

Having lived in rural areas for much of my life, small businesses, whether they are agricultural, recreational, or anything that offers a comfortable livelihood, a safe place to live and raise a family, is an essential choice for any person. Increasing the size of farms/dairies is a distressing indication that the values of rural individuals are being dismissed, in favor of corporations that make profit the sole reason for existing. What that consolidation means is that communities lose their residents who are no longer able to make a living.

Small, rural communities have been a safe, affordable choice for people who want to know their neighbors, to be there to help when needed, to enjoy each other's presence, and to raise children in an environment that values the land they thrive on, rather than the need to be bigger and richer. Allowing a massive dairy to become even bigger is a move that nullifies those values, and it contributes to the destruction of the very land we treasure.

Elizabeth Reach **Letter 878**

i am disgusted. too many cows. not enough work for workers, family farmers. again, disgusted. The environmental impact of this would be devastating. this is the largest cafo i have ever heard of. inhumane. makes me want to give up all hope. do not bow down to this corporation. deny their giant cafo please for the love of nature.

Devin Hammer **Letter 879**

My name is Devin, and I have worked for Summerville Electric for 16 years and have collaborated with Riverview on three previous new projects, in addition to providing ongoing service work at their sites. From what I have observed, the existing facility is clean and well maintained. Operations appear organized and professionally managed. That matters to those of who live nearby. I understand the project is undergoing environmental review by the state. I appreciate that these projects are subject to oversight and permitting before moving forward. In my experience, Riverview has operated responsibly in the community.

Furthermore, the dairy provides significant support to local farmers, employment, and businesses. These partnerships are vital to the economic health of our rural area.

For these reasons, I support the expansion.

Sincerely,

Devin

Shane Reynolds **Letter 880**

I am writing in support of Riverview's dairy expansion at West River Dairy and to oppose the imposition of an Environmental Impact Statement (EIS) in this case.

The existing Environmental Assessment Worksheet process, combined with the Minnesota DNR's separate aquifer review, represents a thorough and appropriate level of environmental scrutiny for a dairy operation of this kind. The current process is extensive, well-established, and sufficient. Requiring an EIS would set a damaging regulatory precedent for dairy agriculture across Minnesota and the Upper Midwest.

Beyond the regulatory question, it's worth acknowledging what an operation like Riverview's expansion means for the surrounding community. Dairy farms of this scale are economic anchors for rural Minnesota — they create direct jobs on the farm and ripple through dozens of supporting businesses, from equipment and feed suppliers to veterinary services and local contractors. Critically, they create a reliable, local demand source for the crops that Minnesota's grain farmers produce, strengthening the agricultural economy as a whole. Opposing this expansion doesn't just affect Riverview — it affects an entire ecosystem of rural livelihoods that depend on a thriving dairy industry.

I have extensive professional experience working with large dairy operations across the country, and Riverview ranks among the highest-standards operators I have encountered. Their commitment to infrastructure quality, animal welfare, and responsible land and water stewardship gives me real confidence that this expansion will be executed with the care the community deserves.

The current review process is sufficient. I urge the MPCA to approve this project without an EIS requirement.

Shane Reynolds

Kelly Fredrickson **Letter 881**

I vehemently oppose this expansion. It will be an environmental hazard that poisons our communities. I cannot articulate how much damage this will do!

Jim VanderGiessen, PRO Refrigeration, Inc. **Letter 882**

ATTN: Charles Peterson

My name is Jim VanderGiessen, and I am the CEO of PRO Refrigeration, Inc., a family-owned refrigeration equipment manufacturer serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad

network of agricultural and service-related businesses. Riverview is genuinely focused on the future - they have taken some of the biggest steps in their industry toward efficient and environmentally responsible cooling solutions, helping demonstrate to the broader dairy sector what smart, forward looking investment looks like. We will work directly with multiple local and regional supply and service companies to maintain and support the systems we are providing them.

We are confident that Minnesota's environmental review process is thorough and well-equipped to evaluate projects like this one, and we fully support that process moving forward. Projects of this scale are essential to maintaining a competitive and sustainable rural economy, and continued investment in agriculture ensures that local businesses can provide jobs, services, and economic stability close to home.

I respectfully encourage your support and approval of this important project.

Sincerely,

Jim VanderGiessen, CEO

PRO Refrigeration, Inc.

Kim and Deborah K. Larson **Letter 883**

ATTN: Charles Peterson

We find it disheartening that unjustified negative labeling in agriculture continues to be an applied tactic in the ongoing small vs big agricultural operations. Many of the comments written in opposition to this project are typical examples of trying to proclaim this farmer and employee owned dairy (no East/West Coast investments or Hedge funds whatsoever) as a *"factory farm"*. Furthermore, just because this dairy is larger than most, many want to automatically label it …. bad - in all categories.

Statistics indicate the current average dairy herd farm in Minnesota is inventoried at 275 milking cows. When our grandparents milked their typical 16 dairy cows in the 1940's, alarmist of the day may have perceived dairy farms of 270+ cows with the following conjecturing *"…. just seems unreasonably too large"*, and "…. couldn't possibly be safe for the environment", and "…. would most certainly cross the line for animal welfare", and "…. we just don't need any more cows", and finally "…. A dairy farm of 270+ cows can only be defined as a … factory farm." All of these misconceptions about dairy herd size, whether 65 yrs ago or today, couldn't be further from the truth.

What is true, is that Minnesota's dairy farmers of today have more on the line than most, in making sure the environment around their farm is secure and protected, and the welfare of their cows is as humane and ethical as possible. Farmers and their families live in the immediate area of their farms. Nothing is more paramount to any farmer than a safe, abundant supply of water, as their families drink the water from the aquifers right beneath the land they farm. Equally, the welfare of their livestock is of principal importance to the security of their business. They know from experience that the best care they can provide to their livestock has proven to provide the best return to their family's livelihood.

What is also true, is that everything constantly evolves. No more so than in all areas of production agriculture. *"Economies of scale"* is the term used to describe the most efficient size a business needs to reach for maximum competitiveness, in what-ever segment they're competing in. It is most definitely played out in the following examples. The average MN farm acres in crop production in 1940 was 160 acres. The MN average today is 400+ and expected to double by 2040. Likewise, the increase in the average dairy herd size by 2040 will most definitely be bigger than the average of today, because

nothing can be expected to stay constant. But, it would be unjustifiable to formulate a knee-jerk reaction that …. bigger is automatically bad.

There is no disputing the fact that questions rightfully can, and should be asked, in the focus of science. The current EAW review would be absolutely thorough enough to answer all realistic questions enough to support the project. The level of inquiries needed to initiate an EIS would rise to the review level required for a Boundary Waters copper mine or a mid-Minnesota nuclear power plant …. not a livestock farm producing milk.

Respectfully,

Kim and Deborah K. Larson

Beth Stanford **Letter 884**

To whom it may concern: this expansion concerns every person in our state. Please do not approve this extensive expansion. When is large enough enough? If approved this time, others will push for theirs. We're fighting data centers which are destructors of the environment. Agrobusiness is too much for the environment to handle.

Mike Quale **Letter 885**

My name is Mike Quale; I want to express my support for their operation and their proposed expansion in Stevens County.

Riverview runs a top tier operation. Their facilities are clean, they care for the land, they support local communities, and they provide excellent care for their livestock. From what I have observed, they follow a long list of rules and regulations and consistently demonstrate that they are committed to doing things the right way.

Operations like Riverview bring significant value to the local agricultural community. For example:

1. They provide manure for fertilizer, reducing dependence on foreign produced fertilizers that are often controlled by a small number of global suppliers.

2. They give local farmers an additional market for their crops, increasing demand and strengthening local basis levels. This adds value to all producers in the area, regardless of their stance on this specific project.

Projects like this contribute meaningfully to rural America by supporting agricultural sustainability, economic opportunity, and community vitality. Based on my experience as a nearby resident, I fully support Riverview Dairy's expansion project in Stevens County.

Sincerely,

Mike Quale

Brady Koehl **Letter 886**

To Whom it My Concern,

First off, I wanted to introduce myself. My name is Brady Koehl, & I have now lived in Stevens County for 32 years & counting (with a brief hiatus to attend college in Marshall, MN). I am a resident of Hancock, MN – I am a father, husband, farmer, accountant, city council member, & community volunteer. This

isn't really my cup of tea to make a public comment, but the more I thought about it, the more I thought there were some things I needed to say on this matter.

I do want to start off by saying, I understand & acknowledge the environmental concerns. As farmers in greater MN, this is something that we are conscious of every day. As everything scales, & the size of the equipment, livestock herds, & everything in between grows larger – this can seem very intimidating & can be perceived in a negative way by many. I am here to tell you we are hyper aware of this. However, I take comfort in knowing that an operation like Riverview has already done more than their share of due diligence on a project of this nature, including the necessary research in the background, permitting, etc. to make sure that this is done in the correct way. This type of operation already operates under strict regulatory oversight, & the systems are in place to meet MPCA requirements.

Further, I wanted to dig a little bit into some of the specific concerns. I have heard comments about the size of the dairy, & the emissions from the animals., etc. Keep in mind – this dairy will be large, but half of the dairy is already in existence! Yes, the dairy that will be operating after the expansion will be the largest in MN. But it is not all new construction – half is already operating smoothly today. On top of this, I would encourage you to explore some of the positive things that Riverview is already doing to offset many of these concerns. From ensuring the operation is energy efficient as possible – this is something that is done in the name of cost – to capturing the methane gas & re-purposing this in an environmentally friendly way, the operation is only helped by reducing these things.

I have also heard concerns with the manure that will be a biproduct of this increased herd. As a farmer that has used this bi-product, the misconceptions of this being a negative for the land & water are often mis-cast. Regardless of the form, farmers need fertilizer as part of their crop plan. The larger percentage that comes from organic matter sources, the more positive of an impact there is the potential for on the land. Also – as a farmer that is in the business of organic production, this manure becomes a necessity & helps drive the growth in that area of our business.

Finally, the water. This is a concern, & I know this is something that has been seen around the nation. However, in a highly rural area like Stevens County, the water issues that are often tied to overuse or strain on local water systems in more densely populated or drought-prone areas have not come to light. As we become more efficient with our water use, more intentional with our practices, & are conscious of the numerous issues with water around the nation, & around the world – this is being considered, measured, studied, & remedied wherever possible. On top of this – Riverview has a plan in place to re-use much of the water that is in the end-product that is a key cog of this expansion plan. I would encourage you to ask their representatives about this, as it is a very cool concept.

Finally, to anyone reading this that is not familiar with Stevens County, I would encourage you to come & pay us a visit. This area is special & is uniquely positioned to pursue this kind of opportunity. We tend to join as one in support of projects of this nature, & we recognize the many benefits that Riverview has brought to our community, our families, & to the many individuals that are involved with the economics of the area. On top of that, on the drive west past the existing west-river dairy, I am reminded of the beauty of the countryside that we are lucky enough to live in.

When you drive past, yes, you will note the operation. But I would encourage you to reach out & ask for a tour & explore more before you develop an opinion. If you would like to talk about this – feel free to reach out to me – I am happy to discuss both sides of the arguments for & against this expansion. I am always open to more information.

Sincerely,

Brady Koehl

Anonymous **Letter 887**

I am a citizen of the state for 40 years and I wish to register my opposition to the RiverviewLLC cowfarm proposal. This proposed increase would have a severe effect upon the state, causing for example overloading of manure in water and alga blooms, risks to humans from possible health issues, greenhouse gas issues, etc. Please vote AGAINST this proposal when it comes up. THANK YOU!!!

Michael Crinion **Letter 888**

To Whom It May Concern:

I am writing to you as a dairy farmer in Minnesota. I want to express my personal support for the expansion of Riverview's West River Dairy in Stevens County.

I have watched the dairy industry evolve dramatically over the years. The farms we operate today bear little resemblance to those of a generation ago — not just in size, but in how carefully and thoughtfully we manage land, water, and nutrients. The tools available to us now, from precision nutrient management to advanced manure handling to real-time environmental monitoring, have made it possible to grow dairy production while improving our environmental outcomes. Riverview is a leader in putting those tools to work.

I have personally visited Riverview's farms and have seen firsthand how they manage their farms with a high level of professionalism and care for their employees, their animals and the environment. They set the standard for others in how to run dairy farms with consistent, responsible and ethical standards.

Riverview also brings jobs and opportunities to their communities. They partner with neighboring farmers on manure application programs that reduce the need for synthetic fertilizers and improve soil health across thousands of acres. They support local businesses. They show up.

Riverview has also earned its reputation for environmental stewardship. Their investments in water conservation — including water-recapture basins that reduce dependence on a single water source — and their proactive approach to manure management are evidence of a company that takes its responsibilities seriously. This is not compliance for its own sake; it reflects genuine values.

As an Edge board member, I want to be clear that Edge Dairy Farmer Cooperative has full confidence in Minnesota's existing environmental review process. The MPCA is experienced and well-equipped to evaluate this expansion and to use the tools at its disposal — including individual permit conditions where warranted — to protect our state's waters. We do not believe an Environmental Impact Statement or additional review layers are necessary or appropriate here.

I have heard concerns raised about the economic impact of this expansion on other dairy farms. I understand those concerns — competition is real and farming is hard. But the environmental permitting process is not the right place to resolve questions about dairy industry structure or farm size. Those are conversations for the legislature. Using environmental review to block or delay a project that has met the applicable standards would set a troubling precedent and undermine a process that all of us in agriculture depend on.

Riverview has done the work. They have earned this permit. I encourage the MPCA to proceed based on the science, trust the process, and support the kind of responsible dairy growth that keeps Minnesota competitive and keeps farm families on the land.

Sincerely,

Michael Crinion

Ash Grove Dairy

Mary Steinbicker **Letter 889**

The Riverview Dairy expansion requires, at a minimum, an environmental review. Coming from a farm community, I cannot conceive of what it will take to safely remove manure for that many animals. And the cruelty of confinement is inhumane.

Micky McGilligan **Letter 890**

In Minnesota and across the country, increasing attention is being drawn to the animal agriculture industry and the anti-competitive practices that are being used to benefit a small minority of parties along the food supply chain. From lower milk check amounts and issues related to accessing processing at a fair price, to higher prices at the grocery store, everyone — farmers, the communities they are a part of, and eaters — is being negatively affected by this.

Tom Beer **Letter 891**

The fact that we don't know the likely impacts of the West River Dairy expansion on air quality, soil pollution and water quality begs the necessity of a full, objective and timely environmental analysis. I urge the MPCA to allow this. Thank you, Tom Beer

Donna Wermus **Letter 892**

Riverview has a recent history of manure spills in western Minnesota. In Arizona, the company recently agreed to pay $11 million to residents affected by the over pumping of the dairy operation. The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

Amy Nankivil **Letter 893**

The Riverview CAFO Proposal Needs an EIS prior to building the first livestock operation in the state to hold over 20,000 animal units.

This operation, which is proposed for Stevens County, would be nearly double the size of the next largest livestock operation in the state in terms of animal units. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers, the water, and rural communities.

The Minnesota Pollution Control Agency (MPCA), the agency that issues feedlot permits, must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it has to previous proposals. In short, this proposal must be required to undergo a full environmental impact statement process.

Martha Krikava **Letter 894**

Riverview, based out of Morris, Minn., is one of the largest milk producers in the country. The firm now owns 16 permitted dairy CAFOs in Minnesota alone, and these facilities house a total of more than 135,000 cows, according to the Star Tribune. That accounts for nearly a third of the state's entire dairy herd. Riverview also has a major presence in North Dakota, South Dakota, Nebraska, New Mexico, and Arizona.

An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit.

According to the documents filed by Riverview, the proposed operation would:

Be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year.

Have liquid manure storage encompassing 250 million gallons of waste. Require 13,200 acres of farmland for manure application.

This project must not go forward without an Environmental Impact Statement and review. Riverview has a recent history of manure spills in western Minnesota. In Arizona, the company recently agreed to pay $11 million to residents affected by the dairy's overpumping. The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

Just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

In Minnesota and across the country, increasing attention is being drawn to the animal agriculture industry and the anti-competitive practices that are being used to benefit a small minority of parties along the food supply chain. From lower milk check amounts and issues related to accessing processing at a fair price, to higher prices at the grocery store, everyone — farmers, the communities they are a part of, and eaters — is being negatively affected by this.

Thank you for your consideration of my concern and request.

Susan Darley-Hill **Letter 895**

This project begs extreme scrutiny for the potential of many and varied negative impacts it will most certainly have on traditional, smaller scale farming operations, on appropriate land use, on water supply (sucking up a staggering volume) and pollution from soil runoff and massively excessive manure handling and spreading/disposal of giant amounts of waste. This is not the kind of industrial farming that benefits anyone other than the corporation that reaps profits at the expense of everyone who seeks a safe water supply, healthy soil, an environment undiminished by overuse, pollution, and a safe food supply. Allowing this kind of operation exhibits an utter disregard for families seeking a fair shake in the agricultural economy.

Martha Archer **Letter 896**

This proposal by Riverview must be required to undergo a full environmental impact statement (EIS). This expanded Riverview facility would be more than 60 times the size of the average Minnesota dairy. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities. The health of our ag land and wellness of our communities is at risk with this expansion.

This project must go thru industrial scale review to ensure compliance, transparency and communication.

Katharine Winston **Letter 897**

This is a HUGE undertaking - DON'T MESS IT UP! Protect your citizens, communities, and rural lands: In Minnesota and across the country, increasing attention is being drawn to the animal agriculture industry and the anti-competitive practices that are being used to benefit a small minority of parties along the food supply chain. From lower milk check amounts and issues related to accessing processing at a fair price, to higher prices at the grocery store, everyone — farmers, the communities they are a part of, and eaters — is being negatively affected by this.

Amy Cordry **Letter 898**

If built, the facility will hold 18,855 dairy cattle, bringing the total animal units to 26,397 in one place. This proposed expansion would be nearly double the size of the next largest livestock operation in our state in terms of animal units. This expanded Riverview facility would be more than 60 times the size of the average Minnesota dairy, which had fewer than 280 cows in 2025. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Riverview, based out of Morris, Minn., is one of the largest milk producers in the country. The firm now owns 16 permitted dairy CAFOs in Minnesota alone, and these facilities house a total of more than 135,000 cows, according to the Star Tribune. That accounts for nearly a third of the state's entire dairy herd. Riverview also has a major presence in North Dakota, South Dakota, Nebraska, New Mexico, and Arizona.

The Minnesota Pollution Control Agency (MPCA), which is the agency that issues Minnesota's feedlot permits, must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview must be required to undergo a full environmental impact statement (EIS).

Mark Muller **Letter 899**

Large CAFOs are an affront to family farmers and our soil and water. Riverview represents the wrong direction for Minnesota agriculture. Please require the CAFO to go through a full environmental impact process.

Chloe Stotler **Letter 900**

This expansion is enormous and needs to be reviewed in depth before proceeding. The proposal should undergo a full Environmental Impact Statement (EIS).

Dorothy Dolezal **Letter 901**

I strongly disapprove the use of CAFO facilities, as they are cruel to the animals and harmful to our environment. There is nothing that could convince me that this is an appropriate way to farm.

William Gorman, Pro Refrigeration **Letter 902**

Dear Mr. Peterson,

My name is William Gorman, and I serve as Vice President of Sales for Pro Refrigeration, supporting dairy operations across the United States, including partners like Riverview.

I am writing to express our strong support for Riverview's proposed West River Dairy expansion in Stevens County.

Through our work in the dairy industry, we see firsthand the importance of stable, wellmanaged livestock operations. Businesses like Riverview play a critical role in sustaining rural economies by creating jobs, driving local investment, and supporting a broad network of suppliers and service providers.

I have personally visited Riverview's farms and have seen firsthand how they operate with a high level of professionalism and care for their employees, their animals, and the environment. They set the standard for how modern dairy farms should be run—with consistent, responsible, and ethical practices.

This proposed expansion represents a meaningful economic opportunity for the region. It will increase demand for local vendors, support both construction and long-term employment, and strengthen the surrounding agricultural community.

From our experience, Riverview is a dependable and well-run organization whose continued growth benefits not only their business, but also companies like ours and many others that rely on a strong dairy industry.

Based on our understanding of the state's environmental review process, it is both rigorous and appropriate. We do not believe an Environmental Impact Statement (EIS) is necessary in this case.

I respectfully encourage your support and approval of this important project.

Sincerely,

William Gorman

Vice President of Sales

Pro Refrigeration

Sarah Johnson **Letter 903**

I strongly encourage the MPCA to conduct a very thorough environmental review for this gigantic operation. I think we need to be more supportive of smaller, family farms frankly. But at least please don't rubber stamp this factory farm. Thank you!!

Jason Henrich, Flat Rate Inc. **Letter 904**

ATTN: Charles Peterson

My name is Jason Henrich, and I am the General Manager of Flat Rate Inc., a company specializing in concrete placement and aggregate hauling throughout Minnesota and the Dakotas, servicing agricultural operations like Riverview LLP.

I am writing to offer my support for Riverview's proposed West River Dairy expansion in Stevens County. Based on our firsthand experience of working on projects with Riverview over the last fifteen years, we can confidently say that Riverview operates with professionalism and reliability. Their projects contribute positively to the areas in which they are located, strengthening the broader network of agricultural producers and service providers.

Agricultural operations like Riverview's play a key role in sustaining the economic health of rural communities that depend heavily on agriculture. They drive economic activity by creating jobs, encouraging local investment, and supporting local businesses like ours. Supporting growth in this sector

helps ensure that local businesses can continue to operate, expand, and provide valuable employment opportunities within their communities.

Based on our longstanding relationship and firsthand experience, we are confident in Riverview's ability to meet all applicable environmental regulations and operate responsibly within the community. I respectfully encourage you to approve and support the West River Dairy expansion.

Thank you,

Jason Henrich

General Manager

Flat Rate, Inc.

Jeanne Landkamer **Letter 905**

Dear MPCA,

I am very concerned about the expansion of CAFOs in Minnesota. They pollute area waters and make large areas unlivable because of the toxic air quality. They put small producers out of business. They have a record of intimidating and harassing farmers that object to these gigantic operations. For a variety of reasons, I think it is imperative that the MPCA require a full environmental impact statement to assess the dangers posed by the proposal to expand the West River Dairy operations.

Thank you,

Jeanne Landkamer

Allison Greenwald **Letter 906**

Hello,

I have many concerns about this expansion and believe that a full environmental impact report is absolutely necessary.

This expansion would keep cows in total confinement which raises serious animal rights concerns. In addition, increasing livestock production of this scale with generate massive amounts of manure, increasing the risk of water pollution and toxic algae blooms. It will put a strain on already taxed water resources using up to 100-226 million gallons annually. The Minnesota Pollution Control Agency estimates that 56 percent of surface waters do not meet basic water quality standards, and that crop and livestock production contribute to 85 percent of the state's water pollution.

Please do not move forward with this project.

Thank you,

Allison Greenwald

Jessica Renner **Letter 907**

Yes, we need a full environmental impact statement!!

Gwendolyn Fassett **Letter 908**

This CAFO proposal needs an environmental review, a SERIOUS environmental review! Almost twice the number of cows as the current largest operation in the state? As much water as the city of Morris? I

don't know why we're even considering this proposal -- CAFOs are terrible for the animals, terrible for the neighbors, terrible for small farmers, and terrible for the environment. At the very least, this proposal should not move forward without a strict environmental review and regular, thorough inspections to ensure that their 250 million gallon waste storage (!!!) is not leaking. Actually, don't bother with the review -- just do the right thing and deny this proposal!

Thank you.

Tiffany Nesbit **Letter 909**

Please do not expand and please complete a full environmental review.

Ah-li Monahan **Letter 910**

I am very concerned about the proposed dairy in the area near Morris, Minnesota. It is more than double the animal units of the next largest dairy operation in Minnesota. As such, it risks more harm to the area than our current CAFOs. It would be located near several sensitive wildlife areas where manure could do a lot of harm. The company already has a track record of harmful spills in other states. The company is also asking for a permit to use almost as much water as the nearby city.

With such a large operation, Riverview, LLP must be required to submit a full EIS, and the EPA needs to do an in-depth examination before deciding on whether to issue a permit.

Thank you for your consideration.

Laura Cullip **Letter 911**

To Minnesota Pollution Control Agency,

I am writing as a concerned citizen, landowner, and farmer in MN regarding the West River Dairy Expansion. My concerns are environmental, economic, and to the overall health of the MN community. Nationally and in MN, we are in an economic farm crisis with small farms struggling to pay their bills and continue their farming livelihood due to low market prices and high costs of inputs, rental price of land, and difficulty competing against a few larger and larger farm operations. An expansion of this size is not of an economic benefit to MN. It continues a trend of inequality in agriculture with just a few farmers monopolizing the market and animals, while the smaller farms are often kept out of markets, milk trucks won't come to their farm, they can't compete on land rental prices, milk prices plummet, and ultimately smaller farmers can't compete and stay in business. Our land, economy, and communities suffer when family farms go out of business and business is consolidated into a few.

Environmentally, this is altogether too many animals, too much water usage, and too much manure consolidated into one location. It is an outrageous and egregious example of consolidation. This site is within 5 miles of 8 different protected waterfowl and wildlife protection areas. There needs to be a full environmental review in the form of an EIS so that local residents have the opportunity to weigh in on the impacts this project may have on them, their farms, their community, the wildlife, and landscape. If there are no environmental, community or economic issues with having 26,397 animal units in one location, then let the EIS process illustrate that and give citizens an opportunity to weigh in for further review. We need full transparency and accountability in this permitting process. Otherwise it looks like the largest dairy operation in MN gets to leverage their market monopoly, influence, and power to favor their individual business over what is best for the community, environment, and local farming community.

Thank you for considering my comments.

Sincerely,

Laura Cullip

Darlys Vogt **Letter 912**

The SIZE of the Riverview expansion project is OUTRAGIOUS and NOT WANTed in STEVENS COUNTY.

Being a proud area farm resident for most of my 80 years, as well as the generations before me. I VALUE our MANY LAKES and the outcome of the grain and smaller farms we have in the area now and into future.

Also have a HUGE concern for the ODOR, WATER, HEAL TH ISSUES and what about the aquifer in the future.

We need everyone to make up a community, not just the BIG Companies.

Regardless of the outcome of the reports. My answer is NO! NO! NO! To the LARGE EXPANSION.

Respectfully,

Darlys Vogt

PS thanks for your time

Nicole Wenzel **Letter 913**

Hello MPCA,

The MPCA must recognize the fundamentally new nature of the Riverview Dairy Expansion threat to our land and water resources and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview, LLP must be required to undergo a full Environmental Impact Statement (EIS).Riverview has a recent history of manure spills in western Minnesota. In Arizona, the company also recently agreed to pay $11 million to residents affected by the dairy's overpumping. There are 8 different protected waterfowl and wildlife production areas within 5 miles of the new location, and is located as part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices - an EIS would help address the socio-economic impacts of this project. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating local economies in the process.

PLEASE conduct a full EIS - thank you for your time and consideration. We are so lucky to have the natural resources we have in MN and the greater Midwest and need to do all we can to take care of it.

Scott Wirtzfeld **Letter 914**

Dear MPCA,

My name is Scott and have just began working with Riverview on a project unrelated to the expansion of the dairy in question. Up to this point this company has been a class act to work with. They do not cut corners and are constantly trying to help better their employees. They offer a huge economic benefit to

the communities that they are present in. They preach cleanliness and you can certainly see it at the sites they have. I would like to give my support to Riverview LLP, thank you for your time.

Jessie Pinney **Letter 915**

The impact of the amount of water for the 18,000 dairy operation is a major impact. Also, the fact that the manure is spread over such a large area is another reason for environmental impact study. I know this is just looking at the environment, but I would like to know how many farmworkers will be employed and also what they will be paid. Do they have other benefits like health care, vacation, overtime pay, etc. and my last comment is that we are already subsidizing milk because we have a glut of it do we really need more dairy? And if we do, where is the product going, what market will it be in, and how does it affect the existing market now?

Michelle Carroll **Letter 916**

Minnesota's approach to managing water resources is lax, to the detriment of taxpaying citizens. Corporations benefit far more than citizens from our shared resources. Examples: Riverview Dairy. Data centers. Pivot irrigation.

In a recent tour of Riverview's Waubun facility, our group was told that the test for whether the dairy was depleting groundwater was to run the facility at average capacity water usage - not peakand monitor nearby residential wells for 6 days to see if they ran dry. If not, the water use permit would be granted. And while there was ongoing monitoring of water quality on site after operations began, there was no ongoing monitoring of the source water (aquifer) or of surrounding water quality.

Riverview touts the "closed ecosystem" of their facilities - wastewater and solid waste are recycled and pumped underground back to adjacent farms, who serve the dairy. That doesn't support the continuation of the aquifer/water source and landowners that depend on it.

With climate change data the past 30 years we know not expect aquifers to recharge, or for water sources to become more plentiful.

Reduce the amount of water these large facilities are permitted to use. You're supporting big business at the harm of Minnesota's residents.

Chris Sonnek **Letter 917**

Members of MPCA:

I initially wrote this Letter as a response to request from the "Land Stewardship Organization" to fight this dairy expansion. My response also fits the same purpose for public comment for West River Dairy Expansion

I'm truly disappointed in your decision to fight this preliminary permitting process for Riverview LLP or any other Livestock facility for the following thoughts and reasons. -

There are already Strict Federal, State, County, and Township thresholds and regulations put into place to address the multitude of concerns any Livestock operation operates within.

The manure can be handled through digester system and the Methane Gas used to generate electricity to power the operation.

Compost can be made and sold in multiple ways to surrounding farmers or bagged up and sold throughout United States.

Humus can be made from the manure as well and used in the multitude of Biological products in the Fertilizer Industry. (Organics Included)

The remaining liquid still makes an excellent renewable fertilizer option to the area farmers. Who are you (Land Stewardship) to decide as an organization how many animal units are too much?

I had a personal friend that expanded his 70-cow dairy to 500 cows back in the late 90's. I had my own 35 cow herd for 20 years and had considered the same option to expand my herd. Instead, choose to follow the opportunity to be involved in a Sow Coop.

30 years ago, a group of 12 farmers, myself included, established a 2,400 Head Sow unit that was built on my 170 Acre farm.

We all experienced this same outrage that you are promoting yourselves now.

I heard a Quate while attending a MN Pork Producer Seminar that said "In the Lack of Sound Science Based information, Outrage Drives Perception" How True and fitting is that Quate unfolding right now for this proposed Dairy Expansion.

All Livestock operations can create beneficial opportunities to other area farmers and communities.

I've had the privilege to attend a few of your different Seminars and on Farm presentations.

My suggestion for Land Stewardship Organization and yourself, Continue to offer Educational Seminars, Hands on Field Days, Informational communication via email, texting, Facebook, Tic Tok or whatever the upcoming communication tools that develop. We will be able to Learn and see these alternative ways of farming and decide individually whether it warrants the risks, efforts to pursue those new paths forward.

In the end of the day, Economics still play a Huge role in every decision that each and every one of us must do remain viable. Doesn't matter how big or how small, at the end of the month, we all have to pay our bills to remain in agriculture.

Thanks for your time

Chris Sonnek

Samantha Meurett **Letter 918**

This is a horrible, environmentally unfriendly idea. Dairy is becoming less popular, not more.

Karen Locke **Letter 919**

I am against this expansion. In addition to the harms of water usage and potential pollution, it would harm the economy because of the huge scale taking away the ability of smaller farmers to compete.

Please deny their request.

Dave Vipond **Letter920**

Dear MPCA Review Team,

I am writing to express my strong support for Riverview Farms' plans to expand their West River Dairy operation.

I grew up on a small dairy farm and saw firsthand how environmental practices and oversight can vary across operations. Smaller, unregulated dairies are often not held to the same environmental standards,

monitoring, or accountability as modern, permitted operations. That experience has given me a strong appreciation for farms like Riverview that operate transparently under strict regulatory oversight.

Riverview Farms is among the best at what they do. They are highly environmentally conscious and consistently go the extra mile to ensure their operations protect land, water, and surrounding communities. They do not cut corners. Their long-standing commitment to responsible manure management, water protection, and environmental compliance is well documented and proven through their existing operations.

The additional cows proposed as part of this expansion are not introducing anything new or untested. Riverview Farms has extensive experience managing operations of this size safely and responsibly. The current Environmental Assessment Worksheet (EAW) process is doing exactly what it is intended to do—evaluating potential impacts and ensuring environmental protections are in place.

Based on Riverview Farms' proven track record and the safeguards provided through the EAW process, this expansion does not warrant a full Environmental Impact Statement (EIS). The existing environmental review process already provides adequate protection for Minnesota's natural resources while allowing responsible agricultural operations to move forward.

Riverview Farms has shown that agricultural growth and strong environmental stewardship can go hand in hand. I respectfully encourage the MPCA to consider their outstanding environmental record and support the proposed West River Dairy expansion.

Thank you for your time and consideration, and for the important work you do to protect Minnesota's environment.

Sincerely,

Dave Vipond

Jacob Sklar **Letter 921**

To whom it may concern/Dear blank

I am a Rabbinical Kosher Supervisor for the Midwest area that oversees many different facilities involved in kosher production. Part of doing so requires very close involvement in the inner workings of each facility. River View Farms makes kosher supervision a pleasant experience thanks to their professional, cooperative team and well-organized, sanitary facilities, among many other reasons. Their production is done with the highest level of sophistication, from simply being an organized, well-done affair to their highly environmentally conscious policies. They efficiently milk their cows while strictly maintaining very humane conduct, showing their impressive ability to efficiently get a job done with integrity. In a similar vein, River View Farms maintain an impressive level of cleanliness in their buildings, which directly coincides with the absence of the unpleasant odor that is commonly present in milk farms. Simply put, their environmental impact is minimal to practically non-existent. As a kosher supervisor for the entire Midwest, River View Farms is an excellent asset to the farming industry; that only improves that market when expanded.

James Lubenow **Letter 922**

My name is Jamie Lubenow, and I am the owner of Wagner Company, an excavating company that works alongside agricultural operations throughout West Central Minnesota. I am writing in support of the proposed West River Dairy expansion in Stevens County.

Through my work, I have had the opportunity to work with Riverview Dairy and have seen firsthand how they operate. They run a professional, well-managed operation and take their responsibilities seriously, both from a construction standpoint and in how they approach long-term planning and compliance.

Projects of this scale require detailed engineering, careful site preparation, and strict adherence to environmental and construction standards. In my experience, Riverview Dairy has consistently worked with qualified professionals and followed those standards closely. These are not casual projects, and the level of coordination and oversight involved reflects that.

I also want to speak to their environmental approach. Based on my experience working with them, they take environmental responsibility seriously and are continually working to improve their practices and reduce their impact. That commitment shows in how they plan and execute their projects.

This type of expansion also plays an important role in supporting rural economies. It creates steady work for local contractors, suppliers, and service providers, and contributes to the overall stability of communities that rely on agriculture.

I strongly encourage the MPCA to approve this project and allow the expansion to move forward. This is a well-run operation with a proven track record, and this project represents responsible growth that will benefit both the local economy and the broader community.

Thank you for your time and consideration.

Monte Strelow, Strelow Ranch Trucking — Letter 923

ATIN: Charles Peterson

My name is Monte Strelow, and I am an owner of Strelow Ranch Trucking. In my role, I work directly with agricultural operations across Nebraska, including in Riverview, Stevens and I am writing to share my support for the proposed West River Dairy expansion in Stevens County.

Through important my day-to-day work in trucking and agriculture industry, I see firsthand how important strong livestock operations are to keeping rural economies moving. Businesses like Riverview provide steady work not only for producers, but also for those of us in supporting roles such as transportation, feed supply, and other agricultural services.

From my personal experience working with Riverview, they have consistently been professional, organized, and dependable. That level of reliability is critical in this industry, and it has a positive ripple effect on everyone connected their operations.

The proposed expansion will bring real economic opportunities to the area. It will create additional demand for local contractors, support long-term employment, and increase business for companies that serve agriculture. For people like me, it represents continued stability and the ability to support our families through this line of work.

Rural communities depend on continued investment in agriculture to remain strong. Projects like this help ensure those communities can grow, maintain jobs, and support local businesses well into the future.

Based on my experience in the industry and the strength of the state’s environmental review process, I do not believe an Environmental Impact Statement is necessary for this project. I respectfully ask that you support and approve the West River Dairy expansion.

Sincerely,

Monte Strelow

Strelow Ranch Trucking

Linda Olson **Letter 924**

Aside from the obvious pollution issues, mega-dairies like this saturate the market, driving smaller producers out of business. And of course, there's the well-known fact that factory farming is harmful to the animals farmed. They are treated like products, not living beings.

Leah Rogne **Letter 925**

I oppose the approval of a dairy operation of this size in this location. The concentration of animals is unhealthy and the competition with local dairy operations is unacceptable. Any investigation should go beyond an Environmental Assessment Worksheet and should include extensive testing for airborne and water-carried pollution and thorough examination beyond a cursory look at the potential harm.

Robert Rutkowski **Letter 926**

Community members and advocacy organizations have raised questions about whether the impacts of an operation this large can be managed safely, including:

Manure volume:

18,855 cows would produce an estimated 285,000 gallons of manure every day — about 520,000 tons per year — nearly 40% of Morris's daily water use

Groundwater risks:

Potential contamination from manure storage and land application

Drinking water:

Increased nitrate levels that can threaten private wells and public health

Air quality:

Odor and emissions that affect the quality of life for nearby residents

Farm consolidation:

Pressure on small and mid-sized family farms and a continued "get big or get out" model

Cumulative impacts:

Multiple large CAFOs are concentrated in one region, with limited oversight

Market Saturation:

Mega-dairies like Riverview dominate the milk market, and expanding this facility would further flood it, making it even harder for small farms to survive

Ian Vogel **Letter 927**

The idea of putting almost 19,000 cows in one confinement setup seems absurd, but I think it's important to be open to business growth and expansion and to make informed decisions based on data. With that being said, moving forward on a project like this without completing a full EIS is irresponsible and would be a dereliction of duty for state officials overseeing the project if permitted.

We only get one shot at getting this right. Please do the right thing. Complete and EIS so that the decision makers have the best possible data to make the best decision for the people of Stevens County and the citizens of Minnesota.

We love agriculture, but not all ag business models are good for the environment or their neighbors.

Christopher Carlson **Letter 928**

A full Environmental Impact Statement (EIS) is needed, only a more in-depth review can fully assess the unique risks posed by such a massive dairy operation.

Reasons listed below.

Manure volume:

18,855 cows would produce an estimated 285,000 gallons of manure every day — about 520,000 tons per year — nearly 40% of Morris's daily water use

Groundwater risks:

Potential contamination from manure storage and land application

Drinking water:

Increased nitrate levels that can threaten private wells and public health

Air quality:

Odor and emissions that affect the quality of life for nearby residents

Farm consolidation:

Pressure on small and mid-sized family farms and a continued "get big or get out" model

Cumulative impacts:

Multiple large CAFOs are concentrated in one region, with limited oversight

Market Saturation:

Mega-dairies like Riverview dominate the milk market, and expanding this facility would further flood it, making it even harder for small farms to survive

Steven Vogel **Letter 929**

I was born and raised and educated in neighboring Wisconsin, but have worked and lived in the Washington, DC suburbs since 1977. I am extremely concerned about whether the impacts of an operation this large can be managed safely, including:

1) **Manure volume:**

18,855 cows would produce an estimated 285,000 gallons of manure every day--about 520,000 tons per year--nearly 40% of Morris's daily water use.

2) **Groundwater risks:**

Potential contamination from manure storage and land application.

3) **Drinking water:**

Increased nitrate levels that can threaten private wells and public health.

4) **Air quality:**

Odor and emissions that affect the quality of life for nearby residents.

5) **Farm consolidation:**

Pressure on small and mid-sized family farms (like the ones both of my parents grew up on in southwestern Wisconsin) and a continued "get big or get out" model.

6) **Cumulative impacts:**

Multiple large CAFOs are concentrated in one region, with limited oversight.

7) **Market Saturation:**

Mega-dairies like Riverview dominate the milk market, and expanding this facility would furtherflood it, making it even harder for small farms to survive.

For all of the above solidly fact-based reasons, I respectfully but sincerely urge the MPCA to reject the expansion of this CAFO.

Kally Goschke **Letter 930**

This would be a monopoly that would alter the market and push out smaller dairies.

I request an extensive EIS and animal welfare issues investigation of current operation. It looks like they are not caring for current animals by the look of their calves especially, let alone thousands more!

I don't think we should be bearing the costs of this mega CAFO. Their manure plan is not adequate. I live near Minnesota River and can see the impacts of current nutrient load and hydrology.

Pomme de Terre River watershed.

This watershed already shows documented nutrient stress, including elevated nitrate levels in local surface waters and connected basins. Given these existing conditions, the proposal should be evaluated not in isolation, but in terms of cumulative nutrient loading.

1. Nitrate Loading and Existing Impairment

The addition of manure from a significantly expanded herd, applied across approximately 13,000 acres, will increase total nitrogen inputs in a watershed that is already exhibiting nitrate concerns. Even with best management practices, it is well established that a portion of applied nitrogen is not taken up by crops and is instead transported via leaching and runoff.

I request that MPCA require a quantitative cumulative nitrogen loading analysis demonstrating that this project will not worsen existing nitrate conditions in receiving waters.

2. Tile Drainage and Rapid Transport Pathways

The project area includes extensive subsurface tile drainage, which creates direct hydrologic pathways from fields to ditches and streams. This significantly reduces natural attenuation and increases nitrate delivery to surface waters.

I request that MPCA require specific analysis of tile-drain contributions to nitrate transport, rather than relying solely on general nutrient management assumptions.

3. Groundwater Protection

The region relies heavily on groundwater for drinking water. Land application of manure at this scale presents a risk of nitrate leaching to aquifers, particularly in vulnerable soils.

I request that MPCA require:

* Expanded groundwater monitoring wells in application areas

* A clear nitrate threshold response plan if levels increase

4. Manure Storage Risk and Extreme Weather

While the proposal includes lined manure storage basins, extreme precipitation events are increasing in frequency and intensity. Overflow or application during saturated conditions could result in significant nutrient releases.

I request evaluation of climate-adjusted storage capacity and land application timing safeguards.

5. Water Quantity Impacts

The proposed groundwater appropriation (over 200 million gallons annually) raises concerns about local aquifer drawdown and potential impacts to connected surface waters and wetlands.

I request a cumulative water balance analysis evaluating impacts to nearby water bodies and ecological systems.

6. Anti-Degradation and Downstream Impacts

As the Minnesota River system is already impaired in many reaches, additional upstream nutrient loading may contribute to downstream degradation.

MPCA should evaluate this project under anti-degradation standards, ensuring it does not contribute to further impairment.

Conclusion

Given existing nitrate concerns in this watershed, approval of this expansion without robust, site-specific cumulative impact analysis would pose a significant risk to both surface water and groundwater quality. I urge MPCA to require additional study, monitoring, and enforceable safeguards before considering permit approval.

Manure volume:
18,855 cows would produce an estimated 285,000 gallons of manure every day — about 520,000 tons per year — nearly 40% of Morris's daily water use

Groundwater risks:
Potential contamination from manure storage and land application

Drinking water:
Increased nitrate levels that can threaten private wells and public health

Air quality:
Odor and emissions that affect the quality of life for nearby residents

Farm consolidation:
Pressure on small and mid-sized family farms and a continued "get big or get out" model

Cumulative impacts:
Multiple large CAFOs are concentrated in one region, with limited oversight

Market Saturation:
Mega-dairies like Riverview dominate the milk market, and expanding this facility would further flood it, making it even harder for small farms to survive

Cynthia Huse **Letter 931**

Riverview Dairy LLC has the right in our capitalistic and democratic society to propose an expansion of operations. This current herd expansion at a single location, however, is extraordinary in the resources required to plan, build and maintain this unprecedented project proposal. The consequences of this project for the wider human and natural community as well as air, water, soil and infrastructure need to be carefully studied in proportion to the proposal. Therefore I urge a full environmental review. Half measures will avail the wider context nothing in the face of this unprecedented request.

Megan O'Hara **Letter 932**

This MEGA dairy operation will seriously impact water quality across the region. Water is a commonly held resource, critical for life and health, and it doesn't respect county or municipal boundaries. Minnesota is made of water and we cannot keep exploiting it. Please respect the rights of other dairy farmers, the health and welfare of children and families and the water quality of Minnesota. Riverview is simply too large an operation for the land and water to support and for the health of residents throughout the state!

Yvonne Weber **Letter 933**

I have concerns about whether the impacts of an operation as large as the West River Dairy Expansion can be managed safely, including:

Manure volume:

18,855 cows would produce an estimated 285,000 gallons of manure every day — about 520,000 tons per year — nearly 40% of Morris's daily water use

Groundwater risks:
Potential contamination from manure storage and land application

Drinking water:
Increased nitrate levels that can threaten private wells and public health

Air quality:
Odor and emissions that affect the quality of life for nearby residents

Farm consolidation:
Pressure on small and mid-sized family farms and a continued "get big or get out" model

Cumulative impacts:
Multiple large CAFOs are concentrated in one region, with limited oversight

Market Saturation:
Mega-dairies like Riverview dominate the milk market, and expanding this facility would further flood it, making it even harder for small farms to survive

Mark Roalson **Letter 934**

There are many things to consider on this issue. Large CAFO consolidations threaten small farmers and basically crowd out the small farm enterprise market-share wise and in available land and possibly permitting as well.

Manure is always a logistic issue. How is this (285,00 tons a day) going to be handled and controlled? Is it going to seep through its containment area and get into groundwater? Will nitrates eventually get into local drinking water? What are the preventive measures that will keep groundwater and drinking water free of contaminants? Air quality is a concern for local home-owning residents. People with lung and breathing issues will have a difficult adjustment, and maybe having to move.

I am not against dairy farming, but I know from experience that the bigger the animal agriculture system, the more chance there is not only of pollution, but the likelihood of disease increases and the need for more antibiotics arises. That is why we have the high antibiotic resistance factor of bacteria and in other human pathogens today. Creating more opportunity for pathogens to become resistant to antibiotic chemicals is a bad idea. Show me a CAFO that does not use large quantities of preventive anti-pathogenic chemicals today. There are none.

Melissa Heinen **Letter 935**

Concerned about the expansion of the West River Dairy and what it could mean for our water, air, and soil. Please be sure to carefully understand the possible long-term impacts on our environment and communities.

Roger Wacek **Letter 936**

Several years ago I listened to a SWCD (Soil & Water Conservation) official talk about measured nitrate contamination of aquifers in the Karst Region of SE Minnesota; Lets get SWCD comments on an EAW (Environmental Assessment Worksheet).

Jan Joannides **Letter 937**

This type of consolidation in agriculture is not good for our environment, rural communities, water quality (and availability), or animal welfare. I oppose the expansion.

Nathan Collins **Letter 938**

c/o Charles Peterson

I support the expansion of Riverviews West River site.

I have farmed around and worked with Rivrview for 25 years, have seen the benefits to the community and surrounding farms, helping keep both vibrant and alive.

This process is to be fact and performance based and not emotional, and if this process does not remain as such, it will have a devastating impact on dairy's of all size in Minnesota! And the entire state will feel the repercussions.

Therefore, I believe the current review process is sufficient and that additional regulatory steps, such as a requirement for an environmental impact statement (EIS), are unnecessary.

Thank you

Nathan Collins

Linda Herron **Letter 939**

With such a large cow population (11,000), the need for a complete Environmental Impact Statement(EIS) is obvious. Such an immense feedlot has a strong potential for water pollution(including groundwater) as well as land (where manure wastes are stored) and air pollution (methane gas).

Considering past applications of the environmental laws in Minnesota, enforcement of existing laws has been spotty. As a Minnesota resident and taxpayer, I urge the MPCA to follow best practices and require an EIS before any enlargement of the facility is approved.

Thank you for the opportunity to comment.

Amy Flatten **Letter 940**

Dear Charles Peterson and the Minnesota Pollution Control Agency,

I write to you today to share I do not support the expansion of the West River Dairy CAFO Operation. I am concerned of the irreversible impact huge dairies like this place on our natural resources.

I have worked on a farm, previously lived in a rural town, and have learned about the impact of CAFO's. I have even worked in dairy manufacturing in Wisconsin and understand the importance of the dairy industry, but supporting such huge corporations like this is not beneficial to the local economy or environment in the long-term.

Please do not allow such a big operation to push their weight around and exceed current animal unit limits.

Thank you for considering the implications of a CAFO of this magnitude.

Kindly,

Amy Flatten

Phillip Lermon **Letter 941**

I think this project is about more than Synnes Township. A dairy this size affect the markets for milk in all of Minnesota. Dairy is very important to my area of the state, our rolling pastures and fertile soils make it about perfect for dairy farming. This huge project is detrimental to the milk markets and will drive dairy out of my part of the state. It will without a doubt pollute the shallowest aquifier and surrouding streams. I also have a family member who lives in a valley 3 miles from a 2000 head dairy. There are many days they can't go outside as the stench is so strong, especially in the spring and fall when they apply slurry from the pits. I can't imagine how awful this operation stinks. It stinks this bad because it's completely unnatural way to raise animals. This dairy and it's feed suppliers will use huge farm equipment, which means bigger fields, and more erosion. They will farm more marginal lands intensively not because it makes economic sense, but just because it's more convenient for the larger equipment. That's what is happening around our area. Riverview Farms is not a farm, it is a corporate conglomerate.

Brian Miller **Letter 942**

ATTN: Charles Peterson

My name is Brian Miller, recently retired from Merck Animal Health where I worked as a Dairy Technical Services Veterinarian. In this role, I served dairy producers and practice veterinarians primarily in the upper Midwest including the state of Minnesota. I worked as an industry veterinarian for over twenty

years. Prior to my industry career, I was in private practice as an owner/partner of Whitewater Veterinary Hospital, Whitewater, WI for more than twenty years.

Over the course of my industry career I have witnessed firsthand the growth of the Riverview operation, and I have personally visited many of their sites that are located in multiple states. Riverview is an extremely responsible operation that provides state of the art facilities, nutrition, and management incorporating protocols that maximize the health and wellbeing of the animals under their care. In addition, they possess high standards of land and manure management and have been good stewards of the land and good neighbors to those around them. I am writing in support of their proposed West River Dairy expansion in Stevens County.

American agriculture sector, and the people it feeds, depend on a strong and stable dairy industry. Operations like Riverview are key to this vital process as they provide milk and meat to countless consumers. They also create consistent economic growth that supports local jobs and drives investment and reinvestment in the communities in which their operations are located.

Their proposed expansion represents a meaningful economic benefit to Stevens County. The expansion will generate demand for local vendors, will support construction and long-term employment, which will contribute to the vitality of this rural community that relies on agriculture.

In closing, from direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where their dairy operations are located. Their presence strengthens local economies and supports a broad network of agricultural and service-related businesses. Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures local businesses will continue to provide jobs, services, and economic stability within a region.

No Environmental Impact Statement is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important expansion project.

Sincerely,

Brian E. Miller, DVM

Sharon Fortunak **Letter 943**

The proposed West River Dairy Expansion should not be approved. In addition to the harmful effects to the environment, it is also animal abuse!! Cows need space for exercise and herd socialization. No one needs a farm that large!! Case closed!!

Laurence Margolis **Letter 944**

Minnesota's largest dairy producer, Riverview LLP, has applied to build the first livestock facility in Minnesota. If built, the facility will hold 18,855 dairy cattle, bringing the total animal units to 26,397 in one place. This proposed expansion would be nearly double the size of the next largest livestock operation in our state in terms of animal units. This expanded Riverview facility would be more than 60 times the size of the average Minnesota dairy, which had fewer than 280 cows in 2025. This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

Riverview, based out of Morris, Minn., is one of the largest milk producers in the country. The firm now owns 16 permitted dairy CAFOs in Minnesota alone, and these facilities house a total of more than 135,000 cows, according to the Star Tribune. That accounts for nearly a third of the state's entire dairy

herd. Riverview also has a major presence in North Dakota, South Dakota, Nebraska, New Mexico, and Arizona.

The Minnesota Pollution Control Agency (MPCA), which is the agency that issues Minnesota's feedlot permits, must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview must be required to undergo a full environmental impact statement (EIS). We should be supporting more family run dairy farms.

Mark Hockel **Letter 945**

Dear Mr. Peterson,

I respectfully submit this letter in support of Riverview LLP's proposed expansion of West River Dairy near Morris, Minnesota. I am an agronomist with decades of experience advising producers on crop production, nutrient management, and soil health. I have worked extensively with dairy and livestock operations on manure application planning, soil fertility management, and the agronomic value of organic nutrient sources. In my opinion, based on my review of the EAW and the draft feedlot permit, no EIS is needed.

In my professional experience, properly managed manure application is one of the most effective tools available for building long-term soil health while simultaneously providing crop nutrients that would otherwise need to be supplied by commercial fertilizers. The proposed expansion includes a comprehensive Nutrient Management Plan covering over 16,000 acres of currently tilled cropland identified for manure application. This plan reflects appropriate and careful planning.

The agronomic benefits of manure application are well-documented. Manure supplies nitrogen, phosphorus, and potassium—the three primary macronutrients essential for crop growth—along with secondary nutrients and micronutrients often absent from commercial fertilizer blends. Equally important, manure adds organic matter to the soil, which improves soil structure, water-holding capacity, infiltration rates, and aggregate stability over time. These improvements translate directly into more productive soils that are also more resilient to drought and heavy rainfall events.

From an agronomic and economic standpoint, the availability of manure as a locally produced organic fertilizer represents a significant value to area crop producers. In the current fertilizer market environment, the nutrient value of manure can offset substantial commercial fertilizer costs for participating landowners, while also delivering soil health benefits that commercial fertilizers alone cannot replicate.

Concerns about nutrient runoff from manure application are understandable, but the scientific evidence—including research published by the MPCA itself—demonstrates that when manure is properly incorporated into the soil, it actually reduces the risk of runoff and soil erosion compared to untreated fields.

The MPCA's 2018 literature review, "Runoff Reductions with Incorporated Manure" (wq-f1-08), synthesized the results of multiple peer-reviewed studies conducted across the Midwest, including research conducted in Morris, Minnesota—the same community where West River Dairy is located.

The findings are clear and consistent:

Runoff volume reductions: Fields receiving annual applications of incorporated manure showed runoff reductions compared to fields that did not receive manure.

Soil loss reductions: Fields receiving annual incorporated manure applications showed soil loss reductions compared to fields that did not receive manure. A single application of manure in Morris, Minnesota reduced annual soil loss by 67% in the following year.

Phosphorus management: The research found that injection of liquid manure—the primary method proposed for West River Dairy's liquid manure—results in more-effective phosphorus management when compared to surface-applied manure.

The MPCA's own conclusion from this body of research is significant: all studies reviewed found that, compared to tilled plots that did not receive manure, the incorporation of manure into soil can significantly reduce runoff volume and soil loss and does not increase runoff phosphorus levels on an annual basis. The review further emphasized the importance of incorporating manure through minimum-tillage methods such as knifing or injection—which is precisely how West River Dairy proposes to manage its manure, using knife injection for liquid manure and incorporation within 24 hours for solid manure.

West River Dairy's Nutrient Management Plan reflects the best practices identified in the MPCA's research. Application rates are calculated to match crop nitrogen needs, phosphorus management restrictions are in place to prevent soil phosphorus buildup, and the plan includes best management practices for fall application timing.

From an agronomic perspective, the West River Dairy expansion's manure management plan, supported by the MPCA's own published research, demonstrates that properly incorporated manure is not an environmental liability but an environmental and agronomic asset—one that builds soil health, reduces runoff, and recycles nutrients that would otherwise require energy-intensive commercial fertilizer production. The expansion also represents exactly the kind of investment that rural Minnesota needs—one that supports processing infrastructure, creates jobs, strengthens the local agricultural economy, and provides a market for locally grown crops.

Thank you for the opportunity to provide comment.

Steve Albrecht **Letter 946**

I fully support the expansion of West River Dairy. As an employee of nearly 19 years, I can assure you that integrity is one of our core values. Without clean water and healthy soils, our dairies cannot thrive. We do everything we can to maintain this. There are several dairies across the country that are much larger than this proposed one and they have proven that it is very possible and highly likely to operate in a responsible manner. Furthermore, the positive economic impact this will have on a small rural community is very important to me, as I have young children about to enter the workforce and I hope that they can find employment close to home. Thank you for taking the time to review this comment.

Karen Neenan **Letter 947**

I am writing to say that the expansion of Riverview Dairy MUST have an in depth look. An Environmental Impact Statement must be required.

The questions of how to deal with the manure from such an operation cannot be overstated. The water usage is enormous . What will happen to groundwater supplies? The groundwater has not even been mapped in this area.

Minnesotans have been given rich farmland and an abundance of clean water. It is our task to be good stewards of these amazing resources.

Can it be possible to be a good steward and have dairy cows on this scale?

I believe not. I grew up in a dairy farm 60 miles from Morris. I am aware of the constant question "where will all this manure go."? With the incredible scale of this dairy who would believe this manure disposal and water usage will not harm those living nearby and beyond.

Groundwater supplies can be depleted quickly and recover very very slowly.

Smaller farmers are struggling to make a living, therefore smaller communities are struggling to be viable. Riverview can certainly not help either of these.

We need an Environmental Impact Assessment!

Sincerely,

Karen Neenan

Kedron Nohl **Letter 948**

I live in Stevens County and have had the opportunity to observe multiple Riverview sites. From both an operational and environmental standpoint, I have consistently seen a high level of care, cleanliness, and attention to detail in how their facilities are managed and how their cattle are treated.

Riverview partners with local farmers to grow silage, alfalfa, and other crops used to feed their animals, creating valuable opportunities for local agriculture. Their manure management practices also support a sustainable cycle by returning nutrients to the land, which I have seen benefit crop production. Manure application is highly regulated, and Riverview is held to a high standard in how it is stored, handled, and applied. From what I have observed, they take these responsibilities seriously and consistently meet those expectations.

In my experience, Riverview operates in compliance with regulations and is mindful of its impact on neighbors, roads, and the surrounding community. Their sites are well-maintained and reflect a strong commitment to environmental stewardship.

The proposed West River expansion would bring additional jobs and support to local families, schools, and the broader community. Riverview has proven to be a strong partner and a good neighbor, and I believe this project will continue with that positive impact.

For these reasons, I fully and respectfully support the approval of the West River Dairy Expansion and believe the Environmental Assessment Worksheet process has been thorough and sufficient.

Thank you,

Kedron Nohl

Daniel Belgum **Letter 949**

To: MN Pollution Control Agency Officials,

I believe that Riverview Diary is already too big. The addition of some 11,000 head of dairy cows to an existing facility with 7,855 dairy cows at the Riverview West Dairy would create a significant impact not only on the water supply, and water system (Pomme de Terre River and aquifer) but also, the creatures of the area, and the total ecosystem. Where do you put all that manure? How much additional water will be needed? How many small dairy farms will this replace? In addition, this expansion, if allowed, would continue to have a deleterious effect on Minnesota's smaller dairy farmers, the small towns they support economically and socially, and as noted, the ecology of the county. It would also become the largest dairy in Minnesota in one location. I don't think any of that is good.

I encourage the MPCA to conduct an extensive, exhaustive environmental analysis on what the projected impact of this proposed dairy expansion would mean for Stevens County; and the state's small dairy farmers. This proposed dairy expansion is a massive ethical issue with extensive and potentially dangerous ramifications. It also will have, one way or another, a precedent-setting impact. It must be treated as such. The citizens of Minnesota expect the MPCA to do a thorough job of environmental reviewal.

John Pierce **Letter 950**

This Dairy represents a pollution (health) risk at a time of compounding environmental issues to water quality, air quality, and emissions reductions in the state of Minnesota. It does not make sense to expand confined dairy at this location as proposed in the documents.

Joan Meierotto **Letter 951**

It is unconscionable to even contemplate having that many animals confined within this small area.

Daryl Maulfair **Letter 952**

My family and I have lived in Morris for 9.5 years. We moved from Pennsylvania to Morris for the opportunity for me to work at Riverview as an on-staff nutritionist for their cattle. We have owned a home in Morris for that entire 9.5 years, we are parishioners of Assumption Catholic Church and our children attend St. Mary's Catholic School. We have become active members of the Morris Community in many ways. This would have not been possible without the opportunities afforded by Riverview's previous growth and this expansion will provide many more opportunities for people in this community and in the agriculture industry. Please see my attached comments on why the EAW shows that an additional EIS is not needed.

Public Comment in Support of the West River Dairy Expansion

EAW Comment Period: February 10 – May 7, 2026

Submitted to: Charles Peterson, MPCA Resource Management and Assistance Division

I am writing in support of the proposed West River Dairy Expansion in Synnes Township, Stevens County, and to respectfully urge the MPCA Commissioner to issue a negative declaration on the need for an Environmental Impact Statement. Having reviewed the Environmental Assessment Worksheet (EAW), the Notice of Availability, and the supporting attachments, it is clear that the project has been thoughtfully designed, that its potential environmental effects have been carefully studied, and that those effects are localized, controllable, and well within the limits of existing state and federal regulatory programs. The EAW does precisely what the State of Minnesota intends it to do: it lays out the basic facts of the project and demonstrates that an EIS is not warranted.

Why the project should be allowed to proceed

Riverview, LLP proposes to expand the existing 7,855-cow West River Dairy by adding an 11,000-cow facility on adjoining cropland that is already in row-crop production. The site is in the General Agricultural District of Stevens County, with the nearest incorporated city more than five miles away, and it is fully consistent with the Stevens County Comprehensive Plan 2017, which directs feedlots of this size into precisely these kinds of agricultural areas. The project complements, rather than conflicts with, the surrounding land use: local growers will supply corn silage, alfalfa, and other feedstuffs, and the dairy will return a local, organic fertilizer to the same fields that currently rely on synthetic inputs.

The benefits are tangible. The project replaces roughly 1,545 tons per year of anhydrous ammonia with manure-based fertilizer, avoiding an estimated 9,038 tons of CO2e per year associated with synthetic fertilizer manufacture, transport, and storage. Approximately 2,200 acres of row crops will be converted to alfalfa to feed the herd, sequestering an additional 2,662 tons of CO2e per year and reducing tillage on those acres. The expansion creates skilled local employment, on-site housing for staff, sustained demand for area crops, and continued investment in the rural Stevens County economy. Riverview has operated the existing West River Dairy on this site since it received a negative declaration on the need for an EIS in 2003, and has compiled more than two decades of permit compliance, including the addition of an anaerobic digester (2008), dry manure solids storage (2010), and expanded liquid manure storage (2014). That track record matters.

Why this EAW shows that an EIS is not needed

Under Minnesota Rules, an EIS is required only when a project has the potential for significant environmental effects that cannot be adequately anticipated, controlled, or mitigated through ongoing regulatory authority. The EAW demonstrates that, on every resource category it examines, those tests are met.

Air quality and odor. Barr Engineering performed AERMOD dispersion modeling under an MPCA-approved protocol using five years of weather data. With conservative background concentrations added, modeled hydrogen sulfide concentrations at the property line (29.44 ppb) remain below the Minnesota Ambient Air Quality Standard of 30 ppb, ammonia concentrations at neighboring residences (15.11 µg/m³) are well below the 80 µg/m³ chronic inhalation Health Risk Value, and odor at the nearest non-feedlot residence (74 OU) is below the 83-OU faint-odor threshold. Impermeable synthetic covers on the liquid manure storage areas, knife injection of land-applied manure, and on-site good-housekeeping practices all reduce emissions further. (See EAW Item 17 and Attachment 13.)

Water resources. The project actually improves the water situation on this parcel. The site today is pattern-tiled cropland with no retention or treatment. After construction, three permanent stormwater basins, sized more than 20% larger than required for a 25-year, 24-hour storm, will capture runoff before any controlled release. The Engineer's Run-Off Hydrology Report (Attachment 24) shows annual runoff volume dropping from roughly 117 million gallons to 106 million gallons and modeled erosion falling from 0.41 to 0.05 tons per acre per year. There are no wetlands or surface waters on the project site, and the LMSAs use 60-inch compacted clay liners

(well above the required minimum), perimeter drain tile for monitoring, and 14 months of storage capacity rather than the required nine. Groundwater appropriation is governed by DNR Permit #2008-0230, which conditions pumping rates on real-time Pomme de Terre River flow and includes a complete cessation requirement when river flow drops below 15 cfs. (See EAW Items 11, 12, and Attachments 22–26.)

Manure management. Local producers have offered more than 16,500 acres for manure application, while the project and existing facility together require only about 13,200 acres — a buffer of more than 3,000 acres that provides operational flexibility, eliminates pressure to apply on unsuitable fields, and effectively rules out winter application. Manure is knife-injected at agronomic rates per an MPCA-approved Manure Management Plan, sampled annually, and tracked through the MPCA's Nutrient Management Tool. Setbacks meet or exceed state, Stevens County, and Swift County requirements. (See EAW Item 12.B.5 and Attachment 23.)

Wildlife, rare features, and cultural resources. DNR Natural Heritage and U.S. Fish & Wildlife Service IPaC reviews identified no federally or state-listed endangered species at the project site. Where threatened or special-concern species were flagged near manure application areas, the Proposer either removed those parcels or confirmed that the row-cropped fields do not provide suitable habitat. The State Historic Preservation Office, the Office of the State Archaeologist, and a Phase I archaeological assessment by Agassiz Archaeology cleared the project site, the waterline route, and the manure application sites. (See EAW Items 14 and 15, and Attachments 6–7.)

Noise, traffic, and cumulative effects. Modeled noise at the nearest residence is effectively at background. The project would add roughly 45 vehicles per day to County Road 8, an 8.7% increase well below any threshold that would trigger a traffic study. The Proposer also delineated an Environmentally Relevant Area encompassing the project, all manure application acres, and a one-mile buffer around the off-site well, ensuring that no other reasonably foreseeable project overlaps environmentally with this one. (See EAW Items 19–21.)

Regulatory authority is sufficient to anticipate and control the effects

The EAW catalogs an unusually thorough package of overlapping permits and approvals: an MPCA Individual NPDES Feedlot Permit, a Construction Stormwater Permit, two DNR Water Appropriation amendments, a DNR Dam Safety permit, a Utility Crossing License, a Stevens County Conditional Use Permit, and SSTS permits. Each carries enforceable conditions, monitoring obligations, and inspection regimes. This is exactly the framework Minnesota's environmental review program contemplates when it asks whether environmental effects can be adequately addressed through ongoing public regulatory authority. They can be, and they will be.

Conclusion

The West River Dairy Expansion EAW is a complete, well-documented, and conservative environmental review. It identifies the project's potential effects, quantifies them against state standards, and shows that mitigation, project design, and existing permit programs reduce those effects to levels that are not significant. An EIS would not produce materially better information, would delay a project with clear local benefits, and is not justified on this record. I respectfully urge the MPCA to issue a negative declaration on the need for an EIS and to allow the project to proceed under its proposed permit conditions.

Respectfully submitted,

Daryl Maulfair

Jon Nohl — Letter 953

To Whom It May Concern,
I am writing this comment in favor of the West River Dairy Expansion project. As a farmer near multiple Riverview dairy operation's I can say that they are good neighbors. Their dairy's have given us options

for marketing crops and purchasing manure (to replace commercial fertilizer) that have brought additional competitiveness to our family farming operation. They are good stewards of the land and natural resources and are great people to work with. I would encourage the respective governmental agency's to approve the expansion project as I believe current environmental review concerning the project is adequate and the project should be allowed to move forward.
Sincerely,
Jon Nohl
Farmer near Hancock, Minnesota

Kendall Wendling **Letter 954**

We have been working with Riverview for a few years now. They are nice to work with and take good care of those around them.

Lance Lindeman **Letter 955**

My family and I need to have a comprehensive environmental review of this project. As a landowner with a private well in west central Mn, we do not believe there is enough evidence that our groundwater will not be negatively affected by this operation and others like it.
Also the amount of water to be used in the ongoing operation is also detrimental to other private wells with West Dairy's single well drawing down groundwater levels in the area.

Emilie Evink **Letter 956**

The EAW is comprehensive and complete. No EIS is needed.

Christian Cabrera **Letter 957**

I've been living in Morris for 13 years and I support the West River expansion no EIS required.

Luis López **Letter 958**

I support west river expansion. Not EIS required

Jose Castro **Letter 959**

I support the west river expansion, no IES required

Sergio Vazquez **Letter 960**

I support the project of Westriver expansion No EIS is need

Alejandra Vazquez **Letter 961**

I support the proposed expansion of Riverview. This project would bring economic benefits to the community, including jobs and local growth. I believe Riverview can operate responsibly while meeting environmental standards, and I trust that proper regulations will ensure any impacts are managed safely. I encourage approval of this permit so the community can benefit from this opportunity. I don't think EIS is really necessary

Mario Cervantes **Letter 962**

I support the West River expansion, no EIS required!

Ernesto Hernandez montellano **Letter 963**

I support the West Riverview expansion. No EIS required

Juan pablo Brom **Letter 964**

I support the West Riverview expansion. No EIS required

Lizeth Carmona **Letter 965**

I support the project and EIS is not needed.

Diego Gutiérrez **Letter 966**

I support West River/Riverview expansion. No EIS required.

Julio Villagomez **Letter 967**

We support the West River/Riverview expansion. No EIS needed.

Pedro Garcia **Letter 968**

I support West River/ Riverview Expansion. No EIS required

Carlos Daniel Rosiles Gallegos **Letter 969**

I support the west river river view expansion not is requeriet

Jenessa Solvie **Letter 970**

I support the West River Dairy expansion. No EIS required.

Jose Gutierrez **Letter 971**

I support the west river riverview expansión. No EIS required.

Helstrom G Sanchez **Letter 972**

I support the West Riverview expansion, it will create more job opportunities, direct and indirect, and will be beneficial for the region in the long run. No EIS is necessary, the company has show good management of the natural resources.

Yahveh Carrillo **Letter 973**

I support the West River Dairy expansion. No EIS required

Juan Carlos Garnica Montes **Letter 974**

Estamos a favor de west river

William Ojeda **Letter 975**

I support the west River/Riverview expansion. No EIS required.

Librado Ortiz **Letter 976**

"I support the West River/Riverview expansion. No EIS required."

Omar Ali Salinas **Letter 977**

I support the West River/Riverview expansion, No EIS required

Leonel Chavez Salas **Letter 978**

I support the West River expansion. No EIS required.

Tatiana Gutierrez **Letter 979**

I support the West River/Riverview expansion. No EIS required

Carlos Ivan Romero Ramos **Letter 980**

I agree with the expansion; I think it's a great idea and an opportunity for everyone.

Moises Moreno **Letter 981**

I support the West River/Riverview expansion. No EIS required

Antonio Cruz Magdalena **Letter 982**

I support the west river expansion.

Rosa Arenas Benitez **Letter 983**

I support the West Riverview expansion. No EIS required.

I support West River/Riverview expansión. No EIS required

Hugo Sanchez Arenas **Letter 1014**

I support the west river dairy expansion. No Environmental Assessment needed.

Berenice Huescas **Letter 1015**

I support the West Riverview expansion. No EIS required

Kurtis Wulf **Letter 1016**

My name is Kurt Wulf and I have lived in Stevens County my entire life. As a member of the Morris Area School I have seen the generosity of Riverview first hand. They donate to the school on a regular basis as well as many other community programs such as 4H, FFA and the County fair. When evaluating a project like this dairy, is there any consideration to what Riverview has willingly given back to our community? I

support this dairy project getting built and see no reason to require more study or permitting. Thank you for your work on this permit.

Jesus Galindo Hernandez **Letter 1017**

I support a west river Dairy

Miguel Urrutia Calvo **Letter 1018**

As a member of the Morris Public Schools Board of Education, My comment is to share my strong support for the proposed West River Dairy expansion. In my role on the school board, I focus on what helps our students and community grow and succeed over time. I would also like to note that I am an employee of Riverview LLP.
From what I see in our community, projects like this make a real difference. When there are new opportunities and jobs, more families choose to move to or stay in the area. That leads to higher student enrollment, which is very important for our schools. Strong enrollment helps us keep and improve programs, support our teachers, and continue offering activities and opportunities that benefit all students.
There is also a clear connection between a growing local economy and stronger support for schools. As communities grow, we tend to see more involvement from families and local businesses; whether through donations, partnerships, or simply being more engaged. That kind of support creates a better environment for our students to learn and succeed.
Most importantly, this kind of growth benefits students directly. It helps create a more stable and vibrant community, gives students access to more opportunities, and strengthens the connection between schools and the real world. These are the kinds of factors that help prepare students for their future and encourage them to stay and invest back into the community. Riverview has shown that it values being part of the communities where it operates, and I believe this project is another step in that direction.
For these reasons, I respectfully encourage the MPCA to consider the positive impact this project can have on our students and community and to move forward with the permitting process in a timely manner. Thank you for your time and consideration

Karen Campos **Letter 1019**

I support expansion of west river

Ramos Jaimez **Letter 1020**

I support the West Riverview expansion. No EIS REQUIRED

Mitch Koehl **Letter 1021**

I support the West River Dairy expansion. I feel the MPCA has done sufficient work with the EAW and no EIS is needed. Riverview has a proven track record of proper manure management. I have lived within less than 1 mile of one of their existing dairies for over 17 years and there has never been any issues causing environmental concerns. Their manure is a preferred source of fertilizer for our crops. They have provided a huge benefit to our region.

Carlos Portillo **Letter 1022**

I support west river dairy expansión no ELS Requierd

José Borjas Gonzales **Letter 1023**

I support west river dairy expansion no els required

Valente Fuentes **Letter 1024**

I support west River expansión.

Miguel Cruz **Letter 1025**

I support west River/Riverview expansion. No EIS required

Kyle Fehr **Letter 1026**

I am in full support of the West River expansion. No EIS needed.

Dylan Reese **Letter 1027**

I am in full support of the West River expansion. No EIS needed.

Oscar Neri **Letter 1028**

I am in full support of the West River expansion. No EIS needed.

Oscar Celaya **Letter 1029**

I agree with with West River expansion, no EIS required

Lucio Santiago **Letter 1030**

I support the West Riverview expansion. No EIS required

Alton Ekren **Letter 1031**

I strongly support this project, an EIS is not needed.

Christofer Ruiz **Letter 1032**

I support the West Riverview expansion. No EIS required

Misael Carrasco **Letter 1033**

I support the West Riverview expansion. No EIS required

Victor Morales **Letter 1034**

I Suppot west river dairy

Carlos Alba Mora **Letter 1035**

I support the west River Dairy expansión. No EIS requiered.

Susana Medrano **Letter 1036**

I agree with West River expansión, no EIS needed

Daniel Camacho Ramírez **Letter 1037**

I support the west Riverview expansion

Fernando Chapa **Letter 1038**

I fully support the west River dairy expansion project *No EIS required

Miguel Rodriguez **Letter 1039**

I support the West Riverview expansion. No EIS required

Heribier Ramos **Letter 1040**

I support the West River dairy expansion and feedlot permit. No EIS irequired.

Hilary Reeves **Letter 1041**

The scale of this expansion calls for an Environmental Impact Statement. The increasing severity of weather events & the already high levels of nitrogen in water already are worrying enough, for families and the health of our communities. An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit. Thank you.

Benjamin Juarez Cervantes **Letter 1042**

I support the west river dairy expansion Without EIS

Amber Ramey **Letter 1043**

An expansion of this size needs considerable investigation on the impact to the people of Morris before it is allowed. I am very concerned about the amount of water it will use and pollution it will create. I am also very disappointed in the way Riverview has tired to throw its weight around and silence people living in Morris. They had their employees pack the meeting tonight over an hour before the start time. They want to make sure no one can express concern. It really makes me wonder what else they are hiding or pushing through. This is an over reach of power and deserves to be investigated fully before proceeding.

Robert Valnes **Letter 1044**

No EIS needed for this project.

Dustin Hollermann **Letter 1045**

The proposed West River Dairy Expansion will be a net positive in regards to environmental effects. Air quality, water resources, manure management, and rare species concerns have all been thoroughly evaluated and are adequately addressed through the EAW and ongoing regulatory oversight. An EIS is not necessary and would not result in the discovery of any additional concerns.

Jared Wohlers **Letter 1046**

Minnesota Pollution Control Agency
Attn: Charles Peterson

I am a local resident to the Morris area. I attended the public meeting hosted by the MPCA yesterday evening. I found the process to be informative and thank the MPCA for providing the opportunity to attend. I have reviewed the EAW material and Feedlot application. I found the material to be factually sound and in alignment with the conversations and clarification provided by the MPCA yesterday evening. Based on the facts, understanding the process and the public meeting hosted by the MPCA I am supportive of this project. An EIS is not needed for the proposed West River Dairy Expansion.
Thanks,
Jared Wohlers

Luis C Hernandez Valenzuela **Letter 1047**

My name is Luis C Hernandez and complete support the west river project because it's a big opportunity for the area to going forward on the consolidation of development. Minnesota it's a base on agriculture and this project have all the right to be done on the best way to protect the environment and of course the community

Alberto Ochoa **Letter 1048**

Yes I support west river expansion

Helstrom Sanchez **Letter 1049**

I support the expansion of West River Dairy. I believe that Riverview has gone through potential environmental impacts thoroughly, they have enough experience and expertise, and the expansion will provide a positive benefit for the community. Thus, I believe no EIS is required.

Gordon Dalseide **Letter 1050**

First of all, this is not an expansion of the existing West River Dairy. It is a complete stand-alone new construction that could be built anywhere with little or no additional cost. It appears that very little of the existing infrastructure will be used to support this proposed project. Official Public Notice published in the Stevens County Times January 6, 2026, is misleading indicating that the expansion will take place in the NW 1/4 of section 1 Synnes Township. Are manure management acres secured by written contracts or are they simply "Handshake agreements"?
Water use is a major concern. According to Minnesota Well Index records that I have viewed River View currently has at least eight active wells and has drilled at least 5 additional test holes. Active wells range from 138' to 300' in depth. Test holes range from 302' to 418' deep. Static levels range from 90' to 119'. Pumping levels range from 101' to 200' at the time the wells were drilled. No information relating to recharge rate was found. Bed rock level is approximately 300'. Existing water wells surrounding WRD range from 75' to 340'. The 340' well just happens to be owned by a WRD employee. Looks like the same issue that people in Arizona are facing is happening or about to happen in Stevens County. My own well located 1 1/2 miles north of WRD has dropped in production from and estimated pumping capacity of 150 gallon/min to barely 3 gallon/min currently. Intensive water well testing needs to be done by independent testing company before any permit for WRD is approved.
Damage to County and Township roads during harvest are to the point that they are impassible with anything but a 4-wheel drive pick-up. Roadbeds have been displaced to the point that ditches no longer drain properly, culvert aprons have separated from nearly every culvert along my property and have had to be repaired at county expense.

Manure spills have occurred on several occasions as the result of failure to connect hoses or lack of proper monitoring. Several of these spills have been of a size requiring considerable time to clean up and occurred on public property (county road ditches).
Animal disease should be a major concern to be looked at. New World Screw worm currently less than 100 miles from the US- Mexican border is a devastating disease. Riverview transports animals between Minnesota and Wilcox AZ. almost daily. What is the Minnesota department of animal health emergency management protocol for handling such and outbreaks?
No one has discussed negative economic issues involved with the project. Farmers not participating will likely see lower bids for grain, higher prices for fertilizer and propane due to lower volumes.
Employees will be let go or have time reduced. People will have to leave the area to find full time employment.
There are many more important issues that need to be studied. The fact that the commissioner has not made an independent onsite visit and possibly even with close neighbors that are not part of WRD is a very concerning issue. Boots on the ground, ears open, smell the air, see the situation before you make a final decision. Once the damage is done it cost a lot more to fix. A full and complete study is the only option!

Lucas Anderson **Letter 1051**

I support the West River Dairy Expansion project. I feel an EIS is not necessary.

Ford Thunderbird **Letter 1052**

EIS must be done. Be only fair to everyone. Why are the riverview supporters so afraid of seeing an EIS done?
It's just 1-2 big wigs who wanted these dairies in each area. Vast majority of everyone else living in them areas don't want them to start with.
Riverview is like a mining company. They come into an area and just mine all the resources and once the resources are gone so is riverview. They are off to a new area to mine.
What many people don't know if this goes through this expansion it's just a green light to expand other sites they already own. They want to expand East Dublin dairy south of Murdock to 32,000 cows.
Looks like there is an expansion in the future at the Swenoda site in swift county south of benson with riverview recently purchasing additional 80 acres on the east side of that site close $1,400,000.00 million dollars and this late winter.
Speaking of the swenoda site. Many people well most everyone doesn't know about the huge manure spill there in the fall of 2024 that covered 65-70 acres and went into 2 separate drainage ditches a quarter apart and that manure spill was about 2.5 miles away from the Chippewa river and them drainage ditches feed directly into the Chippewa river. They cleaned it up before they reported it to the MPCA and claim it was mainly 50,000-60,000 gallons of mainly water. Very alarming and very concerning. Very disturbing especially for anyone that lives in a 5-6 mile radius of that manure spill. Probably have high nitrate levels in their drinking water from their wells.
When they manure pumping crews are mainly made up of Hispanics and South Africans who's primary language isn't English it's hard to follow rules and directions. Heaven forbid these big wigs from riverview or who are strongly affiliated with riverview get any manure on their shoes or smell like manure.
What a good show riverview put on the night of April 28th. They use a smaller venue in morris when there are 2-3 other larger venues to use in Morris. They jam it pack with all their supporters and Hispanics who work for them and who are speaking Spanish across the room to each other and one is holding up a sign in Spanish to comment on this site for approval for this expansion. Looks like a 100 plus

comments in a couple hours time last night from riverview employees. All them comments should be disregarded.
Riverview does an extremely good job getting one of their supporters and employees on every local government board possible. From township, planning and zoning,rda and school boards and and everything in between. They make sure riverview is taken care of and rest of us non supporting riverview people they make sure our voice isn't heard at all or our comments and concerns are brushed aside.
They claim they do so much for the communities they are by but yet I don't see any them riverview supporters or Riverview employees on the volunteer fire department or on the EMT. Oh wait they aren't getting paid for that and no need to protect riverview's interest on them rural volunteer positions. It will be a good day in rural Minnesota when riverview and their businesse partners are no longer in business and are broke because that is what they are trying to do everyone else in rural Minnesota now who doesn't want anything to do with them.

David Hauge **Letter 1053**

The list of infractions on the land stewardship site for this dairy shud be more than enuf to deny a permit. Groundwater and air contamination will invariably occur with such a large operation. U wud set a precedent for large dairies in se mn where the ground structure cannot support manure incorporation of such magnitude

Nicole Wagner **Letter 1054**

I think it is worth mentioning that 200+ Riverview employees were at the door two hours early to prevent citizens from being able to enter as the building was at capacity with Riverview staff. Some were able to get in but I have spoken to many people that were not. They should rectify this farce of a public meeting by using the high school which allows for 5 times the attendance.

Laura Lee **Letter 1055**

I am writing to request that the MPCA require a full Environmental Impact Statement(EIS) for the proposed West River Dairy expansion project. A farm of this size is unprecedented. We must protect Minnesota's natural resources and communities.

David Kortan **Letter 1056**

Expansion of this magnitude would be disastrous for the community in terms of the massive amount of water usage, electricity drain on the electrical grid, and massive manure that could effect ground water pollution. Also I would like to know who owns all of their dairy operations and all of the farmland it takes to feed the cows. China? Bottom line is it's not good for the smaller dairies or Morris

Ann Williams **Letter 1057**

As a citizen of Morris, I tried to attend the public meeting this past Tuesday and was denied entry because the space had reached capacity. I am strongly against allowing this expansion. I have read articles about the depleted water wells in other states which allowed dairy expansions. The water use is not sustainable. What happens to all the bull calves born? I have watched video of them being shot dead and dumped like garbage. My husband and I operated a family run dairy in Kandiyohi County in the early 80"s. Cows are not units, but living creatures. Riverview run by Apostolic Christians is run by greed and little regard for nature or other people. Please deny this expansion.

Greg Solberg **Letter 1058**

Hi, I can't even come close to imagining the State would allow this proposal to go through without having an environmental impact statement in place. At what point does health (planet, human, animal, etc) come before profits? At what point does the State mandate corporations own their actions? Meaning, they're on the hook for cleaning up the pollution they create that allows them to earn massive profits - not us taxpayers?

Regards,

Greg Solberg

Carrie Slater Duffy **Letter 1059**

Please do a complete Environmental Impact Statement for Riverview's proposed expansion of West River Dairy. A proposed project of this size (the biggest in Minnesota) demands it. Big Ag can and should be held accountable for impacts on Minnesota's water and climate, which directly effects the health and well-being of Minnesotans.

Rebecca Tryon **Letter 1060**

The West River Dairy Expansion should be required to complete an Environmental Impact Statement prior to being considered for approval. Such an expansion would increase greenhouse gas emission and increase water pollution while we are in the midst of a climate crisis. Such harms should be quantified to weigh against our state's stated emissions and environmental protection goals prior to considering the project for approval. Further, as our state is, in collaboration with neighboring states and nations, the steward of a significant portion of the fresh water available to the world to help weather this expanding environmental crisis, we should not move hastily to approve a massive expansion of animal agriculture without fully considering the ramifications to fresh water in our state.

Tom Rosen, Rosen's Diversified, Inc. **Letter 1061**

c/o Charles Peterson

Rosen's Diversified, Inc. is a Minnesota-based, family-owned agribusiness with operations spanning food processing, livestock procurement, and related agricultural services across Minnesota and the Upper Midwest. We have worked closely with Riverview, LLP and its affiliated operations for many years and submit these comments based on our direct experience with them and Minnesota's broader agricultural economy.

The proposed West River Dairy expansion represents the type of well-planned investment that strengthens Minnesota agriculture and rural communities. Dairy farms like West River Dairy play a critical role in sustaining a broad agricultural ecosystem that includes farmers and ranchers, feed suppliers, and food processors. Expansions of this nature create jobs, support local businesses, and provide dependable demand for crops and livestock grown by Minnesota producers. These investments help anchor economic activity in rural areas and reinforce Minnesota's position as a national leader in agricultural production.

Based on our first-hand experience, West River Dairy is a professionally managed and highly reputable operator. The proposed expansion reflects continued long-term planning and operational discipline that is necessary for agricultural businesses to remain competitive in a challenging economic environment.

Projects like this help maintain a resilient, integrated agricultural supply chain that benefits producers, processors, and communities alike.

We understand that the expansion has been developed within Minnesota's comprehensive environmental and regulatory framework. The project will operate under an Individual NPDES Feedlot Permit, which involves site-specific requirements and enhanced regulatory oversight. The Environmental Assessment Worksheet prepared for the project reflects a thorough review of potential impacts to water, air, land use, and nearby resources, consistent with Minnesota's established environmental review process.

In addition, project materials indicate that the facility incorporates design features intended to manage water responsibly, including capturing and reusing stormwater to reduce groundwater demand. This approach reflects a commitment to environmental stewardship and demonstrates that modern dairy operations can continue to grow while managing resources efficiently.

For these reasons, Rosen's Diversified supports the West River Dairy expansion. We believe the EAW provides a sufficient basis for decision-making and respectfully request that the MPCA conclude the environmental review process and proceed with permitting.

Sincerely,

Tom Rosen

Chair & Chief Executive Officer Rosen's Diversified, Inc.

Nancy Hinrichs **Letter 1062**

This kind of farming is bad for the environment. It is bad for small farms. It is bad for the livestock. It is bad enough this "farm" exists as is. It should not be allowed to increase in size. It should be shut down@

Jerry Nohl **Letter 1063**

I support the West River Dairy Expansion project. I feel an EIS is not needed.

Kayla Parkin **Letter 1064**

I strongly oppose the proposed Riverview Dairy Farm expansion.

This area of Minnesota is where I grew up and many members of my family still live here.

Watching our rural communities be increasingly taken over by large corporate operations with little regard for local residents is deeply disheartening. These decisions are not abstract—they directly affect the health, safety, and quality of life of the people who call this place home.

The scale of this expansion raises serious concerns about pollution, excessive water usage, and long-term damage to the surrounding land, waterways, and ecosystems. These impacts don't disappear once permits are approved, they remain with local communities for generations. Profit should never come at the expense of clean water, clean air, or a healthy environment.

Before any expansion moves forward, there must be comprehensive, independent environmental testing and transparent reporting so the public can clearly see the factual impacts for themselves. Communities deserve real data, not assumptions or reassurances, when the stakes are this high. I urge decision-makers to slow this process down, listen to the people who live here, and reconsider whether this expansion truly aligns with Minnesota's values of environmental stewardship and community

well-being. Please do the right thing...not just for corporate interests, but for the families, land, and future of this area.

Linus Meyer **Letter 1065**

It is not a good idea to concentrate all of these nutrients from mass storage in one location. Sooner or later a huge spillage will occur and pollute an entire watershed. The livestock and manure need to be spread out over numerous counties.

Robert Schlobohm **Letter 1066**

May I suggest that you look at other options for dealing with the waste. I have friends that live in upstate New York and run a dairy farm. They covert all of their waste to methane gas and literally produce all the power that they need to run the operation. That seems to me a better alternative than trying to spread all the waste on adjacent farmland. Maybe a combination of the two options would be better. If you would like the names of my friends in New York I would provide that with their permission.

MNDNR (Nathan Kestner) **Letter 1067**

MN DNR's March 17 comment letter had stated that the EAW did not consider impacts from the potential groundwater appropriation on the Pomme de Terre River. That comment was inaccurate as written - the EAW does describe potential interactions between groundwater appropriation and the Pomme de Terre River in Sections 12.B.3 and 12.B.4, including discussion of pumping restrictions intended to reduce impacts.

MN DNR's March 17 comment was intended to clarify that:

-Available aquifer test data (NRG, 2007) indicate that pumping from well 740629 is hydraulically connected to the Pomme de Terre River, and that a portion of pumped water is derived from induced infiltration or reduced baseflow to the river.

-As a result, groundwater appropriation at this location has the potential to impact river flow, particularly during lower flow conditions, depending on pumping rates and duration.

MN DNR is currently completing an updated evaluation of flow conditions in the Pomme de Terre River. This analysis will inform any permit conditions associated with application 2025-1502.

Consistent with Minnesota Statutes and prior DNR guidance (MN DNR, 2016), any issued permit would include conditions designed to prevent negative impacts to the river, particularly during low-flow periods.

Jill Holslin **Letter 1068**

I'm writing to urge MPCA to conduct a rigorous Environmental Impact Study on the proposed expansion of Riverview in Stevens County, Minnesota. I grew up in Chokio and Morris, and my children (now adults) grew up spending their summers on the family farm north of Alberta. The family is still farming there—the fifth generation to work that land. We love the beauty of the local lakes and sloughs, the natural areas that still remain, and the thrill of seeing pheasants and deer along the road. We do and will always consider Stevens County our home. The expansion of Riverview threatens the local watershed, the wildlife and integrity of this fragile ecosystem. It also threatens to push out local small farmers who are struggling enough as it is. Please protect the integrity of Minnesota's rural communities and study this project before it is too late.

Thank you, Jill Holslin

Sonja Trom Eayrs **Letter 1069**

It's imperative for the MPCA to hold a public meeting that will accommodate all attendees.

I understand that industry boys packed the public meeting on April 28, 2026, while local residents who are impacted by this large operation were turned away at the door and unable to voice their concerns. This is standard protocol for the industry, as the industry historically packs public meetings with industry folks. This is part of the corporate playbook as discussed in my book, Dodge County, Incorporated: Big Ag and the Undoing of Rural America. Https://www.sonjatromeayrs.com/

Nearly 25 years ago, a large dairy operation was proposed just a few miles north of our farm in Dodge County, Minnesota. The dairy operation would've been the largest dairy operation in the State of Minnesota at the time. The fight continued for several years. One evening, the meeting was moved to the old Claremont High School. The township residents showed up at the old high school and were surprised to see nearly 200 folding chairs occupied by corporate executives, including Land O' Lakes, Monsanto, Hormel, Cargill, and other companies. Corporate theatre at its best. There were insufficient chairs for the township residents. Although the township residents were blindsided that evening, they nonetheless remained vigilant and were eventually successful.

Today, rather than send corporate executives to meetings, the industry sends insiders. Several years ago, we went door-to-door in my home Township. We asked residents to sign a petition calling for a special meeting, so we could put local planning and zoning in place and stop the proliferation of factory farms, as our family farm is surrounded by 12 swine factory farms, housing an estimated 30,000 hogs in a 3-mile radius. While dozens of residents signed the petition and called for a special meeting, they were blindsided the night of the special meeting. As local residents showed up at the special meeting, they were surprised that the road grader and other equipment had been backed out of the building. The equipment area was converted to a meeting room, and at least 200 chairs were occupied by members of the hog industry, undoubtedly members of the Minnesota Pork Producers Association (MPPA). A corporate rally.

If the MPCA is going to conduct a public meeting and take public comments from all concerned citizens, the MPCA needs to hold a public meeting in a larger space that will accommodate residents and allow them an opportunity to voice their concerns. It is also essential that the MPCA require that those attending the public meeting sign in to the meeting and provide their contact information.

For more information, see Dodge County, Incorporated: Big Ag and the Undoing of Rural America. https://sonjatromeayrs.com/

Philip Strelow **Letter 1070**

Dear Mr. Peterson,

My name is Philip Strelow, and I am the employee and operator of Strelow Ranch Trucking. Our business works with agricultural operations in Nebraska, including Riverview, and I am writing in support of the proposed West River Dairy expansion in Stevens County.

A strong agricultural economy depends on reliable livestock operations. Companies like Riverview help sustain that strength by creating consistent demand for services, supporting local employment, and contributing to the overall economic health of rural communities.

The proposed expansion will bring clear economic benefits to the region. It will support local vendors and contractors, create both construction and long-term jobs, and reinforce the stability of communities that rely heavily on agriculture.

In our experience, Riverview has proven to be a dependable and professional partner. Their operations contribute positively to the areas where they are located and support a wide network of agricultural and service-related businesses.

Projects like this are vital to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture helps ensure that businesses like ours can continue to operate, grow, and provide essential services.

Considering the thorough and rigorous nature of the state's environmental review process, I do not believe an Environmental Impact Statement is necessary for this project. I respectfully encourage your support and approval of this expansion.

Sincerely,

Philip Strelow

John Fisher-Merritt **Letter 1071**

Dear MPCA,

I am a farmer in Wrenshall, MN. I am not a dairy farmer, but my friends who are dairy farmers are struggling to make ends meet. The West River dairy expansion will not only threaten soil and water quality in Stevens County, but will also put downward pressure on the price my neighbors receive for their milk.

John Fisher-Merritt

Ricardo Camargo **Letter 1072**

I support the west river expansion

Jennifer Maleitzke, RDO Equipment Co. **Letter 1073**

Dear Mr. Peterson,

I am writing on behalf of RDO Equipment Co., which supports construction and agricultural operations throughout Minnesota, including dairy producers such as Riverview, LLP. We appreciate the opportunity to comment on the Environmental Assessment Worksheet (EAW) prepared for the proposed West River Dairy expansion in Stevens County.

We have reviewed the EAW and note that it addresses the subject matters required under Minnesota's environmental review statutes and rules, including groundwater and surface water considerations, manure management, air quality, traffic, and other environmental topics within the scope of an EAW. The document also identifies regulatory mechanisms that would apply to the project through existing state and local permitting processes.

At this stage, we believe the information developed through the EAW provides a sufficient foundation for the project to move forward into the permitting phase, where the identified mitigation measures and operational requirements can be fully evaluated, refined, and enforced by the appropriate regulatory agencies. Proceeding through the established permitting process is consistent with state statute and allows for continued agency review, public input, and regulatory oversight.

For these reasons, we respectfully encourage the MPCA to follow the state's existing environmental review and permitting processes and allow the proposed project to proceed through those channels.

Thank you for your consideration.

Jennifer Maleitzke

Director of Communications and External Affairs

R.D. Offutt Company

Cathy Solvie **Letter 1074**

Hello, I think you need to have several more of these conversations with the affected community before an MASSIVE expansion and drain on our water happens. It can't always be about the money. You all have more than enough to get you and generations of your families taken care of. This is all unnecessary. Think about the environment and the people you reside around first please.

Nathan Hrnicek **Letter 1075**

I. Introduction and Basis for Comment

I am submitting these comments in strong support of the proposed West River Dairy Expansion in Stevens County, Minnesota. I offer this testimony as both a longstanding business partner of Riverview, LLP and as a dairy industry professional with extensive firsthand experience in nutrient management, advanced manure separation technology, and precision nutrient application systems across Minnesota and the broader Upper Midwest.

NutraDrip works directly with Riverview's operation as a trusted technology and agronomy partner. That working relationship has given me direct, sustained visibility into how this organization approaches environmental stewardship, nutrient management planning, and responsible growth. I do not submit these comments as a formality. I submit them because I have seen, firsthand, the operational discipline and environmental commitment that Riverview brings to everything they build — and I believe the proposed expansion to a combined 18,855 milking cows (26,397 AU) at West River Dairy represents exactly the kind of modern, accountable agricultural investment that Minnesota should be supporting.

II. The EAW Accurately Reflects a Well-Managed Operation

The Environmental Assessment Worksheet is an information-gathering tool — and the information it should reflect is this: Riverview, LLP has demonstrated, over years of operation, that large-scale dairy farming and responsible environmental stewardship are not in conflict. They are, in Riverview's case, inseparable.

The proposed expansion builds on an existing facility with established infrastructure, permitting history, and nutrient management systems already operating at scale. This is not a greenfield operation with untested management. Decision-makers reviewing this EAW should weigh heavily that the proposer has a proven track record managing one of Minnesota's most significant dairy operations — and has consistently done so in compliance with state environmental requirements.

III. Nutrient Management: Infrastructure and Technology That Match the Scale

The most consequential environmental consideration in any Animal Unit expansion is the management of increased manure volumes and the associated potential impacts on surface water, groundwater, and air quality. Based on my direct knowledge of Riverview's approach and systems, I am confident the

proposed expansion can be managed without significant adverse environmental impact — provided the nutrient management infrastructure in place is accurately represented and enforced through permitting.

I would highlight the following specific strengths:

Advanced Manure Separation Systems

Riverview utilizes manure separation technology that meaningfully reduces the volume of liquid effluent requiring lagoon storage and land application, while concentrating nutrients into manageable solid fractions. At the scale of 26,397 AU, this is not a minor operational detail — it is a foundational risk-mitigation tool. Separation substantially lowers the risk profile for nutrient runoff, lagoon overflow, and excess loading to application fields. It also enables far more precise nutrient application by separating the liquid and solid fractions so each can be managed according to actual crop and soil need.

Precision Nutrient Application

As a partner in subsurface drip fertigation and precision nutrient delivery systems, I can speak directly to the practical and environmental advantage of applying separated manure fractions through controlled, metered application systems. This approach dramatically reduces surface phosphorus and nitrogen loading, minimizes ammonia volatilization losses, and ensures that nutrients are placed where growing crops can utilize them efficiently — keeping them out of drainage tile outlets, ditches, and waterways. These are not theoretical benefits; they are measurable outcomes that distinguish operations like Riverview from legacy dairy operations that opponents of large dairy farms often reference.

Nutrient Management Planning (NMP) at Scale

Operations of this size in Minnesota operate under NPDES/SDS feedlot permits that require rigorous, maintained Nutrient Management Plans. Riverview's operational scale means their NMP is actively managed by professionals — nutrient management specialists, certified planners, and environmental consultants — not simply filed and forgotten. The land base required to support 26,397 AU under Minnesota's nutrient application standards is significant, and Riverview's history demonstrates they have assembled and managed that land base responsibly.

IV. Water Resource Protection

The EAW process rightly scrutinizes potential impacts to both surface water and groundwater resources. I offer the following observations based on industry expertise and operational familiarity:

Manure separation systems reduce hydraulic loading on lagoon infrastructure, lowering overflow risk during high-precipitation events — one of the most common pathways for nutrient impairment of surface water.

Precision subsurface application methods effectively eliminate the surface runoff pathways that would otherwise convey nitrogen and phosphorus to drainage ditches or surface water bodies. Stevens County's agricultural soils and land base, when managed under a properly maintained NMP calibrated to realistic crop uptake and existing soil phosphorus indices, are well-suited to receive the nutrient outputs of an operation at this scale.

The expansion of an existing, permitted facility — rather than establishment of a new operation in an unpermitted location — provides regulators with an established baseline for monitoring, inspection, and enforcement.

I would encourage decision-makers and the RGU to ensure that the EAW reflects the specific separation, storage, and application technologies in use, as these are material factors in assessing actual environmental risk — and they distinguish this project favorably from generic large-feedlot assessments.

V. Economic and Community Context

While the EAW is an environmental review document, the decision-makers who rely on it should understand the full context of what is being proposed. West River Dairy and the Riverview family of operations are not simply large agricultural businesses — they are anchors of the Stevens County rural economy and examples of how agricultural investment, when done responsibly, sustains the communities, supply chains, and skilled workforces that rural Minnesota depends on.

Operations like Riverview create and sustain jobs in veterinary services, equipment, trucking, feed, agronomy, and processing. They support local tax bases. And they demonstrate that Minnesota can remain competitive in dairy production without sacrificing environmental standards — a balance that matters enormously to the long-term viability of agricultural communities across the state.

VI. Conclusion and Recommendation

Based on my direct professional experience with Riverview, LLP's operations and my expertise in nutrient management and the dairy industry, I submit the following conclusions for the record:

The EAW adequately describes a project that can be permitted without significant adverse environmental impact, provided the nutrient management, manure handling, and land application systems described are accurately represented and enforced through the permitting process. A full Environmental Impact Statement (EIS) is not warranted. The proposed expansion builds on an established, permitted, professionally managed facility with documented environmental compliance. The incremental increase in AU, when managed through Riverview's existing infrastructure and nutrient management framework, does not present the level of environmental uncertainty that would require an EIS.

Approval of this expansion supports Minnesota's agricultural economy and demonstrates that responsible large-scale dairy farming is achievable. I encourage the relevant agencies to move this project forward expeditiously.

I appreciate the opportunity to provide comment and am available to discuss any aspect of this letter in greater detail.

Respectfully submitted,

Nathan Hrnicek

Director of Sales

NutraDrip

Reyna Estrada **Letter 1076**

How can there be a guarantee that the cows well being won't be jeopardized for profit? Also,the water amount proposed to be used is extremely high and shouldn't be allowed.

Tyler Bueng **Letter 1077**

I personally live 15 miles away from the Waukon Dairy that Riverview operates in Norman County. Myself and my family have all toured their facility. I also have professionally been out there to work on repairs through my employer. So I've had a large sample size of how Riverview operates during their daily operations! I can say confidently they have the cleanest and most efficient operating dairy around. Not only do they set the standard for an outstanding dairy operation, I'd honestly say they are the standard! I also would like to mention how well they support the local communities that surround their

operations. They make a positive impact from top to bottom within their organization. Riverview is helping keep creamery's in Minnesota full and operational, they create job opportunities, give local farmers another market to sell their commodities to, tax revenue for counties and townships, bringing families to these small communities that boost population and put more kids in our schools, and support local businesses with buying supplies and materials locally. The list goes on and on! I also think if there was an negative environmental impact Riverview would go above and beyond to try and fix the situation and improve going forward. Let them expand and continue being a positive impact on the dairy industry!

Josie Hollermann **Letter 1078**

Hi, my name is Josie Hollermann. I am 15 years old and have lived about 1,000 feet from one of Riverview's dairies, and even closer to the covered manure tank. From my experience living this close, the smell of manure has never been so horrible that I couldn't go outside or enjoy the location I live at. I think projects like these help cultivate future opportunities for kids like me. Expanding Riverview will create more job opportunities for the community.

For these reasons I support this expansion project.

Josie

Suzanne Swanson **Letter 1079**

I am writing with deep concern for the potential establishment by Riverview LLP of the industrial-scale livestock facility near Morris, Minnesota. This project's scale requires that the MCPA give greater scrutiny than it ever has to previous proposals. This proposal by Riverview must be required to undergo a full environmental impact statement (EIS).

No feedlot has ever undergone an environmental impact statement (EIS) process in Minnesota. Each time the MPCA has determined that an operation should undergo one, the operator that requested the permit has withdrawn their application. And all of those operations that were determined to need an EIS were significantly smaller than Riverview's current proposed operation will be.

If built, the Riverview operation would be allowed to pump up to 226 million gallons of water per year from an off-site well. For reference, the City of Morris, which is home to over 5,000 people, is permitted to pump up to 300 million gallons of water a year. Once constructed, the facility would produce 202,744,000 gallons of liquid manure and wastewater a year and 26,400 tons of solid manure a year.

The Pomme de Terre watershed, where this expansion is proposed, is already considered a sensitive watershed. The MPCA already lists the two closest waterways to the facility, the Pomme de Terre River and an unnamed creek, as impaired, and this proposal would only exacerbate the impairment.

I no longer live in Western Minnesota, but I grew up in that part of the state. The small town where I grew up is struggling as small farmers try to deal with the challenges of corporate ag. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

The MPCA is charged with assessing the environmental impact of proposed projects, protecting the safety of Minnesota residents. Again, this proposal by Riverview must be required to undergo a full environmental impact statement (EIS).

Athena Kildegaard **Letter 1080**

Please consider the following questions regarding the expansion of West River Dairy.

• Has the dairy sufficiently accounted for increasing incidence of 25-year 24-hour precipitation incidents? Has it also adequately accounted for the effects of El Nino and La Nina and the potential consequences for leakage?

• Given that the manure from the cows will be used as fertilizer on fields that will supply alfalfa for the cows, what are the long-term consequences of this closed-circuit consumption? Will the milk degrade in nutritional content? Will the likelihood of health issues increase?

• Furthermore, what will the environmental impact of this alfalfa monoculture be over time on the soil and on the surrounding ecosystem?

• The EAW states that Riverview will "look for signs of discoloration or odor that may indicate an issue with the liner." There appears to be no other method for ascertaining the efficacy of the manure liner. Are "signs of discoloration or odor" sufficient? Are we willing to accept "may" as the terms here? If seams open in the bottom of the liner, will there be surface-level evidence of the leak? If not, how long will it be before anyone notices?

• What will the impact to the public be in more than doubled truck traffic—in road maintenance, traffic noise, CO2 emissions?

• How many family dairy farms will be forced out of business by this expansion?

Peter Dolan **Letter 1081**

My mind would certainly be more at ease about the Riverview dairy expansion if there was an Environmental Impact Statement prepared. I've heard good things about the quality of their dairy farms, but I've also heard bad things about water usage and aquifer depletion. Being locked out of the last public comment session that occurred in Morris, MN because the venue was too small for the public interest definitely made me feel uneasy because it made it seem likely that a representative sampling of concerns and supports couldn't have occurred. To me this reinforces the need for an independent assessment of the potential environmental impacts. I've heard some of the potential benefits for our community from the expansion, but the Pomme de Terre watershed is an important part of our local culture and our local environment, so it only seems fair to have at least a somewhat more comprehensive, independent third-party assessment of the risks.

Mark Satre **Letter 1082**

I live 4 miles as the crow flies, we have noticed our well water smelling due to the saturation of soils with manure. Too many being allowed in Chippewa Co. All our commissioners must think the tax revenue is great, or some under the table deals are being done. Too many in Chippewa Co.

Thanks

Susan Kulberg **Letter 1083**

As Stevens County resident, I believe an EIS is necessary. Without that I am in complete OPPOSITION of the West River expansion

Exal Villalbos **Letter 1084**

I support the West Riverview expansion. No EIS required.

Christian Baez Tellez **Letter 1085**

I support the West Riverview expansion. No EIS required.

Jose A Vasquez **Letter 1086**

I support the project

Victorino Serrato Martinez **Lettter 1087**

I support the West Riverview expansion. No EIS required.

Diego Saldana Morales **Letter 1088**

I like the way they work with the environment; they are very gentle and caring with the animals I support the west Riverview expansion, not EIS required.

J. Cesor Chavez **Letter 1089**

I support the West Riverview expansion, no EIS required.

Luis C. Hernandez **Letter 1090**

I give all my support for the project based on the knowledge and experience of all the people wich is infront No EIS is necessary

Humberto Meyer Fuentes **Letter 1091**

I support the west riverview expansion. No EIS required

Anonymous **Letter 1092**

I support the West Riverview Expansion. No EIS required.

Anonymous **Letter 1093**

I support the West Riverview expansion. No EIS required.

Anonymous **Letter 1094**

I support the West Riverview Expansion

No EIS required.

Marilo Rodriguez **Letter 1095**

I support West River/Riverview expansion

Hugo Gonzalez **Letter 1096**

I support West River/Riverview expansion

No EIS

Jackson Walsh **Letter 1097**

We are a local farm by the swift county dairies

Riverview has been great to work with and I believe their permit should be awarded. They have don good work on following current environmental rules and the eis is not nessecary.

Dustin Walsh **Letter 1098**

My name is Dustin Walsh. I live in Swift County MN. I have been a neighbor to Riverview dairy for over 20 years. I fully support the West River expansion and do not see any need for an EIS to be done.

Jeanne Norrgard **Letter 1099**

West River Dairy wants to more than double its industrial-style dairy operation in Morris, Minnesota, to become the largest indoor dairy feedlot in Minnesota history. West River Dairy has the financial wherewithal for this massive expansion. They have the financial wherewithal to run multiple operation here in Minnesota and in other states. They have the financial wherewithal to complete a thorough Environmental Impact Statement. And yet, West River Dairy doesn't want to complete an Environmental Impact Statement to reassure Minnesotans that this expansion would be safe for our land, our water, our air, our fish and wildlife and our public health. Why not? In the face of that very reticence, the MPCA must stand firm and do the job of pollution control oversight on behalf of the citizens of Minnesota and require West River Dairy to complete a full and thorough Environmental Impact Statement.

Connie Benson **Letter 1100**

My name is Connie Benson. I am a retired teacher living in Wheaton, MN. I am writing this letter in support of Riverview Dairy and I see the benefit this dairy has made in our community. First of all, enrollment in our schools was in decline before the dairy and since the dairy has come to the area it has since stabilized. Now approximately 3-4 students in a class have parents who are employed by the dairy. That alone helps our schools financially and secures employment for our teachers. The employees who have moved into the area very respectful and hard workers. They buy and rent homes, support our businesses, and use our medical facilities. They also support our local churches. They are very much apart of our community.

Riverview has also contributed to several projects in our community. I will list a few:
1.Youth baseball summer field improvements
2.Resurfacing of our high school parking lot
3.Repairs of city duck monument

I'm also friends of a family that lives by the Riverview owned dairy by Dumont, MN. They often remark about how good neighbors the dairy is. In summer when gravel roads are dusty, the keep them watered down to prevent dust, there is little to no oder, and at a good price they can sell their corn and alfalfa to the dairy. They can also provide a good fertilizer for their land if the farmers wish. I'm also a good family friend of a young man employed by Riverview. I have heard many good comments of how well their employees are treated.

So, as I can see, Riverview Dairy is nothing but a win for western Minnesota. Therefore, I am in full support of this Riverview project and no EIS is needed.

Sincerely,
Connie Benson

Marcus Vaqueu **Letter 1101**

We support the expansion for West River. As a worker for a local farm in swift co it serves opportunity myself and others help us to suport our family.

Terri Hawkinson **Letter 1102**

The River View dairy expansion is proposed to be located precisely at the front door of my childhood home. Although we no longer own the farm site, we do own farm land 1 mile south and 3 miles north of the proposed site. My immediate concern was what I considered lack of transparency-it took me multiple inquiries to get an answer on the township and section number for the expansion. Until then, my neighbors and I were thinking: "not in my backyard" therefore doesn't concern me. How wrong were we.

My next thought was a fading memory of "didn't something happen at their Arizona site"? Stevens County Minnesota should not be allowed to be their second disaster case. Lastly my concern is for that possiblity of contamination of the local watershed and drying up underground water sources for my neighbors and possible future residents of our family's land.

Please require all of the appropriate studies of the proposed River View expansion.

Thank you,
Terri Hawkinson

Heriblez n/a **Letter 1103**

I support West River Expansion. No EIS required.

Nathan Compart **Letter 1104**

Minnesota's water goes 3 different dirrections, we are the headwaters for a very large portion of the continent. We NEED to look at regulating CAFO's at smaller numbers than this. It is not up to us to pay the environmental costs as a state so that a few people can use the land to extract wealth. Until we do better with our water No one downstream from us can do better with their's.

Alejandra Anguiano **Letter 1105**

I support the West River Expantion

David Diaz **Letter 1106**

I support the West River Expantion

Adam Koehl **Letter 1107**

I support the West River Dairy expansion.

No EIS is necessary

Ash Rose **Letter 1108**

This operation is a huge threat to our water supply. Unless this dairy can provide sustainable waste product processing, it is an extremely bad idea for Minnesota wildlife and environment.

Kyle Klausing **Letter 1109**

As a former Morris resident, I don't believe this expansion will positively impact local residents or the overall environment of our state. The MPCA should conduct as full a review as possible before moving forward.

Brian Wojtalewicz **Letter 1110**

Fact: some farmers overapply manure, and do not comply with rules on application.

Fact: All manure pits and lagoons leak.

Fact: Local economies get detrimental social and economic results from large livestock concentrations.

Fact: Alleged best management practices of large confinement systems fail, not just in Minnesota but around the USA.

Fact: Manure pits will inevitably overflow, and will be made worse and more frequent with the severe weather events of the climate crisis. Are you unaware of the huge rain event in Stevens county within the last year?

Fact: you would be allowing a huge experiment in aquifer depletion.

Fact: the groundwater in the area would be threatened more than ever before in recorded history.

Fact: even in recorded history, the flooding that can occur is so huge that the waters of both the Pomme de terre and Chippewa rivers united. Ask Mark Seeley, meteorologist.

Fact: huge animal confinement systems in the USA use and misuse antibiotics on a huge scale, three to six times more than European farmers

Fact: you folk reading this and making the decision to allow the equivalent shit of about 250,000 people just upriver of where we live along the southern Pomme de terre river do NOT live there, nor do your children and grandchildren.

Chad Davison **Letter 1111**

My name is Chad Davison and I am a farmer near Riverview's North Ottawa Dairy. I am writing in support of their proposed West River Dairy expansion in Stevens County.

In my experience with Riverview, they are a positive influence within the communities they operate. Their presence opens up new markets and new opportunities to local farmers, which is essential in times when we endure low commodity prices.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,
Chad Davison

Diana Oliwaus **Letter 1112**

I support west river dairy expansion

Lynn Hu **Letter 1113**

I urge Riverview to complete an Environmental Impact Statement before determining whether or not to expand their operations. Citizens have the right to determine the magnitude of how this new feedlot would produce more greenhouse gas emissions, introduce additional water pollutants, and introduce a nuisance onto the land. Agricultural developments should only progress using strong, data-backed evidence that they have measures in place to mitigate these harmful impacts.

Barbara Kill **Letter 1114**

We arrived at the informational meeting last week early, only to be turned away with the explanation that the venue was at capacity. There were many others besides us who were disappointed not to be able to be admitted. We were open to hearing what they had to share, but not being able to hear that only deepens our concerns about this expansion in our community. At the very least, a EAW should be conducted to reassure those who are concerned that everything possible is done to circumvent an environmental disaster that could render the surrounding countryside unusable for years. This is just an enormous amount of animals concentrated in far too small an area. I also am deeply concerned that so many smaller family farms will be driven out of business by the massive corporate farms who control a monopoly on the industry.

Brenda Boever **Letter 1115**

To those who are listening,

Rural communities are struggling and fighting for their lives. It takes all of the individual family farms and those in small towns to work together to create a thriving community. Corporate farms have a different agenda. They hold the money and power and push out those who stand in their way. That's not what a good neighbor looks like.

We lived in Morris for over 4o years until just last year. I've seen the local economy change due to those who have this money and power. Main street Morris doesn't come close to resembling the thriving independent business community that we enjoyed in the 1980's and beyond. This corporate money has changed the local economy and has reduced the business climate to one that responds only to those associated with RiverView Dairy - those who have money and power. Sadly, Morris and Stevens County has become a one-note town. It's the primary reason we moved.

The environmental impact on this project is a potential disaster! The Pomme deTerre river shed isn't healthy now, and one "mishap" could be catastrophic. Please require an environmental impact study. This company has a record of not doing their "homework", then withdrawing projects when they are questioned.

Just because you "can" do something like build a giant dairy, doesn't make it a good idea. There are lots of communities like Morris that are struggling for their economic vitality. Corporations like RiverView are not people and they don't make community. Rural America needs neighbors they can count on.

Please stop this absurd project. Thanks for your consideration, Brenda Boever

Shawna Conroy **Letter 1116**

Please require a full wnvironmental review. It is imperative that Minnesota's groundwater be protected. The high concentration of animals and heavy use will likely draw down the aquifer.

Barbara Hyk-Zimmer **Letter 1117**

Corporate farming is horrible. It's horrible for the animals which in turn means horrible for those drinking and eating dairy. Horrible for the environment. PERIOD! We either pay for healthy cows to supply us with healthy dairy products or we pay at the doctors when we are sick. As a 2x cancer survivor I want sustainable (organic) farming practices, which lead to healthy produce, as well as lifestock. That IS the opposite of Corporate farming.

We need to save the small family farms.

Nelson Jorgenson **Letter 1118**

I attended the Public Meeting held by you last week in Morris, MN. I observed that the cloud was very polite and respectful; I was very pleased by that. The majority of the comments came from what appeared to be a well-organized effort by Riverview to pack the room with employees, and most comments were clearly scripted by Riverview to support the expansion. Those against the expansion, therefore, were outnumbered, and the comments were not scripted. The most meaningful objections concerned the threat to water quality and quantity, and the statement made by former MPCA staff that the existing regulations are not strict enough to protect the environment.

I was too unprepared and nervous about speaking in public that I did not speak. But I would like to emphasize several key problems with the expansion:

1) **As proposed this would be the largest dairy farm ever in the state, which of course should trigger the maximum review available, up to and including an EIS. If you don't use an EIS for the largest farm, you would be negligent in your oversight responsibility.**
2) **Approximately 2/3 of the waters in Minnesota are polluted. Water scarcity and pollution are a huge problem world-wide; and all water everywhere needs to be better-protected as climate change, overpopulation, and higher concentration of industrial scale water use occurs.**
3) **Lastly the scale of this dairy farm means there is a higher risk of disaster, pollution, or diminishment of the water in the county. I beg you to require an EIS for this project.**

Thank you.

Herbert Davis **Letter 1119**

As a rural resident with no connection to dairy producers, I'm offering my opinion as a dairy consumer and a tax payer.

I oppose the ever larger corporate model of dairy farming because it will hurt the environment and reduce rural economies.

Some of the existing dairy operations are already too large from a water pollution perspective.

Stop the ever increasing consolidation, it seems it has gone too far and needs to stop!

Billy X Curmano **Letter 1120**

I do not believe it is in the environment or the Minnesota citizens best interest to allow a mega-dairy operation. It will compete with existing family farms and increase pollution. The only benefit would be to the corporate factory farm.

Kay Slama **Letter 1121**

The West River Dairy Expansion is too risky to approve--risky for our environment, bad for smaller dairy farmers, and likely to give the West River Dairy owners too much control over milk prices. An EAW is not adequate for such a huge expansion--we need an EIS to fully examine it and allow for greater citizen input.

Susan Scherer **Letter 1122**

Having grown up near a central Minnesota town (Long Prairie), which had a creamery, a locker plant, a meat market, supplied by local small dairy and beef farms, I am full of appreciation for those resources. My classmates were from those farms, so " town kids" and "farm kids" knew each other and we all understood the value of our parents' livelihoods, whether they were farmers or community employees. It was a balanced economy with cooperation and understanding of everyone's part in making it successful. We all cared!

Distance and size have removed much of that understanding, and reduced the businesses that made this kind of cooperation successful and gratifying. I believe that those mental and physical health benefits lost of personally knowing and understanding the value of small, caring communities has led to more violence, more mental illness, more isolation, while large corporations have made profit their sole goal, while caring nothing for the community. It does not add to a democratic, caring society, and we're seeing the effects at all levels of government and business.

Thank you Attorney General Ellison for listening to this eloquent plea from a small farm owner.

Sincerely,
Susan Scherer

Diane Baum **Letter 1123**

I am a Morris resident who has been in contact with the residents of Willcox, AZ, home to another Riverview project. They are concerned by Riverview's out of control style of land takeover, of draining their water and more. I feel this is a picture into the future of Morris, MN as well. This MUST be stopped, which is why I am asking for an EIS OR, an outright denial of this planned expansion altogether. As one Dakota Sioux woman said, "water is life, all of nature is life. If we don't preserve it for our next generations, who will?"

Ferolyn Angell **Letter 1124**

My name is Ferolyn Angell, an educator, small business owner and Pomme de Terre Foods board member. I have lived in West Central MN (Pope & Stevens Counties) for the past 42 years.

I have now read through 400 + comments regarding the West River Dairy expansion. While a good many comments are repetitive either in favor of the expansion or against it, the number of comments requesting an EIS, as well as in opposition to CAFOs in general, far out number those in favor of expansion (390 – 83 at last count and yes, I kept a tally of the comments I have read). It is also worth noting that more than half of those in favor of expansion are either employed by or business partners with Riverwood, the parent company.

I found substantial concerns and ideas expressed that I would like to bring to your attention.

The comments submitted by Mr. Kestner from the DNR on 3/17/26 regarding wells, aquifer replenishment, and river flow raise concerns about monitoring of aquifers and the need for benchmarks to be established for water tables and contaminants in the Pomme de Terre river and surrounding watershed.

Sensitive areas (marshlands, creeks, ditches) for water fowl, migratory birds, etc. may be at risk. Depletion and contamination of water resources and habitat is of concern.

Although a good argument is made for decreased use of chemical fertilizers by spreading manure, it seems that the impact of increased methane, ammonia, hydrogen sulfide, the release of anti-pathogenic chemicals (antibiotics, hormones, etc) into the air and ground have been overlooked.

There is also concern about how the guidelines for manure spreading are enforced when it is being done by outside partners on fields that are not controlled by the permit seeker.

The current EAW as it was presented on 3/28/26 does not address the impact of the proposed expansion on the marketing of milk and milk products, price impact and the effects on smaller dairy farmers.

The increased risk of disease transmission among the animals is also a concern expressed by many of the comments. The presence of dust and insect pests (a good way to transmit pathogens) is mentioned by nearby neighbors.

The call for an Environmental Impact Statement was repeated often in the comments because it would address the effects of the proposed expansion beyond the operations of the milking facility. The project has far reaching implications that go beyond the immediate area surrounding the site of the West River Dairy. Some of the comments made by people in other parts of Minnesota and even other states point this out.

Up to this point, MPCA has not required an environmental impact for a 'feed lot' of this type. Since this permit would be for the largest milk production operation housing a herd of previously untried size, environmental impact is extremely broad and a review is vital for future health and safety.

I am personally concerned about the tremendously shortened life span of the cows that are subjected to the milking operations in factory dairy production. The dead or dying cows are either rendered or slaughtered for consumption. In some cases, I believe they are buried in pits.

At the public meeting held by MPCA in Morris on April 28th many local farmers and area residents were turned away at the door because the room was at capacity. Therefore the purpose of the meeting - to provide an opportunity for residents to voice concerns and ask questions - was not achieved. This will require another meeting in a larger capacity venue. It is now planting season so scheduling a time when farmers can participate is crucial.

Given the changes in climate and the growing number of extreme weather events, many are concerned about the prudence of relying on currently available rainfall data. Changes in weather patterns will impact the likelihood of manure spills in the future. Minnesota's stated climate targets must also be kept in mind in reviewing this expansion.

In my estimation, an EIS is the best next step for this proposal. I am happy to share my list of substantive comments pro and con if that would be helpful in wading through the more than 1100 submitted so far.

Em Senten **Letter 1125**

This expanded Riverview facility would be the first of its size in Minnesota, and more than 60 times the size of the average Minnesota dairy (fewer than 280 cows in 2025). This makes it a fundamentally new and particularly powerful threat to Minnesota farmers and rural communities.

The MPCA must recognize the fundamentally new nature of this threat and give this permit greater scrutiny than it ever has to previous proposals. This proposal by Riverview, LLP must be required to undergo a full Environmental Impact Statement.

An EIS will allow the proposal's negative impacts on water quality and quantity, local roads, and existing independent family dairy farms to be fully analyzed before the project is allowed to seek a permit.

Riverview has a recent history of manure spills in western Minnesota. In Arizona, the company recently agreed to pay $11 million to residents affected by the dairy's overpumping. The proposed Stevens County site sits within five miles of eight different protected waterfowl and wildlife production areas and is part of the Pomme de Terre River watershed, just 25 miles from its confluence with the Minnesota River. A facility of this scale located in such a vulnerable area calls for a thorough environmental review.

Just as importantly, an EIS of the West River Dairy Expansion proposal would address socio-economic impacts. Minnesota is already losing dozens of dairy farms annually due to inconsistent and often below cost-of-production milk prices. Massive dairy operations, like the one Riverview is proposing to build, have glutted the market and tightened Big Milk's stranglehold on the industry, allowing them to push small and medium-sized family farms out of business and off the land. This operation would only exacerbate the situation and accelerate the loss of dairy farms in our state, decimating Main Street economies in the process.

An industrial scale project needs industrial scale review. We need to make sure efforts to grow our economy are accountable to and support our farmers, our land, and our communities.

Lori Hinrichsen **Letter 1126**

Water depletion could impact surrounding consumers. The concentration of manure, if not managed properly, could lead to an environmental disaster. Diversification of locations and smaller dairy farms would be the most environmentally sustainable solution.

Tommy Houdek, Wild Rice Electric Cooperative, Inc. **Letter 1127**

ATTN: Charles Peterson

My name is Tommy Houdek, and I am the Director of Member Services & Communications with Wild Rice Electric Cooperative, Inc. I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

Our experience working with Riverview Dairy has been overwhelmingly positive. They have proven to be a reliable and professional partner, contributing meaningfully to the communities they operate in. From an economic standpoint, their operations provide stable, long-term benefits by supporting local jobs, driving investment, and creating opportunities for surrounding businesses.

In addition to their economic impact, Riverview represents a consistent and dependable presence from an energy perspective. As a strong and stable electric load, their operations contribute to the overall efficiency and sustainability of the local electric system, which benefits the broader membership and infrastructure.

Riverview has demonstrated a commitment to maintaining strong working relationships and operating responsibly within the communities they serve. Their willingness to collaborate and invest locally makes them a valuable partner and an important contributor to rural vitality.

The proposed expansion will build on these strengths, supporting additional economic activity, creating jobs, and reinforcing the agricultural backbone that so many rural communities depend on.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

I respectfully encourage your support and approval of this project.

Sincerely,
Tommy Houdek
Director of Member Services & Communications
Wild Rice Electric Cooperative, Inc.

Robert Dana **Letter 1128**

I urge you to require a full environmental impact review of this project. There should also be a requirement for a social impact review as well.

Ismad Cruz **Letter 1129**

I support west River Dairy expansion.

No EIS needed.

Jason Yoss **Letter 1130**

ATTN: Charles Peterson

My name is Jason, and I am the owner/operator/employee of YB Truckin, I provide a rendering service to Minnesota farms like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,

Jason

Julie Kill **Letter 1131**

While reviewing the documentation for Expansion and permitting, several issues came to mind.

First of all- Why is the data for the pump test almost 20 years old? It seems to me that a new pump test should be completed to ensure that the aquifer in questions can handle the amount of water that the offsite well is supposed to be providing. Normally, a pump test should be required in any circumstance where an increase in water use is requested, would it not? Why is the nearly 20 year old data being allowed?

Second- I know of neighbors who had to have new wells drilled when the first ~7000 cows were permitted.

Has the cone of depression around the Onsite wells even been studied? Has this been completed since the First part of the Dairy began using the water? Have water levels been monitored at all in the neighbors wells? Is there data available for the 8 wells that riverview has on site as well as pump testing for those wells? What about monitoring for water usage?

Adding over 11,000 animals units is not going to help the aquifers where these 8 wells are located either. Have studies been done on the increased water that will be drawn from the on-site wells? Three of the 8 Riverview onsite wells are at between 136(a2) and 141 feet in depth. Well H and Well B are 164,166 feet deep. The other wells onsite are screened at nearly 300 feet. How many different aqufers are involved? What is know about them? To the best of my knowledge the aquifers in this area of Minnesota have not been well studied. If these aquifers are further drawn down with the increase in the number of animals, Where is the water supposed to come from? The Dairy will have a storage tank. What will the neighbors have?

Is the Dairy tapping into the Souix aquifer/ or a section of the Sioux Aquifer (which is the largest aquifer in this region of the United States)? What will happen if it is connected to the Sioux Aquifer? A free for all?

Third: According to the capacity levels for the holding areas the total number of animals on site should be 7856. The actual number of animals onsite is 10995!!!!! According to the NPDES PERMIT. THREE THOUSAND ONE HUNDRED THRITY NINE OVER THE CAPACITY! OVER CAPACITY!!!!! NOW. What is going to Happen if they get the go ahead to expand? 50,000 animals?????? EXPAND ALL OF THE OTHER DAIRYS? This is NOT Acceptable!

Fourth: Using earthen barriers in the holding areas for manure. What will be put into place for monitoring them to make certain that they do not leak, burst, overflow? What is the PROVEN life of holding areas like these?

Fifth- packing the house for the meeting is not acceptable either. Many people were turned away who had questions and concerns and as Minnesotans, We have that right to ask them and to have them answered by the MPCA. I would lke to request another meeting! This is not Just, Moral or fair to all.

People Want an EIS for this site and an EIS Should be required for this site.

Please make your decisions with the future of All of us in mind, and our Children and Their Children. Make Certain. that this area is kept safe and the waters and ecosystems are kept healthy for those coming after us.

Thank you for your time.

Janine Wojtalewicz **Letter 1132**

RE: West River Dairy

Below are several factors that my family, who lives in rural Minnesota near the Pomme de Terre River, is aware of concerning how expansion of the West River Dairy would negatively affect this river and the rural environment surrounding it.

*It is well known that some farmers over apply manure, and do not comply with rules on application.

*All manure pits and lagoons leak.

*Local economies get detrimental social and economic results from large livestock concentrations.

*Our health and the health of area wildlife and creatures living in the river are all impacted, as well as our enjoyment of outdoor activities such as canoeing and kayaking in this river, swimming, fishing and holding family gatherings centered around the beauty of the river.

*Alleged best management practices of large confinement systems fail, not just in Minnesota but around the USA.

*Manure pits will inevitably overflow and will be made worse and more frequent with the severe weather events of the climate crisis.

*This expansion would be allowing a huge experiment in aquifer depletion.

*The groundwater in the area would be threatened more than ever before in recorded history.

*Even in recorded history, the flooding that can occur is so huge that the waters of both the Pomme de Terre and nearby Chippewa rivers united. This has been verified by meteorologist, Mark Seeley.

*Huge animal confinement systems in the USA use and misuse antibiotics on a huge scale, three to six times more than European farmers.

*Those of you reading this and making the decision to allow the equivalent feces of about 250,000 people just upriver of where we live along the southern Pomme de terre river do NOT live there, nor do your children and grandchildren.

Kelly Skaurud **Letter 1133**

The EIS is not necessary for Riverview's West River expansion. MPCA's EAW should be more than sufficient. Thank you

Taylor Gibson **Letter 1134**

I have been working with riverview dairy for about 3 years now. The issues that people are having do not know how the company is. The people not only the hired hands but also the vendors (outside resources that maintain operations) are treated with upmost respect. When an issue is presented the issue is delt with accordingly. The cows are treated very well and are very healthy. Not only the day to day operation is great, look at all the other things the dairy brings to the table. Fertilizer for the fields, for farmers its guaranteed place for silage, wheat, straw. For towns it's more money being spent at gas stations, grocery store. There is very little to no smell. Keep up the great work riverview!

Amanda Holslin, Holslin Family Farms **Letter 1135**

ATTN: Charles Peterson

I am writing this on behalf of my 4-generation small family farm, which is about a mile from the proposed dairy barn, which already has an 8,000 head barn. On a windy day, the smell is unbearable, I can't imagine what it would be like if they added 10,000 more cattle.

I believe that they don't just need an EAW, they should be required to have an EIS done, otherwise you will probably have one in your backyard someday too. If approved, say goodbye to water, roads and fresh air, that is just touching the surface of the problems.

Large facilities like this do not exist in isolation. Increased manure application raises the risk of nitrate contamination in groundwater, something rural families, like ours, rely on for drinking water. Increased truck traffic affects local roads that were never designed for heavy, constant loads. Odor doesn't respect property lines, and wildlife habitat that has existed here for decades is altered or lost entirely. These impacts fall disproportionately on nearby residents who have little choice but to live with the consequences.

I will end with this. Small, family-run farms like ours are not asking to stop progress. We are asking for accountability, transparency, and thoughtful decision-making that values people, land, and long-term sustainability over short-term corporate gain. I am tired of watching rural communities absorb the costs and pains while others reap the benefits. Something needs to change.

Sincerely,
Holslin Family Farms

Jay Sheets **Letter 1136**

As a resident of Stevens county and living within 4 miles of Riverviews Dollymont dariy, I have great concerns over Riverviews proposed feedlot expansion. If I'm not mistaken, Riverview was only permitted to drill one well at Dollymont and limited in their total capacity to 9000 head of cattle. Dollymont dairy currently has 2 wells and are milking around 11,000 head. Of the two wells, both penetrate deep enough to go through the sandstone ledge that protects the larger lower aquafer which lies below mine. My well is 193 feet deep. My wife grew up on the farm we now live on, I'm very familiar with the water on this farm. Of the 40+ years of using the water here; it's only been in the past five to six years I've seen the water go from strictly a rusty iron and sand problem to a heavy manganese problem. Dollymont has drilled not one but TWO wells to the depth of 273 feet. Which can draw water from my shallower aquifer down through the sandstone into the lower aquifer. How are the residents of this county supposed to trust that Riverview wouldn't violate any permit they file, given their history in Dollymont twsp? I propose we need a full EIS to study what effect long term water use of this amount will do to these upper (shallow) aquafers. Also given the effects of what happened down in Arizona and what's happening with the well on my property, only 4 miles from another dairy; that I consider to be in direct violation of the permit initially proposed I'd say it warrants consideration. Thank you for your attention to this matter. Jay M. Sheets (concerned resident)

David Soehren **Letter 1137**

Any project of this magnitude should be required to provide a fuLL Environmental Impact Statement rather than just an EAW. The potential problems of water usage, Manure management, and potential spills can then be properly assessed.

Melissa Bakker Roach **Letter 1138**

This is the worst kind of "farm". This is not good for anything: not people, not farms, not rural communities, not consumers, not cows, not the environment. This is not a good neighbor and puts smaller dairy farms, family farms across the state, in danger. No to River Dairy.

Amy Werk **Letter 1139**

I support Riverview's proposed West River Dairy Expansion. The EAW is completed and adequate. All environmental concerns have been addressed and reasonable effort has been made to reduce or mitigate risks. Riverview is a very important member of Stevens County, the Morris community and the state of Minnesota. They are good stewards of the land and the animals. Riverview goes to great lengths to protect the environment and comply with all regulations. Please allow this project to move forward with the EAW. Thank you.

Jeanne Johnson **Letter 1140**

I and all people who value the land andthe cattle oppose this unconscionable project. I don't need to recount the reasons.

Adam Zelltwanger **Letter 1141**

The environmental review is sufficient, no EIS needed

Landon Koehl **Letter 1142**

I strongly support the project moving forward. NO EIS IS NEEDED!Thank you for your time and effort you have put into this project

landon koehl

Lucas Koehl **Letter 1143**

I strongly support this project moving forward. No EIS necessary!

Thank you MPCA for the work you've put into this permit!

Baldomero Penaloza **Letter 1144**

I support west river expansion.

No EIS reqquired.

Osvaldo Penaloza Gomez **Letter 1145**

I support west river expansion. No EIS required.

Thanks.

Anthony Anker **Letter 1146**

I am writing to support the West River expansion and urge the approval of the permit without the need of the EIS. Riverview consistantly does the right thing in all parts of their operation. They are clean, consistant, careful, and considerate of neighbors. They have proven track record of following the state permits that they already have received. Requiring another study for this permit is unnessecary as they

continue to follow all the rules. I am proud to live near a Riverview site as they make good neighbors and are good for our community.

Tyler Thiel **Letter 1147**

I fully support the West River Dairy Expansion. No EIS should be needed.

Javier P Torillo **Letter 1148**

I support the project

Riverview is good company for me and my family.

Froncisco Guadarrama Capitaine **Letter 1149**

I support West River Expansion

No EIS required

Jodi DeCamp **Letter 1150**

1)Any project of this size should demand that an EIS be done.

2)An EIS was required for a smaller project in Baker Township in Stevens Co. & the Fehr's dropped the project. If these projects are environmentally safe, why would there be opposition to doing the EIS.

3)Have you considered the adverse impacts caused by other dairies owned by the Fehr's in both MN and other states? i.e. drinking water, our spreading of manure, etc.

4)Cropland for upcoming young farmers is unavailable due to the Fehr's outbidding anyone.

5)An EIS would address socio-economic and community concerns.

Cameron Adams **Letter 1151**

I support the West river Expansion. Riverview is a great facility, follows all the rules and sets the standard. I trust the MPCA is very thorough in there analysis. No EIS needed.

Kevin Stallman **Letter 1152**

We support this project

No need for EIS

Dustin Nelson **Letter 1153**

I support the west river expansion. We need businesses in rural MN that care about the community they live in and they've shown that all the time. There dairies are immaculate and the people are top notch. Thank you to the MPCA.

Heidi Wellnitz **Letter 1154**

I fully support this project and do not believe EIS is needed.

Matt Wellnitz **Letter 1155**

I support the West River Dairy Expansion, there is no EIS needed.

Lowell Moser **Letter 1156**

I am Lowell Moser and have lived all 62 years of my life in Stevens County.

I want say thank you to the MPCA for doing such a complete job of working through the EAW on this Riverview Site.

I donot believe that an EIS is necessary. The family that owns & operates Riverview is first rate and top notch when operating their dairies.

Thank you!

Rob Needham **Letter 1157**

Highly recomend the project

No need 4 EIS

Mike Wade, Wild Rice Electric Cooperative **Letter 1158**

We would like to express our support for Riverview Dairy and its planned expansion in Stevens County. As an electric cooperative, we work with Riverview Dairy by providing electric service to one of their facilities in Norman County, Minnesota, and our experience has been extremely positive. Their management staff are professional, easy to work with, and operate their facility based on the highest of standards. They take the time to provide our cooperative with educational tours of their facilities, and we meet with them regularly to discuss ways we can work together on common interests. Riverview Dairy is a strong community partner and helps support jobs and economic growth in a rural Minnesota. Based on our experience with Riverview, I have full confidence that the expansion of the dairy will have a very positive impact on the area.

Felipe Jaimes Aviles **Letter 1159**

I support the West Riverview Expansion. No EIS required.

Sam Bradshaw **Letter 1160**

I fully support the West Riverview Dairy expansion and no EIS required.

Diego Velazquez Sanchez **Letter 1161**

I support the expantion of West R.

No EIS required

Martha Cristina Lopez H **Letter 1162**

I support the West Riverview expansion.

No EIS required.

Paulina Velazquez **Letter 1163**

I support the West Riverview Expansion. No EIS required.

Phillip Earle **Letter 1164**

I support Riverview and there west river expansion. No EIS is needed.

James Morais **Letter 1165**

living in Nashwa Minnesota close to 2 Riverview Dairy's I never have any smells or water problems in fact they as a company always help the community, and with the dairy's there the community thrives. More work opportunity and the community grows.

Diary's have a great way in bring community together and ensuring work opportunity. Over the past few years there was and is still no issues regarding water problems I am all for the dairy's as they are a great construction to the community.

Taylor Flemming **Letter 1166**

I support West River/Riverview expantion.

No EIS rquired

Tony Tillma, Valley Dairy Supply **Letter 1167**

MY NAME IS TONY AND I AM CO-OWNER OF VALLEY DAIRY SUPPLY, BASED IN CORONA SOUTH DAKOTA. I AM WRITING THIS IN SUPPORT OF THE PROPOSED EXPANSION OF WEST RIVER DAIRY IN STEVENS COPUNTY MINNESOTA.

BALLEY DAIRY SUPPLY HAS 21 FULL TIME EMPLOYEES. WE SUPPLY DAIRY FARMS WITH SUPPLIES, CLEANING PRODUCTS, ANDPERFORM MAINTENANCE SERVICE FOR THE DAIRIES

RIVERVIEW AS A WHOLE IS A HUGE PIECE OR OUR BUSINESS. I BELIEVE THE PROPOSED EXPANSION WILL BENEFIT THE LOCAL COMMUNITY AS WELL AS THE DAIRY INDUSTRY. IT ONLY TAKES A DRIVE PAST ANY OF THEIR FARMS TO SEE THAT RIVERVIEW IS A TOP NOTCH PRODUCER.

I RESPECTFULLY ASK THAT YOU SUPPORT THIS EXPANSION.

Gerhard Prinsloo **Letter 1168**

I support the west river expansion. Great company. Always clean, great people. Care about the community. No EIS. Thanks.

Rodrigo n/a **Letter 1169**

I support West River/Riverview expansion

no EIS required

Brett Peterson **Letter 1170**

I am not in support of A EIS they are not needed

SG Prinsloo **Letter 1171**

I work for a farmer that works with the dairy. I run dozer for forage harvest. The site is amazing. The people are great. Why wouldn't you want something this in your area. People are scared of change.

Trust the MPCA. They know what there doing. I support the expansion and NO EIS needed. Start building it.

Nancy Fabiola Acevedo **Letter 1172**

I highly support the West River Dairy expansion! I think there's no EIS required.

Marco Grubinoew **Letter 1173**

I support the expansion. No EIS needed.

Victoria Dalager **Letter 1174**

With the impact on our aquafier and the history of Riverview's treatment of water use needed by anyone but them, please do an evaluation before Stevens County ends up like the Wilcox Basin in Arizona.

Anonymous Anonymous **Letter 1175**

I support the West Riverview expansed

It is a great oportunty for the people of Morris, MN.

Anonymous Anonymous **Letter 1176**

I support the West Riverview expansed

Mathew Miller **Letter 1177**

I support the expansion. No EIS needed. Thank you to the MPCA for doing there work on this. If this review has been multiple years. I don't see any shortcuts being taken. Trust the process. Thank you.

My family supports the West River Dairy extension because of the economic oportunities for the communty.

Susana Corona **Letter 1182**

I support the West Riverview expansion.

No EIS Required

Rodney McCollum **Letter 1183**

My name is Rodney McCollum and I am the owner/operator of McCollum Hardware, a retail hardware store serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,
Rodney McCollum

No EIS required

Juan Pablo Alvarez **Letter 1190**

I support the project.

No to the EIS

Don Wienhold **Letter 1191**

Regarding Riverviews expansion I feel they definitely need an EIS or outright denial. My main concern is healthy aquifers for many generations to come, by not over pumping or polluting with high nitrates. We need to look at aquifers as the miracle they are, we can draw water from the ground and it is drinkable and life-sustaining. When an aquifer is over pumped it leads to poor water quality and the possibility of collapse, then it loses storage capacity permanently. If the aquifer is compromised it affects way more people than can be quantified, possibly forever.

I am all for science and research, but there comes a time when you need to put on your common sense hat and look at the massive water usage this operation would have. Anytime you compare the water usage of one operation to an entire city it tells you this cannot be allowed.

What we need in this state is an animal unit cap, because anytime you leave it up to businesses, like Riverview, they push for absolute crazy amounts. Anytime you put the making of money ahead of the environment it is not a good thing.

I hope that people can see a trend here, that Riverview is never happy with their current size, they always want more.

Jorge Mehel **Letter 1192**

I support the project.

No EIS needed

Michael Anderson **Letter 1193**

I would like to take this opportunity to provide comments on the proposed West River Dairy Expansion project. My name is Michael Anderson. I am a farmer and business owner from the Hillsboro, ND area. I have had the opportunity to meet and work with Riverview Dairy in several capacities over the last several years.

One of the most striking things that I have experienced working with this group is the amount of transparency and a willingness to answer concerns and questions. Their model of doing business has been much appreciated in my area and with their numerous other projects. They have taken people's concerns and provided time and resources to answer questions effectively and completely. Their concern for people has been evident in everything they do.

The amount of opportunity provided by their projects has been very impactful. They have demonstrated a willingness and commitment to work with local businesses and vendors as much as possible to provide for their needs. I have witnessed many individuals and businesses having new hope and optimism for their area because of the new opportunities to work with Riverview.

Their facilities and operations that I have seen have all been first class. The sites are operated with pride and concern for the area they are located in. Animals are treated humanely and with detail to maintain

health, comfort, and productivity. I have enjoyed meeting and visiting with a very wide range of employees and staff.

The positives are numerous and wide ranging. The impact of this project will be a blessing for the rural economy and provide opportunities for many to benefit. Your support and approval of this project will have lasting positive outcomes to so many people and the entire area.

Respectfully Submitted,
Michael Anderson

Martin M. Ruano **Letter 1194**

Brian Wojtalewicz **Letter 1195**

Facts: After "hard fought negotiations" this same dairy agreed to pay $11 Million and make long overdue changes on groundwater use in Arizona. See more facts here and at related media articles: https://www.azag.gov/ag-mayes-announces-riverview-settlement

Nancy Malcomson **Letter 1196**

We don't need more consolidated farms in the hands of so few. Is this dairy oligarchy? This expansion will harm our earth in terms of water quality, increased herbicides and pesticides on the lands supporting the cows.

Please DO NOT permit this expansion.

Stuart Knappmiller **Letter 1197**

As a member of the Land Stewardship Project, I'm concerned about the way our dairy industry is being contracted from small dairies and expanded by large dairies with huge numbers of cows.

Large numbers of live stock mean more pollution at a specific site, less crop diversity, lower prices for family farmers and fewer farms to support rural economies. Corporate farms probably don't buy in town or send their children to local schools as we did on our 228 acre 28 cow farm. We always had a job for a live in worker or college student who needed the income and room and board provided. Corporate farms ar driving small farmers out of the business and damaging rual communities. More small, thriving dairies means stronger rural economies and a more resilient food system.

Margaret Kuchenreuther **Letter 1198**

I write to urge the MPCA to require Riverview LLC to complete an Environmental Impact Statement (EIS) before approving their proposed River West Dairy Expansion. This dairy operation, if approved, would be the largest feedlot in Minnesota and 500 times larger than the average dairy farm in Minnesota (Land Stewardship Project 2026). An agricultural operation of this unprecedented size deserves especially careful scrutiny in view of its potential to affect the economic, social and environmental conditions of both our local region, and potentially, the nation. Below are just a few of the reasons I believe an EIS is warranted before this project can move forward:

1.The most important reason to require an EIS is that the Environmental Assessment Worksheet (EAW) filed by Riverview considers only the environmental effects of this proposed dairy expansion. It is not designed to also incorporate analysis of the economic and social effects the expansion is likely to

produce. The Land Stewardship Project (2026) recently produced a white paper that discusses dairy markets and the effects that production consolidation has on small operators. I find their analysis, echoed by a recent story in The New York Times (Saslow 2026), to be very concerning. Our current dairy market system is obviously broken, with production costs often exceeding earnings. Consolidating milk production in the hands of a few huge operators is unlikely help the prospects of small operators. Stressing the economics of small operators throughout Minnesota disrupts the lives of farm families and the economics of small towns, as well as leading to an epidemic of mental health issues and suicides among farmers (Rural Health Information Hub 2026). Only by requiring an EIS can the MPCA thoroughly investigate the important economic and social effects of this project.

2.Riverview's EAW acknowledges that ongoing climate change is expected to increase the frequency of heavy precipitation events, in addition to increasing average annual temperatures. They assert that building stormwater retention ponds that are 20% larger than that required to hold water from a 25-year precipitation event will be enough to reliably handle runoff from their impervious surfaces. However, I am not confident that this assertion is justified. The Minnesota Department of Natural Resources (2024) notes that heavy rainfall events are becoming more frequent in our state, meaning that "25-year" events may occur more often than historically expected. Given the current state of our climate and especially the changes expected in the coming decades (UMN Climate Adaptation Partnership 2026), I believe that, within the context of an EIS, Riverview should be expected to provide modeling of how well projected increases in precipitation (especially heavy rainfall events) would be handled by both their stormwater retention ponds and their manure storage facilities in order to prevent contamination of the Pomme de Terre River and adjacent wetlands.

3.Another important effect of climate change is the way that projected warmer and wetter springs (UMN Climate Adaptation Partnership 2026) will affect nutrient retention in fields after fall manure application. Historically, winters and springs were cold enough to keep most of the nitrogen from fall-applied manure in the soil profile. However, data show that unusually warm February and March temperatures (which are likely to become increasingly common in the future) can cause the loss of nearly all the nitrogen from a fall manure application, even if the manure is injected subsurface and treated with a nitrogen stabilizer (A & L Great Lakes Laboratories. 2026; Bayer Crop Science 2025.) Where will this nitrogen go? Into the Pomme de Terre River, of course, only exacerbated by the ubiquity of pattern-tile drainage of fields in our region. Your own agency has documented that the middle and lower Pomme de Terre has experienced nitrate-nitrogen increases of 11% annually from 2007-20017, resulting in problems with dissolved oxygen and anthropogenic eutrophication (Minnesota Pollution Control Agency. 2024). Manure applications from an operation of this unprecedented size are likely to worsen the condition of the Pomme de Terre, despite the assurances offered in the EAW. And, unfortunately, the negative effects don't stop there. Nutrient pollution in tributaries of the Mississippi River annually causes a dead zone in the Gulf of Mexico (NOAA 2022), adversely affecting biodiversity in the Gulf, as well as the livelihoods of fisherman and those involved in the region's tourism industry. An EIS for this project should explore the likelihood of nitrogen loss from field APPLICATIONS of manure in the face of projected climate change.

Dear Mr. Peterson,

Thank you for the opportunity to comment on the Riverview Dairy expansion project located in Stevens County, MN. Milk trucks drive by our house all the time, one was even gushing milk out a left open valve as it drove by a few years ago.

The MPCA was established in 1967 under Republican Governor Harold LeVander to protect air, water, and the land of MN due to growing environmental concerns. Its focus is to prevent and reduce the pollution of air, water, and land. As stated on the MPCA website, the State of MN appropriated $318 million dollars in 2024-2025 from the Clean Water Fund to various water projects in MN.

I think Attachment 16 MPCA Impaired Waters Map says it all. I see miles and miles of impaired streams, creeks, and rivers downgradient from the designated manure application areas for this project. I see two impaired lakes and two impaired wetlands in this attachment. The approval of this expansion will potentially add such lovely words as E. coli, Cryptosporidium, Eutrophication, and Giardia to this attachment. Do you know how much of the $318 million was spent on investigating and cleaning up the waters of Attachment 16?

The job of the MPCA is to protect the environment so people can live in it. It is not the job of the MPCA to promote big business and agriculture. If the MPCA truly cares about the environment and waters of MN, then prove it. Require the completion of an Environmental Impact Statement for this expansion, the people of Attachment 16 deserve it.

I'm writing in support of the West River Dairy/feedlot project. As someone with knowledge in animal production, I recognize the importance of responsible livestock operation for local economies and food systems. Modern dairy and feedlot operations are designed with environmental management practices that minimize risks to water, soil, and air quality when properly regulated and monitored. I trust that the Minnesota Pollution Control Agency will ensure that all environmental standards are met.

This project represents an opportunity to strengthen the local economy, create jobs and support agricultural development in the region.

With appropriate oversight, it can operate responsibly and sustainably.

I respectfully support the approval of this project.

No EIS required.

Josue Roberto Moreno Soriano **Letter 1227**

I'm writing in support of the expansion of the West River Dairy/feedlot project. Responsible expansion of livestock operations can be done in livestock operations can be done in a way that protects both the environment and surrounding community when proper management system are in place. Modern manure management systems are specifically designed to prevent contamination for water and air. When handled correctly manure is not waste but a valuable resource that can be safely stored, treated, and applied as fertilizer in accordance with nutrient management plans. These practices help recycle nutrients, reduce reliance on synthetic fertilizers, and protect soil health. Concerns about water and air quality are valid: however, current regulations and monitoring requirements ensure that operations must meet strict environmental standars. With proper oversight, runoff, leaching and emissions can be effectively controlled and minimized. Expansion also brings economic benefits to the region, including job creation, support for local agriculture, and longterm sustainability of farming community. I respectfully support the expansion of this project, as it can operate responsibly, sustainably, and in compliance with environmental regulations. No EIS required.

Concerned Citizen **Letter 1238**

How big is too big? Require an EIS. If there truly is no environmental concern a completed EIS will show that, yet the EAW documents are filled with concerns about water allotment, catch basins, and manure proximity to bodies of water. Simply stated the reluctance to do an EIS implies there is negative environmental impact to be found within the scope of the West River expansion. If all the energy that has been put in to avoid an EIS was put towards one, it would be done already. The reputation of Riverview has always been to go above what is "required" in order to do good work, here is the chance to do such a thing and it is being fought, why?

There should be an increased concern for a project of this size within such proximity to impaired waters such as the Pomme de Terre River which continue on into the Minnesota and Mississippi Rivers. As seen with the large manure spill near Pennock a year ago that has gone rather under the radar, accidents can and do happen. What happens when an event of similar scale, 1+ million gallons spills again, but this time into field drainage tiling that goes to county ditches and into the Pomme de Terre? It is the duty of Minnesotans to ensure we are good stewards of waterways that millions of people both in state and downstream count on. These rivers and waterways are crucial to the Midwest in being used to move goods, provide jobs, feed a nation. Causing irreversible damage needs to be avoided. Any action that will cause negative impacts should be explored, alternatives found, and plans changed. An EIS should be required.

The above only touches on the water impacts, there is also road/traffic, site noise, and community impacts that need to truly be evaluated. Please require an EIS before something goes wrong and can't be undone.

Justin Englebert **Letter 1239**

My name is Justin Englebert, and I am the Key Account Manager for Perdue Animal Nutrition, a leading dairy feed supplier serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,
Justin Englebert

I support the West Riverview expansion

Alan Stokke, Prairie Pest Control **Letter 1245**

My name is Alan Stokke, and I am the owner/operator of Prairie Pest Control, a company that provides pest control services to agricultural operations throughout Minnesota, including Riverview.

I am writing in support of Riverview's proposed West River Dairy expansion in Stevens County.

Through our work within the agricultural industry, we understand firsthand how important a strong and stable livestock sector is to rural communities and local businesses. Operations like Riverview create reliable economic activity that supports local jobs, encourages investment, and allows small businesses like ours to continue growing and reinvesting in the communities we serve.

Our company has had direct experience servicing Riverview locations, and we have consistently found their facilities to be extremely well maintained, organized, and professionally operated. Cleanliness and sanitation are clearly a priority within their operations, which is something we see firsthand while performing pest control services at their facilities. Their attention to maintaining high operational

standards reflects positively on both their management and their commitment to responsible agricultural practices.

This proposed expansion represents a significant economic opportunity for the region. It will increase demand for local vendors and service providers, support both construction and long-term employment, and strengthen the rural communities that depend heavily on agriculture.

Based on our direct experience working with Riverview, they have consistently proven to be a professional, responsible, and dependable partner. Their operations contribute positively to the communities where they do business and help support a broad network of agricultural and service-related industries.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture helps ensure that local businesses can continue providing jobs, services, and economic stability close to home.

In my opinion, an Environmental Impact Statement (EIS) is not necessary, as Minnesota's environmental review process is already thorough and rigorous. I respectfully encourage your support and approval of this important project.

Sincerely,
Alan Stokke
Prairie Pest Control

Randy Thymian **Letter 1246**

McGinnis Appliance has been involved in the majority of Riverview's projects from the very beginning. With each project, Riverview has consistently chosen the path of quality and continuous improvement rather than taking the easy way out. Their commitment to asking, "how can we be better?" sets the tone for every collaboration. Working with a partner who values doing things the right way without short cuts-makes our work smoother and more efficient. Riverviews dedication to excellence keeps projects on track and reflects the integrity they bring to our community. Riverview plays a vital role in supporting small businesses throughout west -central Minnesota their long-standing presence and community first mindset makes meaningful difference. At McGinnis Appliance, we PROUDLY SUPPORT this project because Riverview continually demonstrates that they are invested in our region's success and are here for the long haul. Thank you!

No EIS is needed.

Brett Sletta, Prairie Pest Control **Letter 1247**

My name is Brett Sletta, and I am an employee with Prairie Pest Control, where we provide pest management services for agricultural operations across Minnesota, including Riverview Dairy locations.

I wanted to express my support for Riverview's proposed West River Dairy expansion in Stevens County.

As someone who regularly works inside agricultural facilities, I've had the opportunity to see firsthand how Riverview operates on a day-to-day basis. Their locations are consistently clean, organized, and professionally maintained. In our line of work, those things matter, and it's clear that Riverview places a strong emphasis on sanitation, upkeep, and maintaining high standards throughout their operation.

Beyond that, businesses like Riverview play a major role in supporting rural communities and local economies. Expansions like this create opportunities not only for agriculture, but also for many local businesses and service providers that work alongside the industry every day. Projects like this help

support jobs, increase economic activity, and provide long-term stability for communities throughout the area.

From our experience working with Riverview, they have always been professional and easy to work with, and they continue to make a positive impact on the agricultural industry and the surrounding communities they operate in.

Agriculture is a critical part of Minnesota's economy, and continued investment in modern, well-managed operations is important for the future of rural communities. I believe the environmental review process already in place is comprehensive and appropriate, and I do not believe an Environmental Impact Statement is necessary for this project.

I respectfully encourage support and approval of the proposed West River Dairy expansion.

Sincerely,
Brett Sletta
Prairie Pest Control

Dick Metzger **Letter 1248**

I strongly support this project. An EIS is not needed. An EAW with over 900 pages of information is very thorough and ongoing oversight by MPCA is enough regulation to make this projects passage keeps it in compliance with current rules and regulation.

Jordan Staples **Letter 1249**

I support this Riverview Project and no EIS is required. EAW provided should suffice.

Brad Visser **Letter 1250**

As a contractor who has worked with Riverview I have not seen a company more dedicated to the environment than they are. I would strongly encourage permitting to allow for the betterment of rural minnesota. As they are strong members of the community and also a very positive impact to the local and state economy I believe permitting should be granted. Rural minnesota is in economic distress and having such great stewards of the land only makes sense. Thank you for your time.

Marcos Lazarro **Letter 1251**

I support the project, No EIS needed.

Amanda Bilek, Minnesota Corn Growers Association **Letter 1252**

Dear Mr. Peterson,

After reviewing the Environmental Assessment Worksheet (EAW) for the proposed expansion at West River Dairy, the environmental review of the project is comprehensive and complete. Additionally, Riverview has a proven track record of environmental stewardship, including continuous efforts to reduce water use and the construction of innovative water-recapture basins to reduce reliance on a single water source.

Based on the information provided in the EAW, the project includes appropriate design features, regulatory compliance measures, and mitigation practices to minimize environmental effects.

In particular, the EAW demonstrates that:

- Manure management, water quality protection, and land application practices are in accordance with current regulations;
- Air quality, odor management, climate adaptation and resilience have been considered and addressed; and
- Traffic, infrastructure, and surrounding land uses have been evaluated at a level appropriate for the scale of the project.

According to the MPCA's website, "the MPCA uses the EAW process to decide whether the project's potential environmental effects should be studied further through an environmental impact statement (EIS)." The Environmental Assessment Worksheet and full environmental review process assess the risks and conditions outlined for the construction and operation of a feedlot project. Minnesota's extensive environmental review process should remain the guide for the determination of environmental risk. We would encourage the MPCA commissioner to focus on the facts of the project and use objective, scientific judgment in the review process.

Please do not hesitate to contact Amanda Bilek, Senior Public Policy Director, at 952-460- 3604 or abilek@mncorn.org with any questions.

Sincerely,
Wesley Beck
President
Minnesota Corn Growers Association

Amando Chagoua **Letter 1253**

I support the project; no EIS needed

Madeline Maxeiner **Letter 1254**

A proposal of this magnitude, an increase of this size, must be evaluated as carefully as possible. Failing to require an EIS would cut corners and let many legitimate concerns go unaddressed. River View should expect to fulfill the most careful examination....not the least. Please do your job. Just on the basis of the extreme magnitude alone!

Rosalind Alexson **Letter 1255**

I can't believe there is any debate about an environmental assessment with an expansion of this size. That should be standard operating procedure. We shouldn't have to be petitioning for this. Of course we want to know how this will impact us. Our very lives depend on it. .

Brad Lewison **Letter 1256**

Riverview does an A+ job taking care of their Dairies and the cows they have. There is no reason this should be stopped from happening. Just look at the current sites that they have, they operate at the top of the class.

Randal Gorder **Letter 1257**

I have a Riverview Dairy (Waukon Dairy) 2 miles from my home and farm, I am also the Treasure and Clerk for the Waukon Township. I live north of the Dairy and do not smell any bad odors or hear any noise from their site. They have designed an operation with the community first, truck traffic is sent to a state highway, equipment noise is concentrated in between a silage pile and buildings. The cows are

happy and don't make hardly any noise. As a Town Board Member I had the same comment from multiple Waukon residents, "when are they going to bring the cows in" my response was they have been here for a month, 3 months and I even had to say almost a year that's how clean and quiet the Dairy is to live next to. They are always learning how to make it better, like water usage, to controlling dust on the gravel roads during corn and haylage harvest. Riverview has brought more to the community than just cows to milk, they have brought jobs, manure instead of commercial fertilizer and economic benefits that would not have been here without them.

Andrew Israels-Swenson **Letter 1258**

As a resident of Morris for 20+ years I am not here to bash Riverview at all. I think they bring a lot of diversity to our community and for that I am grateful. I do think that we as a diverse community need to gather all of the information on how this proposal will affect us. To do so we need independent environmental and economic impact statements from an outside source that is not Riverview. We all saw what happened with them in Arizona. Please do not put profit above the natural resources in West Central Minnesota.

Anna Kilian **Letter 1259**

Hi I am writing to express my concern with the riverview dairy expansion and request the MPCA do full environmental impact statement.

I was unable to attend the in person meeting due to it being full by the time I arrived before the start. I am disappointed that I was not able to listen in and gain a better understanding of the EAW and ask any questions. Thus I have had to gather information via this internet and the bias that come from those information sources. I witnessed many people not able to attend and gain more information about how the dairy expansion will affect the community both good and bad. Since we (as a community) could not learn I urge the MPCA to do a full environmental impact statement to better protect the residents of Morris and Stevens county. I feel more information is always good and taking precautions always saves time and money in the long run. I have seen this time and time again through my career. Taking time to better prevent an outbreak saves more time and money in the long run.

My specific concerns about the expansion is surface and ground water contamination. The more drainage tile that is put into farm field leads to more flooding as water moves faster than it historically did in the prairie pothole region of MN. I have concerns that the expansion will be part of contributing to this flooding as well as being affected by it. If manure or other contaminants get into the pomme de terre river that not only affects the Morris community but every other community in the watershed south of us. I would like to see Stevens county set a good example and be a good neighbor to those downstream from us. I also have concerns about how riverview will mitigate spills and negative environmental impacts. It's well know that leaks, and contamination will occur, it's more a matter of when not if. If a EIS is not done will this lower the responsibility that riverview will have to claim? I want to make sure that our environment will be cleaned up in the best way possible and responsible parties be held accountable.

Thank you for your time and for reading my concerns. I hope you choose to move forward with a full environmental impact statement.

Gary Dukes **Letter 1260**

To: Minnesota Pollution Control Agency (MPCA)

I am writing to formally express my strong opposition to the proposed expansion of the West River Dairy facility near Morris, MN. This project, which seeks to increase capacity from 7,855 cows to 18,855 (totaling over 26,000 animal units), is unprecedented in the state of Minnesota. Given the massive scale and the history of this specific site, I urge the MPCA to deny the permit or, at minimum, require a comprehensive Environmental Impact Statement (EIS) before further consideration.

1. **Water Quality and Watershed Impairment**

The facility is located within the Pomme de Terre River watershed, a system already listed as impaired for bacteria and nutrients.

- Waste Volume: The expansion would result in approximately 250 million gallons of liquid manure storage. The risk of catastrophic failure or "allowable" seepage from clay-lined basins poses a permanent threat to local groundwater and the Pomme de Terre River, which flows into the Minnesota River.
- Application Risks: In a region prone to heavy spring rains, the saturation of phosphorus and nitrogen in the soil leads to inevitable runoff, worsening toxic algal blooms downstream.

2. **Massive Groundwater Depletion**

Riverview LLP has requested to pump 226 million gallons of water annually. Concentrated pumping of this magnitude threatens the domestic wells of neighbors and the long-term viability of the aquifer for the broader community.

3. **Public Health**

The emission of hydrogen sulfide, ammonia, and nitrous oxide (N2O) from a facility of nearly 19,000 cows is a significant public health hazard.

- Respiratory Impact: Neighbors are subjected to particulate matter and noxious gases that are linked to asthma, bronchitis, and other chronic respiratory conditions.
- Climate Change: N2O is a greenhouse gas roughly 300 times more potent than CO2. Permitting a single facility to emit such a concentrated volume contradicts Minnesota's stated climate goals.

4. **Social Justice and Economic Disparity**

The expansion of "Mega-Dairies" is not a neutral economic development; it is a driver of rural inequity.

- Consolidation vs. Community: By flooding the market with industrial-scale milk production, Riverview systematically pushes small- and mid-sized family farms out of business. This destroys the fabric of rural Stevens County, replacing independent business owners with a transient, low-wage labor model.
- Environmental Justice: Industrial CAFOs are consistently sited in rural areas where residents have fewer resources to fight protracted legal battles. This places the "negative externalities" of corporate profit—pollution, road damage, and smell directly onto the shoulders of local citizens while the profits are exported.
- Lack of Oversight: In 2014, the MPCA Citizens' Board ordered an EIS for a much smaller version of this project. Since that board was abolished, the lack of a mandatory EIS for a project three times larger represents a failure of democratic oversight and a victory for corporate lobbying over public interest.

Conclusion

The MPCA must recognize that the "West River Dairy Expansion" is not a standard agricultural project; it is an industrial experiment at a scale Minnesota has never seen. I urge that a full EIS be conducted to study the cumulative impacts on our water, our climate, and our rural social structure.

Sincerely,
Gary Dukes

Martha Koehl — Letter 1261

I am one of the closest neighbors to West River Dairy, living in Horton Township just one mile from the proposed dairy expansion site. I grew up in Stevens County, and have lived here my entire life, having been a close neighbor to Riverview since 1995 when the first dairy was built. I have been part of the Riverview team for over a decade, choosing to return to my hometown after attending college out of state. Stevens County is a special place; made that way by the people that live here and the opportunities they've created through business and community growth to set current and future generations up for success.

Please see my attached comments on why the EAW shows that an additional EIS is not needed.

___

Public Comment in Support of the West River Dairy Expansion

Submitted to: Charles Peterson, MPCA Resource Management and Assistance Division

I am writing in support of the proposed West River Dairy Expansion in Synnes Township, Stevens County, and to respectfully urge the MPCA Commissioner to issue a negative declaration on the need for an Environmental Impact Statement. As both a neighbor living one mile from the facility and a member of the Riverview team, I can speak to the care with which this operation is managed and to the thoroughness of the environmental review that has been conducted. It is my considered view that the

EAW adequately identifies and addresses the project's potential environmental effects and that an EIS is not warranted.

The EAW Is a Thorough and Sufficient Environmental Review

Under Minnesota Rules, an EIS is required only when a project has the potential for significant environmental effects that cannot be adequately anticipated, controlled, or mitigated through ongoing regulatory authority. The EAW before the Commissioner addresses every resource category required by Minnesota law and demonstrates, with supporting technical data, that each potential effect is localized, controllable, and well within existing state and federal regulatory limits. The document includes AERMOD dispersion modeling for air quality and odor, stormwater hydrology analyses, groundwater appropriation data, manure management acreage calculations, and cultural and natural resource reviews. These are not cursory treatments; they are detailed, conservative, and supported by professional engineering work. The EAW does precisely what Minnesota's environmental review program intends it to do: it lays out the facts and demonstrates that any potential effects from the project are mitigated and controlled and would not rise to the level of significance that would require further study.

Firsthand Observations as a Neighbor and Employee

I offer these comments as someone who has lived near Riverview's farms my entire life. I have personally observed the environmental practices that the EAW describes.

Manure management and nutrient planning. I have seen how carefully manure is handled at Riverview's farms. Application is done by knife injection at agronomic rates in accordance with an MPCA-approved Manure Management Plan. Manure is sampled regularly, and application rates are watched carefully. Local farmers have made far more acres than required available for application, which provides a significant buffer and eliminates the need to apply on unsuitable fields or during winter months. These are not abstract commitments in a permit document; they are practices I have witnessed carried out year after year by people who take the stewardship of the land seriously.

Odor control. Riverview's use of impermeable synthetic covers on liquid manure storage areas, combined with knife injection during land application and consistent housekeeping practices, keeps odor well managed. The EAW's AERMOD modeling confirms what my own experience tells me: odor levels at neighboring residences remain below the state's faint-odor threshold. Living where I do, I would be among the first to know if that were not the case.

Water quality and wellhead protection. The EAW demonstrates that permanent stormwater basins, sized more than twenty percent above what is required for a 25-year storm event, will capture runoff and reduce both annual runoff volume and modeled erosion compared to the current row-crop condition. The liquid manure storage areas are constructed with clay liners that exceed the required minimum, perimeter drain tile for monitoring, and fourteen months of storage capacity rather than the required nine.

Economic Benefits to the Community

The expansion will create skilled local employment and generate sustained demand for crops grown by area farmers. It replaces a significant volume of synthetic fertilizer with manure-based fertility, reducing input costs for local farmers. Approximately 2,200 acres of row crops will be converted to alfalfa, which sequesters carbon and reduces tillage. These are real, measurable benefits to the rural Stevens County economy and to the farming landscape of this region.

Regulatory Authority Is Sufficient

The EAW identifies a comprehensive package of overlapping permits and approvals governing this project, including an MPCA Individual NPDES Feedlot Permit, a Construction Stormwater Permit, DNR Water Appropriation amendments, a DNR Dam Safety permit, a Stevens County Conditional Use Permit, and others. Each carries enforceable conditions, monitoring obligations, and inspection requirements. Riverview has operated the existing West River Dairy under these frameworks since receiving a negative declaration in 2003, compiling more than two decades of permit compliance. That record of compliance provides additional confidence that the regulatory structure is sufficient to address the expansion's environmental effects.

Conclusion

The West River Dairy Expansion EAW is a complete, well-documented, and thorough environmental review. It identifies the project's potential effects, quantifies them against applicable standards, and demonstrates that project design, mitigation measures, and existing permit programs reduce those effects to levels that are not significant. As a neighbor and team member who has seen Riverview's commitment to environmental responsibility firsthand, I respectfully urge the MPCA Commissioner to issue a negative declaration on the need for an EIS and to allow the project to proceed under its proposed permit conditions.

Ben Weiland — Letter 1262

Dear Mr. Peterson,

My name is Ben Weiland, and I am the owner of Weiland Farms. We provide essential services and products to agricultural operations across Minnesota, including Riverview. I am writing today to express my full support for their proposed West River Dairy expansion in Stevens County.

Our business has been rooted in the Minnesota agricultural sector since 1997. Over nearly three decades, we have seen firsthand that a strong and stable livestock industry is the backbone of our rural economy. Operations like Riverview's create the consistent economic activity that allows businesses like ours to grow, hire local workers, and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. Beyond the dairy itself, the project will generate significant demand for local vendors and support both immediate construction jobs and long-term employment. This growth is vital to the health of rural communities that rely on a thriving agricultural network.

From our direct professional experience, Riverview is a reliable and responsible partner. Their presence strengthens the local economy and supports a broad network of service-related businesses. Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota.

Furthermore, I believe the state's current environmental review process is rigorous and more than sufficient to address any concerns; therefore, no Environmental Impact Statement (EIS) is needed. I respectfully encourage your support and approval of this important project.

Sincerely,
Ben Weiland Owner, Weiland Farms

Logan Tosel — Letter 1263

As a local business owner I have had the opportunity to do work for Riverview the past year. My personal experience has been nothing short of exceptional with them. The mentality that I have come up with is if you do your job they'll do there's. I personally think that we can look at the West River

Expansion the same way. The integrity of the company gives me confidence that they will uphold regulations to protect their neighbors, community, and natural resources. I support the West River Expansion.

David Jungst **Letter 1264**

"This permit requires the facility to be designed, operated, and maintained to prevent discharge to waters, except in an extreme storm event."

I have lived in this part of Minnesota for over 50 years. I know West central Minnesota gets extreme weather.

This facility, the Riverview LLP West River Dairy, will see extreme storm events and it will cause damages to the surrounding area. Just last summer in two days, July 27 and 28, the City of Morris got over seven inches of rainfall. When the storage ponds at this site over top, the storm water and manure will flow downstream to the east where just across the road is a large county tile drain pipe and draw that flows to the Pomme de Terre River less than four miles away.

Conversely, I have seen drought when the Pomme de Terre River completely stopped flowing and was reduced to puddles in its channel just downstream from this facility where the well is to be located to supply it.

An EAW (Environmental Assessment Worksheet) is insufficient for this site. The magnitude of this animal confinement operation, which will be the largest in the state of Minnesota, warrants that an Environmental Impact Statement should be required before a permit for this feedlot expansion can be issued.

Laura Aldrich-Wolfe **Letter 1265**

The proposed expansion more than doubles the number of animals held in a confined area, and brings the total to a number that poses an inherent risk to water quality and environmental quality more broadly. We need to reverse the way that animals are managed on the landscape in order to reintegrate their waste safely into the ecosystem. The proposed dairy expansion does the opposite and in a region of Minnesota facing ongoing challenges of water quality degradation. Poor water quality affects Minnesotan public health and biodiversity, impacting present day and future generations. As a scientist who studies effects of nitrogen on ecosystems, I strongly oppose this expansion.

Oscar Galan Trejo **Letter 1266**

I believe it is important to protect the evironment by ensuring proper manure management, preventing water contamination, and reducing air emissions and odors. Ongoing monitoring and sustainable practices should be required to minize environmental impact and protect community healt.

Thank you for cosnidering my comment.

Kari Visser **Letter 1267**

I support the Riverview West River expansion I feel like the plan is good and no EIS is needed

Julia Murillo **Letter 1268**

I support the West River Dairy expansion

No EIS Require

Bernardo Laines Alonzo **Letter 1269**

I soport the West Riverview expansion.

No EIS Required

Marc Stevens **Letter 1270**

EAW

I am in favor of the project. Riverview is a neighbor that I grow feed to sell to them and hope to get manure back. With the building of the processing plant south of Morris what better place to produce the product, close to the plant.

Feedlot permit

Riverview has an excellent record of being environmentally friendly and following and even exceeding regulations. I support giving Riverview the feedlot permit.

Dustin Hollermann **Letter 1271**

The EAW is very thorough. No additional benefit would result from an EIS. Please proceed for permit review.

Megan Horsager **Letter 1272**

I support the West River expansion without any additional EIS. As a neighbor of a Riverview dairy it is my experience that Riverview goes above and beyond the expectations of the MPCA when it comes to issues such as manure management and water quality. The extreame care and causion I have wittnessed Riverview exersize while applying manure is greater then my other operations in the area. Please consider the evidence and track record of Riverview when issuing this permit.

Daniel Granados **Letter 1273**

I support the west Riverview Expansion

No EIS Required

Jim Birkemeyer, R & J Broadcasting, LLC. **Letter 1274**

Dear Mr. Peterson,

My name is Jim Birkemeyer, and I am the Owner of R&J Broadcasting, LLC , a Radio Station that serves Minnesota's and North Dakota's agricultural community. I am writing to express my strong support for the proposed West River Dairy expansion in Stevens County.

Our working relationship with Riverview has given us firsthand insight into how they operate. In an industry built on trust, Riverview stands out for their honesty and transparency. We have always found them to be straightforward in their communications and clear about their operational goals, which allows us to collaborate effectively and reliably.

Beyond the numbers, Riverview demonstrates a genuine community commitment. They don't just operate in rural Minnesota; they invest in it. This expansion will create consistent economic activity that supports local jobs and drives the kind of investment that allows businesses like ours to grow and

reinvest in our own neighborhoods. Their presence strengthens the local economy and supports a vital network of agricultural and service-related businesses.

From our direct experience, Riverview is a professional partner that prioritizes doing things the right way. Projects like this are essential to maintaining a competitive and sustainable rural economy. We believe the state's environmental review process is rigorous and more than sufficient to oversee this project, and therefore, no EIS is needed.

I respectfully encourage your support and approval of this expansion, as it represents a positive step forward for our industry and our rural communities.

Sincerely,
Jim Birkemeyer]
R&J Broadcasting, LLC

Kelsey Olson, CURE **Letter 1275**

Mr. Peterson,

CURE is a rurally based, non-profit organization dedicated to protecting and restoring resilient towns and landscapes by harnessing the power of the people who care about them. On behalf of CURE, I am submitting the following comments regarding the proposed West River Dairy expansion environmental review. We urge the MPCA to take a comprehensive approach that reflects the long-term health of Minnesota's water, land, climate, and rural communities—doing so would be best accomplished with an Environmental Impact Statement (EIS) analysis to inform MCPA's decisions.

Riverview, LLP has applied to expand its West River Dairy animal feedlot to 26,397 animal units, housing 18,855 cows. If approved, this would be the largest feedlot operating in Minnesota. CURE urges the Minnesota Pollution Control Agency to mandate that the West River Dairy expansion undergoes an EIS to fully assess the risks of the dairy expansion. An EIS would ensure that all potential impacts of the proposed expansion are considered, including impacts to air, water, and soil quality, as well as the socioeconomic impacts to rural dairy farmers and the market influence such an operation would have on the milk industry in Minnesota. The preparation of an EIS would support the mission of the MPCA to ensure that every Minnesotan has healthy air, sustainable lands, clean water, and the ability to plan for, and not merely react to, drastic climate events—all of which may be negatively impacted by a facility of this size. Mitigating these harms is only possible if they are correctly identified and evaluated.

According to the state of Minnesota's 2026 Climate Action Framework, manure accounts for 4.1 million metric tons of CO2-equivalent (CO2-e) emissions, the third highest producer of greenhouse gases (GHGs) in the state, with nitrous oxide (N2O) from agricultural soil management, including the application of manure as fertilizer, being the leader in GHG emissions at 15.2 million metric tons CO2-e.2 The production of manure—roughly 520,000 tons annually—may result in significant amounts of methane emissions, strongly undermining the state's climate goals. Additionally, this manure, when held on the land, threatens soil quality and the drinking water of the entire region. And for an area that has already seen small dairy farms going out of business, this expansion further strains the local farming community and consolidates the dairy market in Minnesota. CURE believes that an EIS should be performed for not only this expansion, but any future proposals of this size. The impacts on the economy and land can only be understood through the kind of rigorous examination in an EIS.

I. Water Use and Availability

The scale of the proposed expansion raises serious concerns about groundwater withdrawals in a region already experiencing overuse/stress on aquifers. Large dairy operations require significant volumes of water for animal consumption, cleaning, and manure handling. Riverview is proposing that 226 million gallons of water a year be extracted from an off-site well.[1] This proposal is more than 100 times that of the neighboring city, and almost as much as the entire City of Morris.[2]

While the proposer claims that they "... strive [] to be good stewards of natural resources, including water,"[3] the company's recent actions in Arizona contradict this. Earlier this year, the Arizona Attorney General settled with Riverview, forcing the company to pay $11 million to fund new wells and haul water to the residents of Willcox, after depleting the town's water supply for use at the company's Sulphur Springs Valley dairies.[4]

In this instance, the MPCA should require a detailed, cumulative impact analysis of groundwater use, including potential drawdown effects on neighboring wells, wetlands, and surface waters. Protecting water as a shared public resource must remain a priority over concentrated private industrial use.

II. Manure Management, Water Quality and Climate Change

West River Dairy sits adjacent to the Pomme de Terre River, an impaired waterbody that is already considered one of the most polluted tributaries of the Minnesota River. The MPCA reports that within a 10-year period from 2007 to 2017/2018 there was an annual increase of 11% in nitrate- nitrogen, the leading cause of water pollution in Minnesota.[5] Further review of existing and foreseeable nitrate-nitrogen pollution is vital to determining the potential impacts of the proposed dairy expansion to this already stressed ecosystem.

Manure production and storage can also have significant impacts on water quality and greenhouse gas emissions.[6] That's why the state's updated Climate Action Framework specifically names fertilizer and manure management, as well as management of agricultural landscapes, as ways to reduce emissions and minimize nitrogen runoff and pollution.[7] Guiding these priorities is Minnesota's goal to reduce statewide GHG emissions by 50% by 2050.[8]

The expansion appears to be contradictory to these goals, substantially increasing the volume of manure generated by West River Dairy and heightening the risk of nutrient runoff, spills, and leaching into

groundwater. And because manure emits methane, a potent greenhouse gas, increasing the amount of manure produced is likely to have significant impacts on our state's climate goals.[9]

The MPCA's Feedlot Permit explains that "This permit requires the facility to be designed, operated, and maintained to prevent discharge to waters, except in an extreme storm event." With extreme rain events becoming more frequent, considerations of the impact of possible discharge to waters need to be considered.[10]

The proposed adaptive strategy, as detailed in the EAW—covering Liquid Manure Storage Areas and sizing stormwater basins at 20% above a 25-year, 24-hour storm—does not adequately reflect current climate realities. Out of 12 "mega-rain" events to have occurred in Minnesota since 1860, where 6 inches or more of rain fell during one event, five have taken place since 2000 and the frequency of heavy rain events is expected to double by 2100.[11] Extreme weather events that included heavy rain and flooding occurred around the project location in April and June of 2023[12] and again in July 2025[13], demonstrating the increased frequency of unprecedented and unpredictable weather events.

According to the Minnesota Department of Natural Resources (DNR), mega-rainfall events like these are now more than 2.5 times as common as they were in the late 20th century,[14] with projections showing continued increases in both frequency and intensity.[15] Designing infrastructure using standards based on outdated precipitation data leaves a high risk of pollution overflow and water contamination.

Given that extreme precipitation events are growing more frequent and intense, an EIS is needed to ensure the suitability of proposed adaptations and to understand the potential impacts to surrounding aquifers of a discharge during such an event. Minnesota's current and predicted forecasted extreme weather events need to be correctly applied to proposed mitigation, for full and accurate evaluation. The current EAW does not do this.

According to the state of Minnesota's 2026 Climate Action Framework manure accounts for 4.1 million metric tons of CO2-equivalent emissions, the third highest producer of greenhouse gases in the state,

[15] Minnesota Go, Climate Change Trend Analysis, https://www.minnesotago.org/application/files/6016/4520/5690/Climate_Change_Jan_2022.pdf.

with nitrous oxides from agricultural soil management, including the application of manure as fertilizer, being the leader in GHG emissions at 15.2 million metric tons.[16]

At a time when Minnesota is working to meet climate goals, approving expansions of concentrated animal feeding operations without a full accounting of lifecycle GHG emissions is inconsistent with those commitments. The MPCA should require a thorough climate impact assessment and consider mitigation measures, including limits on herd size growth and investments in emission-reducing technologies. The MPCA must ensure that nutrient management plans are not only technically sufficient on paper but enforceable and resilient in practice and that they align with the state's climate goals, specifically: initiative 2.3.2, manage fertilizer and manure to reduce emissions; and 2.4.1 manage agricultural landscapes to minimize nitrogen runoff and pollution. The proposed mitigations for manure management, which include applying manure fertilizer on fields that are in operation and considering rates of application, still introduce increased manure and therefore N2O into the soil, water, and atmosphere.

III. Species of Special Concern

The Pomme de Terre River, just southeast of Morris, is home to one of the last, if not the only remaining reproducing population of Elktoe (Alasmidonta marginata) freshwater mussels in the Minnesota River watershed.[17] Elktoe mussels are listed as threatened on the MN DNR Rare Species Guide.[18] A primary threat to the Elktoe mussel is non-point source loading from agricultural practices including agricultural runoff from fertilized crops and animal waste (manure) introduced into water ways.[19] The Environmental Protection Agency specifically states that freshwater mussels are sensitive to changes in water quality including altered water flow, sedimentation and the introduction of contaminants, including those from land use activities from agriculture.[20] In fact, in a study published by the MPCA, DNR, and Macalester College stated, "We find that current state water quality standards may not be sufficiently protective of mussels."[21] An EIS is the way to evaluate and propose alternatives to management to ensure all possible protective measures are in place.

The federally protected Northern Long-Eared Bat has also been identified in the project area. According to a White Paper on the Northern Long-Eared Bat from the Little River Band of Ottawa Indians, "Energy extraction activities and agricultural activities are also frequently responsible for harmful and toxic substances entering water networks such as fertilizer runoff, brine, or other chemicals. Bats have been

observed using artificial water sources, including industrial holding ponds and pits."[22] An EIS is the only way to thoroughly investigate the agricultural impacts on this federally protected species.

IV. Economic and Market Impacts

The continued expansion of Riverview raises concerns about corporate consolidation and the long-term viability of independent family farms. Increasing concentration in the dairy sector can suppress milk prices, limit market access, and reshape rural economies in ways that reduce resilience and local ownership.[23] The local community has already seen a loss of small, family dairy operations that are unable to compete with the market of inexpensive milk that is produced by an operation of this capacity.[24] Statewide, we have lost 1,300 farms in the last two years alone.[25] The economic impacts of corporate consolidation on this scale severely constrain the health and competitiveness of Minnesota's milk market.[26] The MPCA should consider these broader socioeconomic impacts as part of its environmental review, recognizing that environmental sustainability and economic fairness are deeply interconnected.

Conclusion

The expansion of the West River View Dairy operation would result in the largest confined animal feedlot operation in Minnesota with 18,855 dairy cattle. This will undoubtedly have cumulative impacts on the watershed. The impacts of an operation of this size ripple through natural water systems, including the entirety of the 130-mile long Pomme de Terre River which flows past not only the existing West River Dairy site but also Riverview's Louriston Dairy.[27]

In closing, CURE asks the MPCA to uphold its responsibility to protect Minnesota's natural resources and communities by applying rigorous scrutiny to this proposal through an EIS. The proposed climate adaptation strategies detailed in the EAW require further investigation through an EIS to determine the efficacy of the proposed adaptations.

Decisions made today will shape water quality, climate resilience, and rural livelihoods for generations. A cautious, science-based approach is not only warranted—it is essential.

Director of Environmental Stewardship

Eugene Strowbridge
Policy & Outreach Strategist

Gary Wertish, Minnesota Farmers Union **Letter 1276**

Dear Commissioner Kessler:

On behalf of Minnesota Famers Union (MFU) and responding to a vote from our Full Board, I write to request that you require an Economic Impact Statement (EIS) for Riverview LLP's permit to expand their West River Dairy in Stevens County. This scale of expansion is unprecedented in our state and we believe strongly that Minnesotans deserve a fuller examination of its environmental, economic, and social consequences.

MFU is a grassroots organization that has represented Minnesota's family farmers, ranchers and rural communities since 1918. Our membership and our Full Board include family dairies, including many who are struggling to stay in business while they shoulder prices below their cost of production. This challenge is not new with the number of Minnesota dairies declining by nearly half in the last decade, dropping from 3,470 in 2016[1] to just 1,600 farms today.[2] And while farms are declining, cows are consolidating into fewer operations. This one company is permitted for nearly a third of Minnesota's dairy herd.[3]

This consolidation has consequences not just for those families, but also for rural schools, small businesses, veterinary practices, churches, and other institutions that make life possible in rural Minnesota. According to an analysis from 2020, the average Minnesota dairy generates $1.6 million in economic activity.[4] A more complete analysis of the economic and social consequences of this project is needed.

Beyond that, we believe there are important environmental concerns that an EIS would more fully address. Our members understand that livestock projects draw water year-round and we want to ensure that we are stewarding this shared resource and safeguarding sufficient supply for neighboring farms. We also understand that consolidating livestock increases the potential consequences of a natural disaster, zoonotic disease, or human disease affecting workers.

To close, this project is different than those that are approved through our existing processes. From my memory of that time, when we established our current regulatory framework for feedlots in the late 1990s no-one contemplated a nearly 19,000 cow dairy operation. That is more than 60 times the average size herd in our state.

This project is different and deserves distinct consideration and the full public comment afforded by an EIS. If you have any questions, please contact our Government Relations Director, Stu Lourey, at stu@mfu.org or (320) 232-2047. Thank you for considering the needs and perspectives of Minnesota's farm families.

Sincerely,
Gary Wertish
President, Minnesota Farmers Union

William Pelowski **Letter 1277**

A lot of people are asserting that an EIS is unnecessary for what would be the largest cattle operation in MN.

If your teenager insists that they got all As on their report card, yet refused to show it to anyone, should we just believe them? Wouldn't they be proud of their accomplishments and be eager to show the outcome of their hard work?

It does nothing to promote trust to attempt to avoid scrutiny. There are no good reasons to skip an EIS. Moreover, the Riverview employees that submitted comments in favor of the expansion and skipping the EIS are very biased and would be unaffected by the environmental disaster. But I don't blame them. They are very likely under pressure from their employers to make these comments.

Beth Slocum **Letter 1278**

The proposed significant expansion of the existing Riverview Dairy, bringing the total number of cows to 18,855 (potentially raising the number of Animal Units to 26,397) requires a significant environmental review – a proper Environmental Impact Statement.

An EIS is the only way to insure that the people pf Minnesota can be confident that this precedent-setting expansion can be thoroughly reviewed for the potential environmental impacts on our soil, air and waters, as well as the socio-economic impacts on our family-run small dairy farms, our rural communities and our Main Street businesses.

This mega-dairy concentrates too many cows, too much aquifer-drawn water, and too much manure to be permitted without the in-depth assessment process of an EIS.

Too many cows – there is much conversation about the use of electronic data gathering on individual cows and the enhanced genetics and robotic milking that occurs 3 times a day, however, it is disturbing that a dairy CAFO of this size requires a FACILITY 16: RENDERING DEPOT. That is not a facility necessary on the small family-run dairies where every cow gets looked at twice a day – or gets a seasonal break – where the family can provide the direct assessment of each cow's demeanor and health.

And what about the air quality for the families living within 1+ miles of this giant dairy? What will be the impact of the massive amount of manure produced every day at this Riverview expansion?

Too much water – Minnesotans can be sure that the 226 million gallons of water per year required for this expansion will have a significant impact on the health of the aquifer, which is also used for private wells & irrigations wells. There is no data on the MN Dept of Ag website about well testing in the townships of Stevens County, which means there is no base line information about the flow rate or recharge rates of the private wells that could be affected by the dairy's drawn-down of water – a draw-down which is equivalent, per year, of the water use of the entire city of Morris, 5000 people.

An EIS can be used to determine how this potential use of water by Riverview could impact other water users, an essential piece of information.

The EIS review can also examine how the cost of the DNR water permitting for the profit of this dairy expansion compares to the cost of water to the city of Morris, ultimately paid by its residents.

Ultimately who will bear the costs of Riverview's water use...could it be local residents, as happened with Riverview's mega-dairy in Arizona :

"Her office (Arizona Attorney General Kris Mayes) has entered an agreement with Riverview LLP, a Minnesota-based dairy company that moved into the area over the last decade and quickly became a major driver of the Willcox groundwater basin's decline. Under the agreement, the company is agreeing to reduce its groundwater usage by fallowing 2,000 acres of land and maintaining best practices to conserve water. The company also agreed to deliver $11 million to residents affected by the company's overpumping that will pay to redrill wells, haul water and ensure the community has access to the critical resource. " https://insideclimatenews.org/news/10012026/arizona-agreement-with-dairy-farm-to-cut-groundwater-pumping/?emci=965383e4-2014-f111-a69a-000d3a57593f&emdi=e81935b0-a116-f111-a69a-000d3a1f0a97&ceid=2641375

Too much manure -- 18,855 cows will produce approximately 285,000 gallons per day –for a total of 202,744,000 gallons per year. Where will that manure go?? So far, the manure application maps show that all the fields included in the manure application plan are within one township – Synnes in Stevens County. There certainly is a problem with millions of gallons of manure application in such a small area – application that is limited by season, weather conditions and truck travel. How can it be possible to spread these millions of gallons of manure in a timely fashion? In appropriate ag rates? Who will supervise all that data? What will happen when adverse conditions require emergency drawdowns of manure in storage?

How many trucks will it take to haul all that manure? How many miles over township and county and state roads will that require? Who will pay those costs? Again, the folks who will profit from this operation will not bear the cost of road maintenance, nor the consequences of manure that must be spread unseasonably.

An EIS is required to answer these questions and to insure that all worst case scenarios can be mitigated.

Manure storage is a crap shoot – pardon the pun – and even if "covered" can pose serious health concerns to local residents. Lined concrete pits with covers have a certain half-life. "Concrete..., as told me by someone who actually builds manure pits, " is new or it's leaking."

Noxious, toxic gases are produced in those storage pits and seep into the air – and charge into the surrounding air when the pits are stirred. Here's the problem...

"Manure pits that hold livestock and poultry waste give off foul-smelling toxic air pollutants that can be deadly to farmworkers and local residents, who often are powerless to defend the health of their families from the noxious emissions."

https://www.ewg.org/news-insights/news/manure-pits-emit-deadly-pollutants

Having been part of a data-gathering group monitoring emissions from a local hog barn with a buried pit, I can, from experience, say with certainty that emissions occur. And in dairy barns they occur when barns and milking parlors are cleaned and manure moved to storage lagoons, where all those millions of gallons wait...

An EIS will give local folks a chance to understand the impact of the expansion on air quality and their health.

Too much manure spread in a small area also leads to water contamination, and with no baseline water testing in the townships of Stevens County and Synnes Township, in particular, local residents with private wells will have no baseline of nitrate testing to insure that their water is healthy to drink. It seems imperative that the MN Dept of Ag proceed with well testing and MPCA proceed with an EIS.

Benefits? Really? An EIS will tell.

The proposers suggest that there will be 40 jobs -- "40 families"-- coming with this expansion, but if you think about who really works on these CAFO sites, most are immigrant men, only a few of whom bring their families from their country of origin. These will not be farm families that can contribute to multiple local and Main Street businesses:

"...family-scale dairy farms can have a far larger positive economic impact in local communities. That's because they support a broad network of local businesses, from veterinarians and feed suppliers to equipment dealers and milk haulers. When these farms disappear, those economic benefits are lost. Research shows that larger industrial-scale operations tend to spend less locally, concentrating economic activity rather than distributing it across rural communities."

Land Stewardship Project Myth Buster, December 2019, "Myth: Mega-Dairies = Mega-Benefits for Rural Communities," https://landstewardshipproject.org/repository/1/3116/myth_buster_56_mega_dairy.pdf

And here's something to think about... do we really want to be the home base to the 5th largest global dairy:

"Mega-scale dairy farms are primarily concentrated in China, Saudi Arabia, Russia, the United States, and Southeast Asia. These regions combine access to capital, land, and regulatory frameworks that allow this model of scale.

Rank Farm / Farm Group Country Raw milk production (t/year)
1 Mudanjiang Mega Dairy Farm China ≈2,000,000
2 Almarai Saudi Arabia ≈1,470,000
3 Modern Dairy China ≈1,280,000
4 EkoNiva Russia ≈1,200,000
5 Riverview LLP USA ≈800,000–1,000,000
6 Rockview Family Farms USA ≈1,000,000
7 Huishan Dairy China ≈800,000
8 Al Safi Dairy Farm Saudi Arabia ≈550,000
9 Greenfields Dairy Farm Indonesia ≈400,000–450,000
10 Fair Oaks Farms USA ≈350,000–400,000

Why are European dairy farms absent from the global top 10 ranking?

One outcome of this ranking is the absence of European Union dairy farms from the global Top-10. This is not due to missing data, but to structural differences in production models.

European dairy farming is dominated by family-owned farms, operating under strict environmental, animal-welfare, and land-use regulations. Scale is achieved primarily through cooperative aggregation, rather than through ultra-large, centrally owned farms. As a result, even Europe's largest individual farms fall well below the production thresholds required for inclusion in a global Top-10 ranking based on raw milk output per farm. Nonetheless, the EU's dairy sector is highly efficient and will be addressed in future articles."

https://ruminants.ceva.pro/global-dairy-production

Maybe we want to think about our first model – "family-owned farms... through cooperative aggregation" :

"In 1890, the Danish American community in Clarks Grove established one of the first cooperative creameries in Minnesota. The Clarks Grove Cooperative Creamery used new technology and a well-organized cooperative system. It became a model for the Minnesota dairy industry. Ten years later, there were more than 550 cooperative creameries in the state."

https://www.minnpost.com/mnopedia/2015/06/banding-together-better-butter-clarks-grove-was-one-minnesota-s-first-cooperative-c/

So many questions can be answered by an EIS.

So much more information can be gained by an EIS.

Clearly we need an EIS for this Riverview Dairy expansion proposal.

Thank you.
Beth Slocum

Kristin Lamberty **Letter 1279**

I am concerned about the potential negative impact this expansion would have on our local environment. I don't feel like there has been enough information gathered about how this expansion would impact the lives of people living nearby or the overall ecosystem in which it would be located.

I am opposed to this expansion happening without further study.

Ron Visser **Letter 1280**

Riverview is good for the dairy industry in Minnesota. I have watched the dairy industry exist the far north of Minnesota, nearly all of North Dakota and the Black Hills area of South Dakota. I have watched the dairy industry take off in part of Idaho, Texas, Indiana, South Dakota and currently in Kansas. The traditional heavy dairy areas of the Midwest and Northeast have had a transition away from small tri-stall barns to the addition of longer free stall barn. This will likely continue in these areas. The harsh reality is the areas that are losing cows are smaller farms. The areas that are gaining cows add larger farms. The traditional cow areas have a similar dynamic. Making large dairy permitting difficult or impossible, will only harm the dairy industry in Minnesota and move it somewhere outside of Minnesota. Making it easier to permit a dairy in Minnesota will improve the entire industry. The dairy industry is the dairy farms along with the processing, veterinarians, nutritionists, ag lenders-dairy, diary shipment dealers/repairs, etc. that go with it. Riverview helps keep all of this in the state of Minnesota. I support the Riverview West River expansion. I feel like the plan is good and no EIS is needed.

Aloriberto Vite **Letter 1281**

I support West Riverview expansion

No EIS Required

Jose Luis Quinter **Letter 1282**

I support west River expansion

Jose Luis Martinez **Letter 1283**

I support the West Riverview expansion.

John H Beste **Letter 1284**

ATTN: Charles Peterson

My name is John Beste, and I am the owner of Famo Feeds Inc., a Livestock Feed manufacturing business serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,
John Beste
President
Famo Feeds Inc.

Lee Ann Hall **Letter 1285**

My name is Lee Ann Hall. I am a Norman County Commissioner in Minnesota. This is my 24th year in that elected position. I also owned an Office Supply/Technology Center in Ada, MN for over twenty years. I recently sold my business as part of my retirement process. I am also a board member of the Norman County Economic Development Authority and the Secretary/Treasurer of the Ada Chamber of Commerce.

I am writing in support of the proposed West River Dairy expansion in Stevens County. I have experienced firsthand the positive impact that Riverview/Waukon Dairy has had to the vitality and economics of Norman County, the Ada community, local businesses and our local farmers. Their operation located in Waukon Township has had a huge economic impact! They are dedicated to the local community and businesses in our County. They buy local, they fixed up an old apartment facility in Twin Valley during their construction process and turned it into an asset for the community, partnered with local farmers in buying from them direct for products needed and selling to them direct for different needs that they have on the farms and so much more! Riverview/Waukon Dairy has built a strong stable livestock business that creates consistent economic activity that supports local jobs and allows businesses for flourish and grow. The dairy has been a great neighbor to the surrounding farmers. They run a clean, efficient and necessary business in Norman County. As a Commissioner, I have heard nothing but great things about their operation and their commitment to work with our local farmers and communities. They are involved in many community events and also donate things like ice cream, cheese and help by volunteering to enhance the events.

The management of the Dairy has been a great partner, attending the Norman County Board meetings to give us updates while they were building the Dairy and after on updates with their Dairy operation. They also have attended the Norman County EDA meetings to keep us updated. They welcome tours of their facility with open arms and encourage people to check them out. We appreciate their willingness to be transparent and keep us "in the know."

The proposed expansion will bring a huge economic benefit to Stevens County by generating demand for local vendors, support construction and employment and add to the vitality of County. These types of projects are essential to maintaining a sustainable economy in rural Minnesota. The Norman County EDA works hard to get new businesses into our County. We were so excited and blessed that they considered and put their operation on our rural county!

No EIS is needed as the State Environmental Review process is rigorous and sufficient. I respectfully encourage your support and approval of this important project.

Sincerely,
Lee Ann Hall

Jaylon Nichols **Letter 1286**

I trust Riverview Way more than small dairy farmers when it comes to operating and upholding integral business practices. Their people and culture are unmatched. They have provided so much opportunity for me and my family, and I have never witnessed management purposely put profit over integral business practices.

Brady Janzen, Riverview, LLP **Letter 1287**

Dear Mr. Peterson,

For over 50 years, Riverview has successfully and responsibly operated regulated feedlots in Minnesota. As a feedlot permittee, Riverview has completed numerous Environmental Assessment Worksheets (EAWs) as part of Minnesota's rigorous environmental review process. The West River Dairy expansion EAW stands as the most comprehensive to date. The EAW process is designed to determine whether an environmental impact statement (EIS) is required for a proposed action. An EIS is prepared when there is a potential for significant environmental effects. As detailed below, the only reasonable conclusion based on the evidence developed after a thorough review is that this proposed project does not have the potential for significant environmental effects. Thus, we do not believe that further analysis through an EIS is warranted.

We thank the Minnesota Pollution Control Agency (MPCA), Department of Natural Resources (DNR), and other state agencies for their diligent work and for the opportunity to comment on this EAW. We offer the following information to address various comments and questions raised with respect to the project over the last few months.

I. Comprehensive Greenhouse Gas Accounting

The project's anticipated emissions are accounted in detail in the EAW, including differences between construction and operational emissions. Construction emissions encompass land conversion, transportation, as well as the use of stationary and mobile equipment during the building phase. Operational emissions include two kinds: Scope 1 direct emissions, and Scope 2 indirect emissions. Scope 1 emission sources include enteric fermentation, methane, and nitrous oxide released from the

barn and manure storage; nitrous oxide from land application; and combustion from stationary and mobile equipment. Scope 2 emissions account for the project's electricity consumption.

The EAW also addresses the project's relationship to the Minnesota Next Generation Energy Act goals. While the project will generate a certain amount of GHG emissions, overall emissions in Minnesota have declined approximately 14% since 2005. It is also worth highlighting that the Food and Agriculture Organization of the United Nations found that North American dairies are the most efficient in the world. In fact, North American dairies reduced absolute emissions by 5% while increasing milk production over a 10-year period.[1] And a peer-reviewed study published in the Journal of Animal Science found that the total carbon footprint of the U.S. dairy industry in 2007 was 41% lower than in 1944, even as total milk production increased by 59%.[2] On a per-unit basis, the carbon footprint per kilogram of milk produced in 2007 was only 37% of the 1944 level. Modern dairy practices required only 21% of the animals, 23% of the feedstuffs, 35% of the water, and 10% of the land needed to produce the same quantity of milk as in 1944. These improvements have continued: a follow-up study by the same researchers found that between 2007 and 2017, GHG emissions per unit of energy-corrected milk declined by an additional 19.2%, even as total U.S. milk production increased by 24.9%.[3] Minnesota's total dairy cow herd has declined from roughly 1.2 million head in 1960 to approximately 440,000 today. This logically demonstrates that Minnesota's dairy industry is producing the lowest level of GHG emissions at any point in its history. As global demand for dairy products increases,[4] Minnesota has an opportunity to lead in supplying that demand, and doing so in a way proven to have the lowest impacts on the environment.

Finally, the EAW highlights several opportunities in which emissions will be mitigated and/or reduced. The project will convert thousands of acres from row crops to alfalfa production (reducing approximately 1.21 tons of CO2e annually per acre), promote the use of cover crops, and offset reliance on synthetic fertilizer through organic manure application. Additional mitigation strategies, as described in the EAW, include the use of efficient Holstein-Jersey crossbred genetics, feed additives, variable frequency drives on motors and milking equipment, temperature-regulated ventilation and misting systems, LED lighting, plate cooler heat recovery, and the potential purchase of renewable electricity from the utility provider.

II. Sustainable Water Supply and Ongoing Compliance

Strategies to achieve a diversified and sustainable water supply plan are meticulously described throughout the EAW. Rather than seeking a new groundwater appropriation, Riverview will utilize an existing off-site well that was previously permitted for 452 million gallons per year, an amount that was previously found by MN DNR to be sustainable from this aquifer. Through a pending permit with the DNR, Riverview will reduce the appropriated volume by half, requesting only 226 million gallons per year. The original appropriation was granted after the completion of an aquifer test. The results of the aquifer test confirmed that the water-table aquifer can sustain the requested volume. The aquifer test also identified a hydraulic connection between the off-site well and the Pomme de Terre River,

[1] "Climate Change and the Global Dairy Cattle Sector: the role of the dairy sector in a low-carbon future." Food and Agriculture Organization of the United Nations. 2019. https://www.fao.org/3/CA2929EN/ca2929en.pdf
[2] Capper, J.L., R.A. Cady, and D.E. Bauman. "The Environmental Impact of Dairy Production: 1944 Compared with 2007." Journal of Animal Science 87, no. 6 (2009).
[3] Capper, J.L. and R.A. Cady. "The Effects of Improved Performance in the U.S. Dairy Cattle Industry on Environmental Impacts Between 2007 and 2017." Journal of Animal Science 98, no. 1 (2020).
[4] U.S. Dairy Export Council, International Demand Analysis (Data Through January 2026), available at https://www.usdec.org/economics-and-data/international-demand-analysis.

prompting the DNR to include groundwater appropriation restrictions based on river flow. These restrictions are responsive to, and will protect, surface water resources.

This hydraulic connection between the river and the aquifer is important for another reason: it represents a source of aquifer recharge. Given that, it's important to note that last year alone 120 billion gallons of water flowed past a nearby stream gage on the Pomme de Terre River.[5] West River Dairy's proposed appropriation represents 0.18% of that measured volume. Although West River will not be appropriating river water, knowing that the aquifer from which it will be appropriating has recharge connectivity to this volume of river water provides good perspective. With this perspective, it's easy to see why a groundwater appropriation volume that is double the currently-proposed amount was previously found to be sustainable in this location, and why the currently-proposed amount does not represent a potentially significant environmental impact.

Some commenters have compared the project's water use to the volume used by the nearby City of Morris, implying that the project poses a risk to the city's water supply. This comparison is not indicative of any potential environmental impact. The off-site well to be used for the West River Dairy expansion is located several miles downstream from the City of Morris's wells along the Pomme de Terre River. Because the water-table aquifer in this area is recharged by the Pomme de Terre River, the downstream position of the project's well means that any water use by West River Dairy would have no impact on the water supply available to the City of Morris, especially in light of the river flow restrictions to be imposed by DNR. This conclusion is further supported by the aquifer test conducted on this well, which found that significant interference is not expected to occur in any existing water wells. Additionally, a historic flow study of the Pomme de Terre River conducted by Moore Engineering found that stream flows have been materially increasing since 1991. This increasing trend in river flows—likely correlated to drainage improvements within the watershed—further supports the conclusion that adequate recharge exists for water appropriations from the Pomme de Terre River valley and reduces the likelihood that pumping restrictions would ever be required. It is also worth noting that the DNR's Groundwater Province Map indicates that groundwater availability is moderate to good in the surficial sand aquifers in this area. Finally, we are not aware of any evidence indicating hydrologic connectivity between the off-site well and the on-site wells at the existing dairy, which are screened in different aquifers. As noted above, the aquifer test report confirmed that significant interference is not expected to occur in any existing wells.

Furthermore, as a contingency and climate adaptation strategy, the project will also construct two water storage basins designed to hold a nine-month supply of water. These basins will allow the appropriation and storage of water when river flows are high and provide a buffer should groundwater appropriation ever need to be curtailed due to lower river flows. In addition, West River Dairy will offset groundwater needs by capturing and recycling rainwater from the farm itself. In total, the farm will be engineered to capture approximately 90 million gallons of rainwater annually (on average). All these features and strategies result in a diversified and sustainable approach to the project's water needs while reducing reliance on a single water source.

What's more, West River Dairy's water appropriation is subject to permitting and ongoing regulation by the DNR. When determining whether a project has the potential for significant environmental effects, the responsible governmental unit (RGU) shall consider the extent to which the environmental effects are mitigated by ongoing public regulatory authority. Minn. R. 4410.1700, subp. 7 (emphasis added). The West River Dairy expansion must obtain a groundwater appropriation permit from the DNR and is

[5] Minnesota Department of Natural Resources. "Cooperative Stream Gaging (CSG)." https://www.dnr.state.mn.us/waters/csg/index.html

therefore subject to the DNR's ongoing public regulatory authority. According to Minn. Stat. § 103G.287, subd. 5, a groundwater appropriation permit may be granted only if DNR determines that the use is "sustainable to supply the needs of future generations and the proposed use will not harm ecosystems, degrade water, or reduce water levels beyond the reach of public water supply and private domestic wells…."[6] Thus, by law, the DNR cannot issue a permit for West River Dairy's expansion if it determines that the water resources proposed to be used are not adequate, which eliminates the potential for significant environmental effects from water appropriation. Further, once issued, ongoing compliance frameworks — including water level monitoring, annual reporting, and enforceable pumping restrictions — remain in place to ensure continued protection of the state's water resources. And Minn. Stat. § 103G.261 prioritizes domestic water supply above all other uses.

Minnesota courts support an RGU's reliance on ongoing public regulatory authority when measures exist that are specific, targeted, and certain to be able to mitigate the environmental effects in question. Citizens Advocating Responsible Development v. Kandiyohi County Board of Commissioners, 713 N.W.2d 817, 834-35 (Minn. 2006). The DNR's permit measures clearly meet these criteria. Importantly, the Minnesota Court of Appeals has stated that the DNR water appropriation permit process is a sufficient means of preventing and mitigating significant environmental effects. In re Environmental Impact Statement, 849 N.W.2d 71, 82 (Minn. Ct. App. 2014); see also Friends of Twin Lakes v. City of Roseville, 764 N.W.2d 378, 382 (Minn. Ct. App. 2009). The Court of Appeals has also held that MPCA deferral to the DNR's permitting process in a nearly identical scenario was proper. See Matter of Decision on Need for an Env't Impact Statement for Proposed Barrick Fam. Farms, LLP - Lockhart 25 Project Lockhart Twp. Norman Cnty., 2021 WL 3716643, at *6 (Minn. Ct. App. Aug. 23, 2021) ("[B]ecause of the rigorous review process and strict statutory protections …, the MPCA could properly defer review of the potential impacts … to the DNR's permitting process.")

Considering the foregoing, MPCA must consider DNR's regulations with respect to water appropriation, and it's reasonable and proper to conclude that these regulations are sufficient to prevent the potential for significant environmental effects.

III. Stormwater Management

The project's stormwater management plan further demonstrates a commitment to climate adaptation. As described in the EAW, the project's stormwater basins are sized at least 20% larger than the minimum required for a 25-year, 24-hour precipitation event to account for projected increases in rainfall frequency and intensity. In practice, the oversizing is even greater: the two long-term water storage basins being constructed as part of this expansion provide an additional 157 million gallons of storage capacity. Stormwater captured in the on-site stormwater basins can be transferred to these long-term water storage basins, where this captured rainwater will be stored for recycling/reuse as a water supply for cattle. Together, these water storage basins provide several times the amount of required stormwater capacity. This layered approach to stormwater management thoroughly mitigates and eliminates any concerns regarding stormwater basin capacity, even under the most severe projected climate scenarios.

IV. Minnesota's Robust Permitting Process and the Project's Draft Individual Permit

The West River Dairy expansion will be governed by a "zero discharge" Individual National Pollutant Discharge Elimination System (NPDES) feedlot permit that imposes site-specific requirements, more stringent than those of the state's general feedlot permit. The dairy is designed so that no discharge of

[6] See also, Minn. R. 6115.0670 (providing that permits may not be issued if the water resources are not adequate or if " the appropriation is not reasonable, practical, and does not adequately protect public safety and promote the public welfare").

manure or process wastewater from the farm will occur. Further, among the more stringent provisions of the draft individual permit are earthen manure storage basins with clay liners more than twice as thick as those required under the general permit, additional notification requirements during construction of manure storage areas, mandatory agency approval before manure storage areas can be used, and notification requirements when land application of manure begins. None of these requirements are part of the general feedlot permit, under which most feedlots operate.

Additionally, as described in the EAW, the land application of manure is managed and regulated according to plans that are part of the NPDES permit designed so that the nutrients found in the manure are used in crop production and not lost to waterways. This includes soil testing, manure testing, agronomic rate requirements, etc. The application areas for the West River Dairy expansion were also carefully selected and evaluated to avoid and mitigate environmental effects, and more than enough acres are available to handle the manure that will be produced.

Moreover, the MPCA's own literature review of manure application runoff studies confirms that the incorporation of manure into soil—the method proposed to be used at West River Dairy—reduces runoff volume, soil loss, and nutrient transport compared to fields that did not receive manure. Importantly, the injection of liquid manure—consistent with the knife-injection method Riverview employs—resulted in greater reductions.[7]

V. Dairy Farm Trends

Some commenters have suggested that this project should be evaluated in light of economic trends within the dairy industry. The purpose of an EAW is to assess potential significant environmental effects—not to serve as a vehicle for broader economic policy debates.

Even setting that aside, the data does not support the argument that larger-scale dairy farming is causing other farms to exit the industry. Dairy farms have been declining in Minnesota since at least the 1940s. According to USDA Agricultural Census data, approximately 90% of the dairy farms that have exited Minnesota since 1940 had done so by 1992—well before large-scale dairy farming existed in the state. Since the emergence of larger dairy farms in the early 2000s, the rate of decline in farm numbers has continued largely unchanged, while Minnesota's dairy herd numbers have stabilized. Similar trends of farm declines have been even more pronounced in neighboring North Dakota, where large-scale dairy farming does not exist to any meaningful degree, yet dairy farm numbers have declined even more dramatically. These facts suggest that other factors—not farm size—are the primary drivers of dairy farm exits. Meanwhile, demand for dairy products continues to grow both domestically and internationally, with approximately $10 billion invested in U.S. dairy processing capacity recently and significant new processing investments in the upper Midwest region. This growing demand represents an opportunity for Minnesota's entire dairy industry, and projects like the West River Dairy expansion help sustain the milk supply that supports regional processors, which in turn benefits dairy producers of all sizes.

VI. Conclusion

The West River Dairy expansion EAW is a thorough document that demonstrates the proposed project has been carefully designed to avoid, minimize, or mitigate potential environmental effects. It is also clear that the regulatory framework governing the project provides robust and ongoing environmental protection. Riverview appreciates the work of the MPCA, DNR, and other agencies involved in this process and is confident in Minnesota's environmental review and permitting process. We respectfully

[7] "Runoff Reductions with Incorporated Manure." Minnesota Pollution Control Agency. May 2018. Publication wq-f1-08.

urge the MPCA to follow the process established in law and issue a negative declaration on the need for an Environmental Impact Statement.

Sincerely,
/s/ Brady Janzen

Authorized Partner, Riverview, LLP

Blaine Hill **Letter 1288**

To whom it may concern. I grew up in Morris and recently retired as the city manager here. I'm writing in support of the West River Dairy expansion project. I believe that Minnesota has some of the best, if not best regulations in the world when it comes to protecting the environment and our natural resources. I've had the opportunity to work with the state on many projects as a city manager and I've had the opportunity to work with local companies like Riverview as they continued to grow. I'm a grandfather now and have the opportunity to watch grandchildren and as I drive back and forth from Hancock to Morris, I'm amazed at the quality of the operations that are taking place with regards to the farmland. This includes the process of distribution of manure from Riverview Dairy. I worry about our water, land and air resources like everyone else. I believe Riverview Dairy knows and understands the importance too and quite frankly this is their home like it is mine. They are good people and will do the right things and I know and understand that the MPCA, DNR and other state agencies are good at their jobs. Together we will all be better moving forward. I'm here like they are because our ancestors immigrated to this area to begin a new life farming land they were given. Some made it, some didn't. These are the ones that made it and it is because of the way they do business. I did not grow up on a farm but my friends did and I had the chance to work on farms as a young high school kid. I love where I live. I like what Riverview Dairy is doing. Again I'm writing in support of their project. Thank you.

Eric Lindberg, Minnesota Center for Environmental Advocacy **Letter 1289**

Comments on the Environmental Assessment Worksheet

for the West River Dairy Expansion

May 7, 2026

INTRODUCTION

Agribusiness giant Riverview, LLP ("Riverview") is the largest dairy farming company in Minnesota, the second largest in the United States, and the fifth largest in the world.[1] Riverview's proposed West River Dairy Expansion project (the "Expansion Project") in Stevens County would be the largest dairy Concentrated Animal Feeding Operation ("CAFO") in Minnesota, if approved. The Expansion Project would swell the existing West River Dairy 7,855-cow facility by adding 11,000 dairy cows to a total of 18,855 dairy cows (26,397 animal units). The 15,400 animal units added by the Expansion Project—

[1] MILICA KOCIC & TORSTEN HEMME, IFCN DAIRY RSCH . NETWORK , IFCN TOP-10 LIST: DAIRY FARMING COMPANIES WORLDWIDE 2020 (2020), https://ifcndairy.org/wp-content/uploads/2020/02/IFCN-Top-10-List-Dairy-Farming-Companies-Worldwide-2020.pdf [Exhibit 1] (listing Riverview as the fifth largest dairy company worldwide by number of cows and fourth largest by production of raw milk); see also Ana Sofia Santos, Global Dairy Production: *Top 10 Largest Dairy Farms in the World*, CEVA SANTÉ ANIMAL (Jan. 21, 2026), https://ruminants.ceva.pro/global-dairy-production [Exhibit 2] (ranking Riverview as the fifth largest dairy farming company worldwide by raw milk production and the largest in the United States).

standing alone—would be the second largest CAFO by total animal units in Minnesota. The expanded West River Dairy would be the largest CAFO in the State.[2]

There are multiple reasons why the Minnesota Pollution Control Agency("MPCA") should conclude that Riverview's Expansion Project has the potential for significant environmental effects. First, the Environmental Assessment Worksheet("EAW") acknowledges that the Expansion Project would add at least 72,000 tons of greenhouse gas ("GHG") emissions annually to the existing West River Dairy facility.[3] Yet the EAW fails to fully (1) account for its full GHG emissions footprint, (2) consider the impacts of those emissions, and (3) consider alternate ways to mitigate those emissions. Even with the incomplete information contained in the EAW, the MPCA should recognize the potential for significant environmental effects and order an Environmental Impact Statement ("EIS") to further examine those effects. Fully assessing the GHG emissions of the Expansion Project is especially important because the agriculture sector is the second largest source of GHG emissions in Minnesota, responsible for approximately 25% of the State's net emissions.[4]

Second, the EAW's assessment of water availability relies upon an aquifer test that is nearly two decades old, and the EAW fails to consider the water quality impacts attendant to appropriating over 200 million gallons of water per year from an aquifer hydrologically connected to the Pomme de Terre River. Third, the EAW's plan to protect water quality from the massive amount of manure the Expansion Project will add to the Pomme de Terre River Watershed is inadequate. The EAW's cumulative effects analysis does not recognize the poor water quality already existing in this part of Minnesota and how the Expansion Project will exacerbate the problem. The EAW must include a full assessment of the cumulative effects of applying so much additional manure to fields in a region where surface waters are already impaired with agricultural pollutants. Finally, the EAW entirely fails to assess one of the largest impacts the Expansion Project will have on Minnesota. Riverview's massive size and scale has distorted Minnesota's dairy market, driving out small and mid-sized producers. This is a major environmental effect the EAW entirely overlooks and one MPCA should study through an EIS

I. STATUTORY AND REGULATORY BACKGROUND

Under the Minnesota Environmental Policy Act ("MEPA"), a responsible governmental unit ("RGU") conducting an EAW review must consider all impacts "that may be reasonably expected to occur from the project" to determine whether the Expansion Project has "the potential for significant

[2] Minn. Pollution Control Agency (MPCA) & Minn. Geospatial Commons, Feedlots in Minnesota, https://gisdata.mn.gov/dataset/env-feedlots (last visited May, 5, 2026).

[3] The original Environmental Assessment Worksheet (EAW) for the Expansion Project estimated a total of 66,324 tons of greenhouse gas (GHG) emissions annually—about 9% less than the current estimate. The revised estimate likely increased because the revised feedlot GHG calculation applied MPCA's standard dairy-cow manure-calculation liveweight of 680 kg/head, or about 1,500 lb/head, rather than the 1,200 lb/head average weight reflected in West River Dairy's Manure Management Plan. *Riverview's EAW for West River Dairy, infra* note 17, at Attachment 23. Because manure CH_4 and N_2O calculations scale directly with animal liveweight under MPCA's methodology, the manure-related emissions increased 5,886 tons CO_2e/year. The revision demonstrates that the EAW's GHG estimate is highly sensitive to animal liveweight assumptions. However, the EAW contains inconsistent liveweight assumptions—approximately 1,500 lb/head in the revised GHG calculation, 1,400 lb/head in animal-unit accounting, and 1,200 lb/head in the Manure Management Plan. MPCA should require Riverview to reconcile these assumptions, disclose the expected actual average liveweight of the Holstein–Jersey crossbred herd, and confirm that manure generation, nutrient loading, storage capacity, land-application acreage, enteric methane, and fertilizer-offset calculations are all based on consistent livestock characterization. Given that a single assumption change increased annual emissions by nearly 6,000 tons CO_2e/year, additional sensitivity analysis and verification is warranted.

[4] ANNE CLAFLIN ET AL., MPCA, GREENHOUSE GAS EMISSIONS IN MINNESOTA 2005-2022 at 9 (2025), https://www.pca.state.mn.us/sites/default/files/lraq-3sy25.pdf [Exhibit 3; hereinafter "MPCA GHG EMISSIONS IN MINNESOTA"].

environmental effects."[5] The agency must take a "hard look" at the issues involved, and "genuinely engage[] in reasoned decision making."[6] The Minnesota Court of Appeals explained that, in order to determine whether a project has the potential for significant environmental effects, the environmental review process must include an analysis of environmental impacts "reasonably expected" to occur, even if not contemplated on the EAW form.[7] The Minnesota Environmental Quality Board ("EQB") and MPCA have adopted guidance requiring all project applicants to complete an environmental study on, for example, their expected GHG emissions and whether they have considered ways to reduce those emissions.[8]

Serious consideration of GHG emissions in environmental review processes aligns with Minnesota law and policy, which, since 2007, has called for steep reductions in GHG emissions throughout the State "across all sectors producing greenhouse gas emissions."[9] Yet, the agricultural sector's emissions have actually increased. Minnesota's 2007 Next Generation Energy Act acknowledges the threat that GHG emissions pose to public health and welfare by setting State goals to reduce statewide GHG emissions, with an ultimate goal of achieving net-zero emissions by 2050.[10] Unfortunately, Minnesota has fallen short both of its 2015 goal to decrease GHG emissions 15% below the 2005 baseline, and its 2025 goal of a 30% decrease.[11] The agricultural sector is particularly off-track: unlike other sectors, such as electricity generation and transportation, which have seen reduced emissions since 2005, emissions from agriculture increased 1% between 2005 and 2023.[12]

MPCA's reporting shows that the agriculture sector is the second largest source of GHG emissions in the State, responsible for approximately 25% of net emissions.[13] Animal agriculture is the largest source of methane in Minnesota, with the methane coming mainly from cattle digestion and manure storage, and a significant portion of the agriculture sector's nitrous oxide emissions stem from manure management

[13] MPCA GHG EMISSIONS IN MINNESOTA, supra note 4, at 9.

and growingfeed for livestock.[14] Minnesota will not meet its GHG emission reduction goals without addressing emissions from massive feedlots like the one proposed.[15]

There are other serious environmental risks from the Expansion Project. The massive amount of water the Expansion Project needs and the manure produced by the additional 11,000 cows risk further degrading water quality and other natural resources in the Pomme de Terre River Watershed. And Riverview's rapidly expanding hoofprint is changing rural Minnesota, driving out small and mid-sized dairies who are unable to compete.

To comply with the law and Minnesota public policy, MPCA must consider whether the Expansion Project has the potential to cause significant environmental effects based on the following criteria, set out in Minn. R. 4410.1700, subp. 7:

A. type, extent, and reversibility of environmental effects;

B. cumulative potential effects, including:

   i. whether the cumulative potential effect is significant;

   ii. whether the contribution from the project is significant when viewed in connection with other contributions to the cumulative potential effect;

   iii. the degree to which the project complies with approved mitigation measures specifically designed to address the cumulative potential effect; and

   iv. the efforts of the proposer to minimize the contributions from the project;

C. the extent to which the environmental effects are subject to mitigation by ongoing public regulatory authority. The RGU may rely only on mitigation measures that are specific and that can be reasonably expected to effectively mitigate the identified environmental impacts of the project; and

D. the extent to which environmental effects can be anticipated and controlled as a result of other available environmental studies undertaken by public agencies or the project proposer, including other EISs.[16]

This comment will show that, applying these criteria, there is the potential for significant environmental effects from the proposed Expansion Project. Consequently, MPCA must order an EIS.

II. MPCA MUST ORDER AN EIS BECAUSE THE EXPANSION PROJECT'S GHG EMISSIONS HAVE THE POTENTIAL FOR SIGNIFICANT ENVIRONMENTAL EFFECTS

The Expansion Project's GHG emissions easily clear the threshold for a full EIS. Riverview's own estimate shows a net increase of 72,210 tons of CO_2e per year and approximately 2.17 million tons of CO_2e over the Expansion Project's 30-year life, primarily from enteric fermentation and manure storage. But that estimate is not the outer bound of the Expansion Project's climate impact; it is likely an understatement.

[14] Id. at 3, 10; Minnesota Greenhouse Gas Inventory, Sector-Level Details, Agriculture Sector, MPCA, https://data.pca.state.mn.us/views/Greenhousegasemissionsdata/Sectordetails (last visited May 5, 2026) [Exhibit 6, hereinafter "MPCA GHG Inventory: Agriculture Sector Details"]. Minnesota is comparable to the rest of the nation in this respect. Animal agriculture is the largest agricultural emitter in the United States: nearly 80% of U.S. agriculture emissions are from the production of animals for food and their feed. PETER H. LEHNER & NATHAN A. ROSENBERG , FARMING FOR OUR FUTURE: THE SCIENCE, LAW, AND POLICY OF CLIMATE-NEUTRAL AGRICULTURE 43 (2021) [Exhibit 7].

[16] Minn. R. 4410.1700, subp. 7.

The EAW relies on conservative inventory-based modeling, analyzes methane only under a 100-year global warming potential ("GWP"), omits or selectively accounts for substantial lifecycle and scope 3 emissions, and claims mitigation credits that are indefinite, unsupported, or overstated. At the same time, the Expansion Project's emissions must be evaluated against Minnesota's persistently high and increasing agricultural methane and nitrous oxide emissions, the cumulative nature of climate harm, and the absence of any meaningful regulatory program that will cap, monitor, or reduce feedlot GHG emissions after approval. Taken together, the type, extent, irreversibility, cumulative effects, inadequate mitigation, and lack of regulatory control all demonstrate that the Expansion Project has the potential for significant environmental effects and that MPCA must order an EIS.

A. The Type, Extent, And Irreversibility Of The Expansion Project's GHG Emissions Weighs Strongly In Favor Of An EIS

According to Riverview, the West River Dairy Expansion creates "a net increase of 72,210 CO2 e [tons] per year in GHG emissions, primarily from livestock digestion (enteric fermentation), and manure storage."[17] The "total net GHG emissions during the life of the [West River Dairy Expansion] (~30 years), including the construction and operation phases, is estimated to be 2.17 million tons CO_2e."[18] For comparison, a recent EAW estimates that the total construction and operation emissions of a 287,000 square foot rare-earth magnet manufacturing facility is 1.68 million tons CO_2e over a 50-year period.[19] Riverview's estimate reflects substantial GHG emissions at levels that weigh in favor of further environmental review.

While even Riverview's estimate describes exceptionally high emissions, the EAW likely understates the extent of the Expansion Project's GHG emissions. The EAW uses the MPCA calculator, which in turn relies on models adopted from the U.S. Environmental Protection Agency ("EPA"). The underlying methodology results in conservative estimates, including because the methodology requires assumptions and extrapolations based on representative systems.[20] Compared to models of carbon dioxide emissions from the fossil fuel industry, the EPA's models of nitrous oxide and methane emissions from agriculture are considered far less certain, and the resulting estimates have wide confidence intervals.[21] According to experts, the range of uncertainty between the upper and lower bounds of U.S. agricultural emissions equates to the annual emissions of more than 100 coal-fired power plants.[22]

This high degree of uncertainty is due in part to the use of an inventory-based, "bottom-up" approach, which involves multiplying the number of animals present by "emissions factors" specific to animal types and regions (i.e., estimates of how much gas is produced by each animal over a set period of time).[23] These emission factors are typically derived from controlled studies, representative farm systems, or

modeled averages, and are then applied broadly across diverse real-world operations. As a result, the approach simplifies complex biological and environmental processes—such as feed composition, animal health, manure handling, weather conditions, and management practices—into standardized assumptions. Since this "bottom up" approach requires many inputs—each with its own uncertainty—the resulting uncertainty of the total emissions estimate can be more than that of any individual input.[24]

The alternative to a "bottom-up" approach is a "top-down" approach, which uses atmospheric measurements from livestock production regions to produce emissions estimates or corroborate a model's emissions estimates. One comparison of bottom-up and top-down estimates found that animal methane emissions in the U.S. may be 39% to 90% higher than bottom-up studies predict.[25] This may be because bottom-up models like that used by the EPA and adopted by MPCA fail to account for animal diseases that increase enteric fermentation and rely on manure emission factors that are based on laboratory experiments, rather than real-world settings.[26] The Expansion Project's EAW should acknowledge the uncertainty of its modeling with an uncertainty range. The EAW should also include a sensitivity analysis to model scenarios involving variables such as alternative feeds and high or low productivity cases.

Another problem with the EAW is that it relies only on a 100-year global warming potential (GWP100) value. Even though under GWP100, methane is converted to CO_2e emissions using a factor of 28 (meaning 1 ton of methane is treated as having the same warming impact as 28 tons of CO_2 over a 100-year period), this approach can still obscure the near-term climate impacts of the Expansion Project's emissions. Given that methane is a short-lived but highly potent GHG, the analysis should also present emissions using a 20-year global warming potential (GWP20), which better reflects the Expansion Project's 30-year operational lifetime and the acute warming effects of methane during that period. Presenting both GWP100 and GWP20 values would provide a more complete and policy-relevant understanding of the Expansion Project's climate impact.

More critically, the Expansion Project's EAW also misses much of the Expansion Project's scope 3 emissions. A company's GHG emissions can be classified into three scopes:

> Scope 1 emissions are direct emissions from owned or controlled sources. Scope 2 emissions are indirect emissions from the generation of purchased energy. Scope 3 emissions are all indirect emissions (not included in scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions.[27]

While the EAW includes a table of the Expansion Project's scope 1 and scope 2 emissions, it fails to clearly quantify scope 3 emission.[28] The EAW narratively acknowledges several upstream and downstream emissions that typically fall under scope 3, but it does not fully quantify them in its final total. These full value chain or lifecycle emissions include, for example, emissions from feed production (including fertilizer manufacture and soil emissions), transportation of inputs and products, and downstream processing and distribution. As one example of a failure to count scope 3 emissions, while the EAW narratively identifies that there will be vehicle emissions from contractor and employee

[28] *Riverview's EAW for West River Dairy, supra* note 17, at 62–63.

commuting, milk hauling, and feed delivery and discusses strategies to mitigate these,[29] it does not include calculated estimates for these specific transport activities in its 72,210 tons/year total.

At the same time, the EAW selectively quantifies certain upstream and downstream impacts when doing so results in claimed emissions reductions, but miscategorizes them as scope 1 rather than scope 3. Inexplicably, the EAW does not quantify the total annual GHG emissions generated from feed production, but does quantify a specific reduction (or carbon sink credit) related to growing feed.[30] In another example, the upstream reduction from avoided synthetic fertilizer manufacturing (-9,038 tons) and the carbon sink credit for converting land to alfalfa feed (-2,662 tons) are both included in the total as scope 1 adjustments.[31] Such misleading and erroneous calculation methods result in significant asymmetry. Upstream and downstream emissions are included when they decrease the Expansion Project's reported footprint but excluded when they would increase it. Such one-sided accounting does not provide a complete or balanced picture of the Expansion Project's climate impacts and results in a significant understatement of total emissions.

And the Expansion Project's scope 3 emissions are likely large and material.[32] Figure 1 below provides estimated percentages of the U.S. dairy industry's lifecycle GHG emissions for fluid milk in 2008.[33] As the figure shows, emissions from enteric fermentation and manure management—which are scope 1 emissions for a dairy farm like West River Dairy—only comprise 51% of life cycle emissions. The other 49% of emissions—which are all scope 3 emissions—are from feed production, refrigeration and packaging, and distribution to retail and consumers. Newer research suggests that feed production in particular may contribute more than the 20% estimate from the 2008 data: in 2017, the U.N. Food and Agricultural Organization estimated that feed production and processing alone account for 45% of GHG emissions from livestock production.[34] As another example, U.S. dairy farm giant Rockview self-reported that its 2024 scope 3 emissions amounted to 537,144 metric tons CO_2e, over 67% of its total GHG footprint.[35] But almost all scope 3 emissions are left out of the Expansion Project's EAW. By omitting these scope 3 sources of emissions, the EAW likely ignores at least half of the Expansion Project's true GHG emissions.

Feed Production	20%
Refrigeration and Packaging	9%
Distribution, Retail and Consumer	20%

Figure 1. Allocation of fluid milk GHG emissions from the U.S. dairy industry in 2008.

For these reasons, the EAW's failure to quantify emissions from feed production is problematic and likely contributing to a significant understatement of emissions. The EAW does not list the total acres of crops required to feed the Expansion Project's cattle each year, only referring to the 2,200 acres of alfalfa proposed as a mitigation.[36] But 2,200 acres is generally not sufficient to feed 11,000 dairy cows as their primary forage source for a full year. For intensive dairy operations, a common guideline is 1.5 to 2.0 acres per cow to provide enough forage.[37] According to this guideline, 11,000 cows would require between 16,500 acres and 22,000 acres. Peer-reviewed data from high-producing Minnesota freestall dairy herds indicate dry matter intake of approximately 24.3 kg/cow/day, with forage comprising about 52% of the ration.[38] For 11,000 cows, that translates to approximately 97,565 metric tons of feed dry matter per year. Applying peer-reviewed carbon-footprint factors for common U.S. dairy feeds indicates that feed production alone would likely generate approximately 27,000 to 53,000 metric tons CO_2e per year.[39] This is not a minor or speculative source of emissions. It is a major lifecycle emissions category that the EAW fails to quantify.

Because these scope 3 emissions are both foreseeable and substantial, their exclusion and incomplete reporting thwarts MPCA's ability to evaluate the Expansion Project's true climate impact and its consistency with State climate goals. An EIS is required by law and is necessary to assess these lifecycle emissions and their cumulative effects, as discussed further in infra Part II.C.

Once the Expansion Project's GHGs are emitted their impacts are effectively irreversible. The Intergovernmental Panel on Climate Change (IPCC) has explained that the "very long lifetime of CO_2 in the atmosphere" means that "part of the CO_2 emitted by humans remains . . . for centuries to millennia."[40] As a result, GHGs accumulate and the warming they produce continues long after the underlying GHGs are emitted. This persistence means that the warming effects caused by GHG emissions are not only long-term but nearly impossible to fix within a meaningful duration, even if significant mitigation efforts occur.[41] Rapidly reducing short-lived GHGs like methane could provide an emergency brake on the rate of warming, slowing near-term temperature increases and reducing peak warming, but it cannot immediately undo the underlying climate harms that have already been set in motion.[42]

Indeed, committed warming due to ocean uptake and delayed equilibrium responses means that the environmental harms associated with climate change will persist independently of future mitigation efforts. Furthermore, even where recovery is theoretically possible, the long recovery lags oftenexhibited by ecological systems may extend recovery timelines for affected species and habitats by decades.[43]

In sum, GHG emissions from the Expansion Project pose threats of a type and extent that are significant and harmful to Minnesota's environment. The Expansion Project significantly increases, without effective mitigation or offsets, the emission of GHG pollutants contrary to state policy mandating reductions in all sectors. Moreover, the harms associated with the Expansion Project's GHG emissions are long-term, cumulative, and effectively irreversible. Accordingly, the type, extent and irreversibility of these potential effects weigh in favor of determining that the Expansion Project has the potential for significant environmental effects.

B. The EAW's Mitigation Plans Weigh In Favor Of An EIS

In addition to underestimating the GHG emissions of the West River Dairy Expansion, the EAW fails to fully grapple with mitigation methods. To fulfill the purpose of environmental review, the EAW must include a robust discussion of potential mitigation measures sufficient for meaningful public review.[44] As recognized by the Minnesota Supreme Court, mitigation analysis in an EAW "gives the public the assurance that the agency has indeed considered environmental concerns in its decisionmaking process . . . and, perhaps more significantly, provides a springboard for public comment."[45]

Rules and guidance make clear that the mitigation analysis must include not only a detailed description of planned mitigations and their efficacy, but also additional mitigation efforts that could be implemented to further reduce environmental effects.[46] Indeed, for purposes of avoiding an EIS, measures identified to mitigate potential adverse environmental effects must be "specific, targeted, and . . . certain."[47] The mitigation plans included in the EAW are not robust and do not fulfill these requirements.

While some categories of mitigation Riverview identifies may have value in the abstract—for example, certain feed formulations (such as those with lower crude protein and higher digestibility) can reduce enteric methane emissions from ruminants,[48] as can some feed additives,[49] and feed sources developed through lower carbon intensity practices can reduce total feedlot-associated GHGs[50] —they are largely

untested and their mitigation potential is limited. In trying to apply such mitigation practices here, the EAW lacks evidentiary support and enforceable implementation commitments needed to show that they will meaningfully reduce the Expansion Project's actual emissions.

The mitigations proposed in the EAW are indefinite and incomplete and cannot be reasonably expected to effectively mitigate the identified environmental impacts of the Expansion Project. To start, Riverview concedes that "it is difficult to accurately quantify the GHG reductions" of almost all the listed mitigation methods.[51] Despite the many mitigation activities touted in the EAW, Riverview itself acknowledges that "only two have clearly quantified reductions: (1) Alfalfa Conversion Carbon Sink, and (2) Area Ammonia Replacement."[52] The EAW also omits many alternative emission mitigation methods that could be reasonably expected to effectively mitigate the identified environmental impacts of the Expansion Project. Riverview does no alternative scenario modeling.

1. Mitigations identified in the EAW are unreliable and overstated

Several of Riverview's proposed mitigation approaches are flawed and unreliable, including its reliance on emissions reductions from alfalfa conversion and ammonia replacement.

As a threshold matter, the theoretical reductions in emissions from row crop conversion cannot count as "mitigations" for purposes of the MPCA determination because emissions from crop production (scope 3) were not included in the calculation of the Expansion Project's emission total. Riverview cannot claim a benefit from the possible GHG emissions avoided by row crop to alfalfa conversion when the EAW fails to identify crop production emissions as operational emissions.

a. Conversion of row crops to alfalfa

The EAW claims that converting row crops to alfalfa is an emissions-negative way to meet required feed production for the Expansion Project and that "1.21 tons CO_2e are avoided annually for each acre of row crop converted to alfalfa. The Project's cattle will require approximately 2,200 acres of alfalfa produced for feed each year," thus resulting in "a reduction in GHG emissions by 2,662 tons CO_2e per year."[53] But that assumed rate equates to approximately 2.99 tons CO_2e per hectare per year, or roughly 0.81 tons C per hectare per year—a relatively high soil-carbon sequestration assumption compared to published syntheses. For example, a global synthesis of soil organic carbon under perennial crops found that conversion from annual to perennial crops produced an average gain of 6.0 ± 4.6 Mg C/ha over 20 years in the 0–30 cm soil layer—approximately 0.30 Mg C/ha/year—with substantial variability and uncertainty across sites.[54] Similarly, a synthesis of 103 publications and 160 sites found that farmland-to-grassland conversion increased soil carbon stocks by approximately 0.30 Mg/ha/year.[55] More regionally relevant literature also counsels caution. A review of long-term Iowa studies found that conversion of cropland to perennial grassland increased soil organic carbon by 0.21–0.74 Mg C/ha/year, but emphasized that soil carbon responses were highly variable, slow to detect, and not always statistically significant.[56] And a 30-year study in southern Wisconsin found that alfalfa-based dairy forage systems actually lost an average of 0.54 ± 0.13 Mg C/ha/year—meaning alfalfa-based systems represent

[56] Jim Jordahl et al., *Carbon Storage in Cropland Soils: Insights from Iowa, United States*, 12 LAND 1630 (2023), https://doi.org/10.3390/land12081630 [Exhibit 30].

a carbon source, not a carbon sink.[57] Applied to Riverview's claimed 2,200 acres of alfalfa, the Wisconsin study's rate would imply approximately +1,763 metric tons CO_2/year rather than an emissions reduction. These studies show that the EAW cannot simply treat the alfalfa acreage as a fixed, annual emissions-negative credit without further support.

Even assuming that all feed production needs will be met by the 2,200 acres of alfalfa—which is not realistic as discussed above[58] —using land to grow alfalfa still results in emissions, even if those emissions are lower than they would be if the land was used to grow row crops. Rather than a mitigation that reduces the Expansion Project's emissions, the alfalfa conversion merely generates fewer emissions for the Expansion Project than row crops would. To illustrate this with a hypothetical, if row crops for required feed production generate 50,000 tons of emissions per year, and the alfalfa conversion reduces those emissions by 2,662 tons CO_2e per year, then the total feed-production-related emissions would be 47,378 tons CO_2e per year (50,000 minus 2,622). This number is greater than zero, and certainly not a mitigation, as the EAW claims.

The EAW's claim of net negative emission from feed production seems to stem from the following erroneous assumption:

> The nearby cropland that will be used for feed production for the Project is already in crop production. Since the Project will not trigger new crop production and will create a market for crops already being grown, a reduction in GHG emissions is anticipated due to the shorter transportation distance of those crops to the Project.[59]

This assumption ignores the reality that, by removing the supply of row crops already in production to feed the Expansion Project's cattle, market forces will replace the displaced row crops production in another location. This indirect land-use change may result in even greater emissions than the emissions reduction from the alfalfa conversion. And if required feed production for the Expansion Project's cattle is not entirely met by the 2,200 acres of alfalfa (as seems likely), then the EAW is also ignoring the emissions generated by other feed production required to meet the need of the Expansion Project's cattle. The EAW itself seems to assume that some amount of other row crops will be required for feed production, as evidenced by the statement discussed earlier that the Expansion Project will use nearby cropland.

Additionally, the EAW's alfalfa credit is unsupported because it assumes that 2,200 acres of alfalfa represent a durable conversion from row crops to an emissions-negative feed source. In the Upper Midwest, however, alfalfa is commonly grown as part of a crop rotation, not as a permanent replacement for annual row-crop production. A regional study of alfalfa stand length and subsequent crop patterns in Minnesota, Iowa, Wisconsin, Nebraska, North Dakota, and South Dakota found that corn was the most common crop planted in both the first and second years after alfalfa—79% and 61% of cases, respectively—and soybean was also commonly planted after alfalfa.[60] Thus, it is unclear whether the Expansion Project would actually convert permanent row-crop acreage to long-term alfalfa production, or merely introduce alfalfa temporarily within existing row-crop rotations. This distinction matters because any claimed soil-carbon benefit from alfalfa depends on duration, permanence,

management, and what happens after the alfalfa stand is terminated. If the acreage returns to corn or soybean production after a short rotation, any carbon benefit may be temporary, reduced, or reversed.

The EAW's claimed alfalfa credit is also unreliable because it is impossible to determine whether Riverview accounted for the nitrous oxide emissions associated with alfalfa production. The EAW treats conversion of row crops to alfalfa as a fixed emissions reduction, claiming that 1.21 tons CO_2e are avoided annually per acre and that 2,200 acres of alfalfa would therefore reduce emissions by 2,662 tons CO_2e per year.[61] But as a nitrogen-fixing crop, alfalfa can increase soil nitrogen availability and contribute to nitrous oxide emissions—a particularly powerful GHG—through nitrification and denitrification, particularly following rainfall, irrigation, and other soil-wetting events. A recent study found that continuous alfalfa growth was a substantial N_2O source, that short-term "hot moments" accounted for up to 57% of annual N_2O emissions, and that N_2O emissions reduced the system's carbon-sink potential by up to 14% annually.[62] When harvested biomass removal was considered, N_2O emissions offset 70% of the remaining ecosystem carbon sink.[63] The EAW does not disclose whether its alfalfa credit is net of N_2O emissions, whether it assumes any site-specific soil carbon sequestration, or whether it accounts for carbon removed from fields through repeated alfalfa harvests and later converted to CO_2 and methane when used as cattle feed. This omission is material. The Expansion Project cannot claim alfalfa as an emissions-negative feed source while failing to evaluate the GHG emissions generated by producing, harvesting, and fertilizing that alfalfa.

b. Ammonia-replacement credit

The EAW also claims that replacing ammonia fertilizer used on farms in surrounding areas with manure generated by the Expansion Project will mitigate the Expansion Project's emissions,[64] because ammonia from other sources would likely be produced through the energy-intensive Haber-Bosch process.[65] However, the EAW's modeling of emissions from the electricity required by the Haber-Bosch process relies on an emissions factor for the Midwest Reliability Organization West ("MROW") region.[66] While the MROW region includes Minnesota, it also includes parts of eight other states with various fuel mixes to generate electricity.[67] A more accurate model would use the emissions factor for Minnesota's electricity generation, which has a resource mix for electricity generation that is cleaner than the MROW region,[68] resulting in a lower emissions factor. Employing a lower, Minnesota-specific emissions factor in the EAW would result in a smaller emissions reduction from area ammonia replacement than Riverview claims.

Additionally, the EAW's ammonia-replacement credit assumes, without support, a particular fertilizer-sourcing baseline. The EAW claims that manure generated by the Expansion Project will replace approximately 1,545 tons per year of anhydrous ammonia and therefore reduce emissions by 9,038 tons CO_2 per year.[69] But the EAW does not establish what synthetic fertilizer products are currently used on the receiving fields, where those fertilizers are produced, whether the displaced product would in fact be anhydrous ammonia, or whether manure application would displace synthetic fertilizer on a one-for-

[68] Compare id. with MPCA GHG EMISSIONS IN MINNESOTA, supra note 4, at 13 (describing Minnesota's electricity generation resource mix).
[69] Riverview's EAW for West River Dairy, supra note 17, at 65.

one basis. These omissions matter because, while Minnesota is a major ammonia-consuming state, it appears to have no in-state ammonia production facilities: nearly all ammonia fertilizer used in Minnesota is produced outside the State and transported long distances, often from the Gulf Coast.[70] Thus, the EAW's claimed ammonia-replacement credit rests on an unsupported assumption about the source and emissions intensity of the fertilizer being displaced. At minimum, the EAW should identify the baseline fertilizer products used on the relevant fields, the likely production region and fuel mix for those products, and the amount of synthetic fertilizer that would actually be displaced before treating ammonia replacement as a fixed emissions reduction.

The EAW's modeling also assumes that the emissions factor for electricity generation will remain constant throughout the Expansion Project's lifespan. A more accurate model would take into account likely future emissions intensity reductions for the Haber-Bosch process to produce ammonia. Along with many states within the MROW region, Minnesota has reduced emissions from electricity generation over recent decades and has adopted climate goals to further reduce those emissions. For example, Minnesota reduced its GHG emissions from electricity generation by 50% from 2005 to 2022, and the "Minnesota Legislature adopted a new Clean Electricity Standard that requires electric utilities to provide net-zero, or 100% carbon-free, electricity by 2040."[71] More accurate modeling would reduce the scale of the mitigation from the Expansion Project's area ammonia replacement.

c. Other proposed mitigation methods

Other mitigation methods proposed in the EAW lack quantified emissions reductions, are theoretically flawed, and/or lack adequate supporting evidence. For instance, the EAW claims that the Expansion Project's use of Holstein-Jersey crossbred dairy cows will reduce GHG emissions per unit of milk produced, as compared to traditional Holstein cows.[72] Yet this claim is only supported with research on the emissions of Jersey cows compared to Holstein cows.[73] The EAW fails to provide any research on potential emissions reductions from the crossbred Holstein-Jersey cows that will be used in the Expansion Project.

The EAW also claims that the Expansion Project will employ efficient feed practices, "including research and use of feed additives such as Rumensin, to reduce GHG emissions by up to 4,365 tons CO_2e per year."[74] Yet the EAW provides zero citations or research on potential emissions reductions from efficient feed practices or feed additives, making it unclear why the EAW mentions Rumensin specifically and how Riverview calculated the alleged reduction of 4,365 tons CO_2e. Finally, the EAW claims that "[i]f market conditions allow, and renewable electricity is purchased from the utility provider for the Project, there would be a potential GHG offset of 5,520 tons CO_2e per year."[75] First, this mitigation is tentative

[70] Quailan Homann et al., Roadmap for Distributed Green Ammonia in Minnesota, RMI (June 2024), https://rmi.org/wp-content/uploads/dlm_uploads/2024/06/roadmap_for_distributed_green_ammonia_in_minnesota.pdf [Exhibit 35] (reporting that Minnesota is the fourth-highest ammonia-fertilizer-consuming state, accounting for more than 10% of market demand, but has no ammonia production facilities); Noah Fish, Local Ammonia Project Could Stabilize Fertilizer Supply For Southern Minnesota Farmers, A G WEEK (Mar. 17, 2026), https://www.agweek.com/local-ammonia-project-could-stabilize-fertilizer-supply-for-southern-minnesota-farmers [Exhibit 36]. Fertilizer sales data from the Minnesota Department of Agriculture is not helpful on this point, as it tracks fertilizer sales and distribution in Minnesota, rather than the state or region of production. [74] *Id*. at 66.
[75] *Id*.

and expressly conditioned on market conditions. Second, it lacks any citations to support the calculation of a 5,520 CO_2e offset.

The EAW also contends that "[m]eeting growing global dairy demand from less-efficient dairy production outside of North America would have a more detrimental impact on global climate change" than by meeting that demand with more-efficient dairy production inside of North America.[76] Even assuming that (1) global dairy demand will increase, (2) unmet demand would be satisfied through imports, and (3) North American dairy production is more emissions-efficient on a per-unit basis, this argument is beside the point and does not bear on the inquiry before MPCA. The question under environmental review is not whether the Expansion Project might be more efficient than hypothetical production elsewhere, but rather whether the Expansion Project's actual, incremental emissions have the potential to cause significant environmental effects in Minnesota.[77]

Moreover, the argument improperly substitutes emissions intensity (emissions per unit of production) for absolute emissions.[78] While it is often asserted that U.S. or North American dairy systems are more efficient on a per-unit basis, improvements in efficiency do not necessarily reduce total emissions.[79] In fact, increased productivity has historically coincided with increases in total sector emissions as production expands.[80] This reflects a well-established phenomenon: efficiency gains can lower emissions per unit while still increasing total emissions when overall output grows.

Most importantly, this line of reasoning is legally and analytically irrelevant to MPCA's obligations. The argument assumes that denying or conditioning this Expansion Project would result in increased production elsewhere, rather than reduced demand, substitution, or shifts in consumption. Such leakage-style arguments rest on speculative and unsupported assumptions about global market responses. The EAW provides no basis for making these assumptions.

The Minnesota Supreme Court held in *Citizens Advocating Responsible Development v. Kandiyohi County Board of Commissioners* that an RGU may not rely on vague or unsupported mitigation concepts.[81] Riverview is making a generalized claim that the Expansion Project is preferable to an imagined alternative production scenario somewhere else in the global dairy market. This argument does not reduce the Expansion Project's actual emissions. It does not impose any enforceable operational requirement. It does not identify a specific avoided source. And it does not provide substantial evidence that any claimed global emissions reduction will occur. At most, it is a policy argument about the relative efficiency of North American dairy production. It cannot be treated as mitigation, cannot offset the Expansion Project's quantified GHG emissions, and cannot support a negative EIS determination. Accepting such reasoning would effectively allow any high-emitting project to evade scrutiny by asserting that emissions might be higher elsewhere, undermining the purpose of environmental review entirely.

2. The EAW fails to discuss several mitigation measures that could actually reduce the Expansion Project's emissions

[76] *Riverview's EAW for West River Dairy, supra* note 17, at 65.

The EAW does not consider scenarios that improve manure management, build out renewable energy, or improve livestock conditions. Approaches such as these have been shown to reduce GHG emissions from animal agriculture.[82] Despite the Expansion Project's significant and continuous energy demands and emissions, the EAW does not quantify potential emissions reductions from these readily available and increasingly cost-effective strategies, nor does it evaluate their feasibility or effectiveness. Without that information, MPCA and the public cannot determine whether feasible mitigation measures could materially reduce the Expansion Project's emissions; whether the EAW's proposed mitigation is adequate, durable, or enforceable; or whether the Expansion Project's GHG impacts can be reduced below the level of significance.

a. Manure management

The Expansion Project will use clay-lined basins with impermeable covers to collect and store manure and wastewater, with liquid manure subsequently land applied as fertilizer on cropland.[83] As such, the Expansion Project's manure management system will be a major and persistent source of methane and nitrous oxide emissions. The EAW entirely fails to discuss alternatives, such as dry or composting systems, that can significantly reduce methane emissions.

Manure management makes up a significant portion of dairy cow emissions.[84] As dairy operations have gotten bigger, they increasingly produce and collect large volumes of liquid (rather than solid) manure.[85] This Expansion Project's manure management strategy is no exception. Storing liquid manure in anaerobic environments—such as ponds, lagoons, and the clay-lined basins proposed here—promotes bacterial activity that leads to methane production.[86] Per the EPA: "[M]anure management systems with the most substantial methane emissions are those associated with confined animal management operations where manure is handled in liquid-based systems."[87] Stored manure also produces nitrous oxide and carbon dioxide.[88] Thus, the Expansion Project's proposed manure management system reflects precisely the type of system that is widely recognized as a major and persistent source of GHG emissions.

When manure is applied to fields, exposure to oxygen and microbes in the soil can convert nitrogen from the manure into nitrous oxide, and the manure also produces carbon dioxide as it breaks down.[89] Cattle raised in the United States often live on farms that produce more manure than the surrounding land can absorb,[90] leading to nutrient runoff that creates GHGs and other pollution.[91]

That these clay-lined basins will be fitted with impermeable covers provides little relief.[92] While the use of impermeable covers may reduce certain emissions pathways—such as limiting ammonia volatilization and reducing rainfall infiltration that can increase storage volume—it does not eliminate methane generation from the stored manure. Methane production continues beneath the covers, and covered systems remain a significant source of GHG emissions.[93] Moreover, the scale of the proposed operation—generating over 200 million gallons of manure and wastewater annually—means that even marginal per-unit emission rates will translate into substantial absolute emissions increases over time.[94]

The Expansion Project's reliance on land application of manure compounds these impacts. Although manure can displace some synthetic fertilizer use, its application—particularly at the volumes contemplated here—increases the risk of nitrous oxide emissions from soils, especially under conditions of excess nitrogen, variable weather, and saturated soils.[95] In addition, nutrient runoff associated with over-application or extreme precipitation events contributes to downstream water quality degradation, which in turn can drive secondary GHG emissions, including nitrous oxide from aquatic systems.

The EAW fails to adequately evaluate whether the surrounding cropland can consistently and safely absorb the Expansion Project's manure supply. The EAW states that the Expansion Project will require approximately 7,700 acres for manure application and that the combined Expansion Project and existing facility will require approximately 13,200 acres, with 16,669 acres identified as available.[96] But those acres are not simply co-located immediately around the facility: the EAW identifies manure application sites across five townships in Stevens County and two townships in Swift County.[97] At the same time, the EAW does not provide a field-by-field nutrient balance, distance-weighted transport analysis, or average and maximum manure movement distances. Nor does it quantify the emissions associated with pumping, transferring, hauling, or otherwise moving manure to those fields. As such, the EAW does not demonstrate that the Expansion Project's manure can be applied at agronomic rates each year without

increasing nitrous oxide or transport-related emissions,[98] and (as discussed more in infra Part IV) runoff risk and other pollution.

Transitioning from long-term liquid storage systems to dry or composting systems paired with non-digester covered storage can significantly reduce methane emissions.[99] Whereas liquid manure systems maintain oxygen-deprived environments that are ideal for methanogenic bacteria,[100]dry handling and composting systems promote aerobic conditions, in which oxygen is present and microbial communities instead produce carbon dioxide (a substantially less potent GHG) rather than methane.[101]

Solid manure management systems, including scrape-and-stack methods, frequent removal from housing areas, and composting, reduce the residence time of manure in anaerobic conditions and limit the accumulation of large volumes of wet waste.[102] Composting, in particular, can be managed to maintain optimal temperature, moisture, and aeration levels, further suppressing methane formation

while stabilizing nutrients.[103] When properly implemented, these systems can result in orders-of-magnitude reductions in methane emissions compared to conventional liquid storage.[104]

Additionally, where some degree of storage remains necessary, transitioning to covered storage that minimizes moisture inputs (e.g., by excluding precipitation) without creating sealed anaerobic conditions can further reduce emissions. Unlike impermeable lagoon covers that trap and concentrate methane beneath them, requiring a vent or adsorbents to avoid explosion, non-digester covered or dry-stack storage systems aim to prevent excess water infiltration while maintaining conditions that discourage methanogenesis.[105]

Importantly, these alternative systems can also provide co-benefits, including reduced risk of catastrophic spills, improved nutrient management, and lower potential for downstream water contamination.[106] While they may require different infrastructure and management practices, they represent a well-established pathway for materially reducing the climate impact of manure management—particularly for large-scale operations where liquid systems would otherwise generate substantial and continuous methane emissions.

b. Renewable energy buildout

Renewable energy buildout is another concrete mitigation pathway the EAW should have evaluated, rather than treating renewable electricity as a contingent, market-dependent offset. The Expansion Project will create substantial ongoing electricity and fuel demand for cross-ventilated barns, milking and milk-cooling operations, ventilation systems, pumps, lighting, manure handling, and related equipment; yet the EAW does not model whether those loads could be reduced through on-site solar arrays, dedicated wind procurement or development, electrification of diesel-powered machinery and other farm equipment, or battery storage and demand-response measures to manage peak loads and maximize on-site renewable use.[107]

Peer-reviewed research supports the relevance of these measures: dairy-specific studies have found that photovoltaic ("PV") systems can feasibly supply dairy-farm electricity loads and reduce the GHG intensity of farm electricity by up to 29%, and a recent techno-economic assessment of dairy-farm solar PV with battery storage found substantial CO_2 reductions under farm-specific operating profiles.[108] Studies of large-scale dairy farms also show that milking and related operations contribute to electricity demand peaks, and that demand flexibility or storage technologies can reduce peak impacts.[109]

Likewise, agricultural machinery electrification is a feasible decarbonization pathway for replacing diesel equipment, and life-cycle assessment research has found battery-electric tractors to have substantially

lower GWP than conventional tractor systems when evaluated over the full use phase and life cycle.[110] Dedicated wind energy should also have been assessed as a low-carbon electricity source, subject to site-specific resource, interconnection, and land-use constraints.[111]

c. Livestock management

Improved livestock management can also significantly reduce the volume and intensity of GHG emissions from feedlots. Reducing use of nontherapeutic antibiotics can prevent increased methane emissions from animals' disrupted microbiomes.[112] Healthier animals are more productive and emit fewer GHGs per unit of output.[113] By contrast, animals in overcrowded conditions experience more stress, contributing to disease spread and inefficient feed conversion, all of which can increase methane and nitrous oxide emissions per animal.[114]

The cows living in the proposed feedlot will be housed in a cross-ventilated, total-confinement, free-stall barn.[115] In free-stall total confinement systems, cows are housed indoors year-round in controlled environments. Such systems are typically associated with higher reliance on energy inputs (e.g., ventilation, cooling) and, as discussed above, centralized manure collection systems that can increase methane emissions if manure is stored in liquid form.[116] Moreover, large-scale confinement can exacerbate the stress and disease pressures that reduce feed efficiency and increase emissions intensity.

By contrast, pasture-based systems allow cows to engage in a broader range of natural behaviors, including grazing, walking, and social interaction in more dynamic environments.[117] Access to pasture is generally associated with improved hoof health, lower rates of lameness, and increased behavioral expression.[118] Pasture systems can also reduce stress by allowing animals to self-regulate movement,

rest, and feeding patterns.[119] From a welfare perspective, the ability to graze is often considered a core behavioral need for ruminants, and its absence in confinement systems is a key point of concern.[120]

Indeed, the most impactful strategy to reduce GHG emissions from feedlots is to directly address the scale and intensity of animal production.[121] Such approaches would align with Minnesota's longstanding commitment to maintaining small, family-owned farms:

> The legislature finds that it is in the interests of the state to encourage and protect the family farm as a basic economic unit, to insure it as the most socially desirable mode of agricultural production, and to enhance and promote the stability and well-being of rural society in Minnesota and the nuclear family.[122]

Yet, despite this statutory commitment, the number of permits for new farms is going down while the number of animals per farm goes up.[123] Dairy feedlots in the United States have become increasingly consolidated, with a small number of large operations handling most cattle.[124] The trend in Minnesota mirrors this national shift and would be exacerbated by the proposed dairy expansion.[125]

This concentration significantly magnifies GHG emissions and cumulative environmental impacts per site.[126] From a climate perspective, concentration creates GHG "hotspots" with emissions comparable to industrial sources.[127] Moreover, as discussed above, the volume of manure generated at these facilities often exceeds the nutrient absorption capacity of surrounding land, leading to runoff and leaching that pollutes water sources and contributes further to nitrous oxide emissions.[128]

High-density operations are also more vulnerable to climate-related events, such as heavy rainfall and lagoon overflows, increasing the likelihood of catastrophic pollution events.[129] As MPCA's feedlot program manager recently commented: "Minnesota has also been getting more extreme and unpredictable rain storms than it did when its [feedlot] rules were last updated [in 2000], which have caused manure lagoons to overflow and increased runoff on farms."[130] If GHG emissions reductions are not required from larger and denser feedlots, Minnesota risks entrenching a model of production that not only worsens climate impacts but also undermines broader environmental, public health, and equity goals.

The EAW fails to evaluate alternative livestock management approaches. This omission is significant because different production systems—such as pasture-based or hybrid models, reduced stocking densities, distributed smaller-scale operations, or alternative manure handling systems—can materially alter both the magnitude and intensity of GHG emissions, as well as associated environmental and public health impacts. An adequate environmental review would assess whether feasible alternatives could achieve similar production objectives with lower emissions and reduced risk. Without such an analysis, the record does not allow MPCA to meaningfully compare the proposed high-density, confinement-based model against less emissions-intensive approaches or to determine whether the Expansion Project represents the least environmentally harmful practicable alternative.

In sum, the EAW fails to identify any ways in which the Expansion Project would be subject to mitigation by ongoing public regulatory authority or any other mitigation measures that could reasonably be expected to effectively mitigate the significant increase in GHG emissions from the Expansion Project. This factor weighs in favor of requiring an EIS.

C. The Expansion Project's Cumulative Potential Effects Weigh Heavily In Favor Of An EIS

The Expansion Project's GHG emissions must be considered in the context of its cumulative potential effects. Minnesota's environmental-review rules define "cumulative potential effects" as incremental effects "in addition to other projects in the environmentally relevant area" that may affect the same environmental resources.[131] The rule also recognizes that significant cumulative potential effects can result from individually minor projects over time, and that the RGU must consider historic and forecasted trends when determining whether future projects are reasonably likely to occur.[132]

For GHG emissions, the environmentally relevant area cannot be limited to the facility footprint, manure-spreading fields, or a one-mile well radius. The relevant environmental resource is the atmosphere and climate system, and the relevant cumulative context is the aggregate contribution of existing and reasonably foreseeable emission sources that affect that same resource. The Minnesota Court of Appeals has recognized GHG emissions as a cumulative potential effects issue in environmental review. In Mankato Motorsports Park, the court reversed a negative EIS declaration where the RGU had failed to adequately consider cumulative GHG impacts, explaining that the cumulative-effects criterion required the RGU to place the project in context rather than evaluating its incremental emissions in

isolation.[133] The court also held that omitting an important source of GHG emissions from the project's analysis rendered the GHG analysis arbitrary, capricious, and unsupported by substantial evidence.[134]

The West River Dairy EAW suffers from the same fundamental flaw. Although the EAW quantifies the Expansion Project's operational GHG emissions at 72,210 tons CO_2e/year, the actual cumulative potential effects analysis in Item 21 does not discuss climate impacts at all.[135] Instead, Item 21 defines the "Environmentally Relevant Area" as the Expansion Project site, the dedicated manure application acreage for the Expansion Project and existing facility, and a one-mile radius around the off-site well, then limits the cumulative discussion to overlapping manure application and groundwater extraction.[136] That is not a cumulative climate analysis. It does not evaluate whether the Expansion Project's substantial annual GHG emissions will combine with existing and reasonably foreseeable emissions from other animal agriculture operations to affect the same climate resource.

That omission is material, especially because the agricultural sector's emissions in Minnesota have remained persistently high, and because large feedlot operations are a significant and growing source. Each additional major source compounds the problem, making it more difficult to achieve State and regional climate goals. GHG emissions are cumulative and long-lived; once emitted, they contribute to warming for decades or hundreds of years. As a result, the Expansion Project's emissions will cause irreversible environmental harm that cannot be fully mitigated after the fact.

In Minnesota, dairy cattle were the largest source of enteric fermentation and second largest source of manure management emissions in 2023.[137] That year, the State's methane emissions from manure management and enteric fermentation together were more than 8.8 million metric tons of CO2 equivalent, more than all emissions from the commercial sector (about 7.3 million) and the waste sector (about 1.5 million) combined.[138] And methane emissions from animal agriculture are trending upward in Minnesota: "[S]ince 2005, methane emissions from animal agriculture have increased 10% in the state . . . ."[139] The trend in emissions from manure management is especially concerning, as those emissions have grown about 30% in Minnesota from 2005 to 2023.[140] To fully understand the scope of animal agriculture emissions relative to other sources, see Figure 2 below from Minnesota's 2026 Climate Action Framework, which shows that manure management and enteric fermentation combined emit more in Minnesota than heavy-duty trucks, passenger cars, aviation, or natural gas in the industrial, residential, or electricity generation sectors.

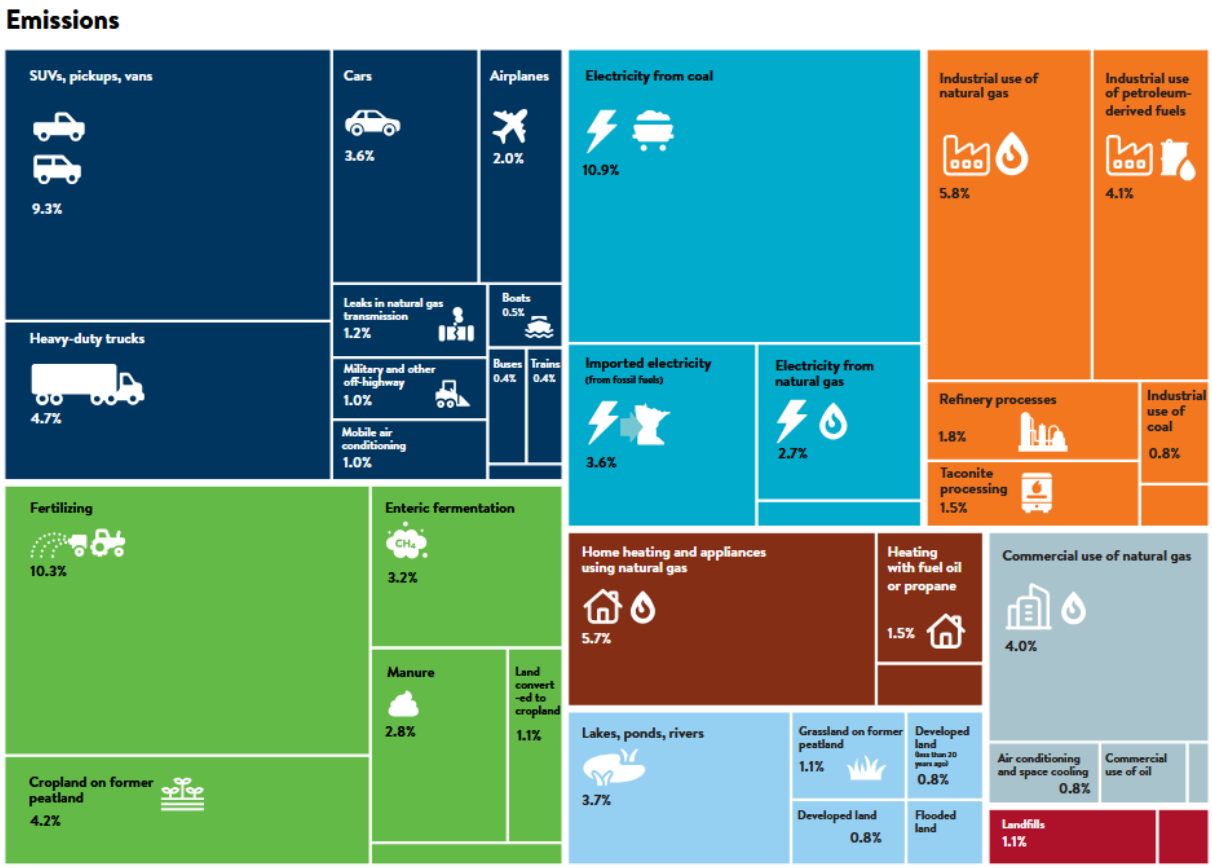

Figure 2: Minnesota's 2026 Climate Action Framework Emissions Breakdown.

By adding tens of thousands of tons of CO_2-equivalent emissions annually over the Expansion Project's lifetime, the Expansion Project will contribute meaningfully to climate change. GHG emissions accumulate in the atmosphere and drive increases in global temperatures. Methane and nitrous oxide—the primary emissions associated with this Expansion Project—are particularly potent climate pollutants, with significantly greater warming potential than carbon dioxide over relevant time horizons.

Methane is about 80 times more warming than carbon dioxide over a 20-year period.[141] But because of its relatively short persistence in the atmosphere—with an average methane molecule remaining for about ten years[142] (as compared to carbon dioxide, which can cause warming for thousands of years[143])—reducing methane emissions in the coming years can play an important role in curbing warming.[144]

ENV'T PROGRAMME, GLOBAL METHANE ASSESSMENT 8, 11 (2021), https://www.ccacoalition.org/sites/default/files/resources//2021_Global-Methane_Assessment_full_0.pdf ("Reducing human-caused methane emissions is one of the most cost-effective strategies to rapidly reduce the rate of warming and contribute significantly to global efforts to limit temperature rise to 1.5ºC.") [Exhibit 100, hereinafter "GLOBAL METHANE ASSESSMENT"]. As observed by one of the lead reviewers of a 2021 U.N. Intergovernmental Panel on Climate Change report: "Cutting methane is the biggest opportunity to slow warming between now and 2040. We need to face this emergency." Fiona Harvey, *Reduce Methane or Face Climate Catastrophe, Scientists Warn*, GUARDIAN (Aug. 6, 2021),

Moreover, reducing carbon dioxide emissions without serious action on super-pollutants, including methane, will preclude achievement of the Paris Climate Agreement and Minnesota's GHG reduction goals.[145]

Nitrous oxide, like methane, is a climate super-pollutant closely associated with animal farming.[146] Nitrous oxide is one of the most powerful GHGs—estimated to contribute 273 times more than carbon dioxide to global warming over a 100-year timescale[147] —and is also harmful to the ozone layer.[148] Human-caused emissions of nitrous oxide have increased more than 40% over the past forty years, driven in large part by the use of nitrogen fertilizer and manure from farmed animals.[149] According to a U.N. estimate, animal agriculture is responsible for at least half of global anthropogenic nitrous oxide emissions.[150] The agricultural sector is responsible for nearly all of Minnesota's nitrous oxide emissions, and a significant portion of those emissions are attributed to the land application of manure.[151] Since 2005, "nitrous oxide emissions related to both manure and synthetic fertilizer use have increased 9%" in Minnesota.[152]

Thus, the Expansion Project's GHG emissions will aggravate the consequences of climate change in Minnesota. The Expansion Project's emissions will contribute to increased frequency and severity of extreme weather events, including heavy rainfall, flooding, heat waves, and drought. These impacts are particularly relevant in Minnesota, where recent trends show increasing precipitation intensity and temperature.

Rising temperatures and the increase in size and frequency of storms and disasters has resulted in unprecedented damage.[153] Per MPCA: "Daily average minimum temperatures during winter (Dec-Feb) have increased 7.3 degrees from 1895-2021 in northern Minnesota, 6 degrees in central Minnesota and 4.9 degrees in southern Minnesota."[154] Lakes are now experiencing an average of up to two fewer weeks of ice cover each year.[155] These changes put an increasing strain on Minnesota's budget.[156] According to MPCA: "Over the past decade . . . our state has been experiencing a much higher rate of

natural disasters, with a higher number of individual storms that cause more than $1 billion in damage."[157]

Climate-driven increases in precipitation intensity and runoff will exacerbate nutrient pollution associated with manure management. As temperatures rise and rainfall events become more extreme, nitrogen and phosphorus losses from manure- applied fields are expected to increase, contributing to eutrophication of lakes, rivers, and downstream waters.[158] These impacts include harmful algal blooms, hypoxia, and degradation of drinking water sources.[159] Given the scale of manure generation associated with the Expansion Project, even small increases in runoff rates can translate into significant additional pollutant loading.

Agricultural producers are themselves intensely vulnerable to the impacts of climate change. In the summer of 2023, the administrator of the U.S. Department of Agriculture's (USDA's) Farm Service Agency observed:

> The recent heat domes plaguing many parts of the country have proven to be unsurvivable for some animals and temperatures are not expected to let up any time soon. This is one of the latest, many examples of how a changing climate is creating immediate challenges for farmers and ranchers. . . .[160]

According to MPCA, farmers are already experiencing (and can expect to continue experiencing) a range of negative impacts from climate change.[161] Rising temperatures, unpredictable precipitation, and more frequent extreme weather events are disrupting planting schedules, reducing crop yields, and increasing crop losses from pests, diseases, and disasters.[162] While some areas experience heavy rainfall and flooding, others suffer from prolonged dry spells and drought, often within the same growing season. This variability not only lowers crop yields but also degrades soil and water quality.[163] Here in Minnesota, climate change is driving more intense and erratic droughts in this water-rich state, and extreme droughts are stressing water supplies and state budgets. Just a few years ago in 2021, a historic drought across the State prompted $10 million in emergency funding to help producers withstand the dry conditions.[164] The lack of rain has also prompted producers to increase irrigation. In the summer of 2021, farmers collectively withdrew 6.1 billion gallons of water more than their permits allowed.[165]

Reports from Smithfield Grain, a major feed purchaser and subsidiary of Smithfield Foods—one of the world's largest pig producers—highlight how these climate stressors are already affecting Minnesota producers. In June 2025, spring crop planting and development in some parts of the Upper Midwest was delayed by extreme weather events including strong winds, dust storms, and erratic rainfall that disrupted planting and damaged crops.[166] The University of Minnesota Research and Outreach Center at Lamberton reported below-average rainfall and the lowest soil moisture levels in five years.[167] Abnormally dry to moderate drought conditions were documented across western and northern Minnesota.[168] These impacts not only threaten crop yields and farm incomes but can also increase feed costs and risk food system instability.

Climate change is also producing more severe storms that dump large amounts of water on the land in a short amount of time. These "mega-rain" events are not as helpful for growing crops as slow, soaking rains, and climate change is bringing more of these intense, unhelpful storms to Minnesota.[169] Minnesota farmers increasingly face the added burden of managing wet pastures and feed soaked by storms, and animals suffer and have even drowned in flash flood conditions.[170] The Minnesota State Cattlemen's Association president observed in 2024: "With this drastic change in cool to hot and the water stresses, we did have a feedlot call that had fairly higher death loss due to some of this water and stress that they're dealing with in cattle . . . ."[171]

Rising temperatures will further harm livestock health and productivity. For example, "[h]eat-stressed hogs eat less, and heat may interfere with breeding, gestation, and lactation."[172] Indeed, the EAW notes that "[h]igher temperatures and humidity increase the potential for animal heat stress and decreased milk production."[173] However, the EAW fails to fully assess the impact of temperature increases on its herd—and, as discussed above, to propose adequate mitigation strategies to reduce the Expansion Project's contributions to these dangers.

During a heat wave in 2011, an estimated 1,000 cattle died in south central and southwestern Minnesota due to extreme temperatures, causing estimated losses of roughly $1 million.[174] MPCA has itself said that, because "[d]airy cattle operations in Minnesota typically do not currently have the equipment necessary to mitigate the risks of high temperatures," milk production decreases on very hot days.[175] Thus, MPCA modeling of scenarios where GHG emissions continue unabated predict that production value "[l]osses increase later in the century due to more significant temperature increases,

with more instances of daily temperatures crossing heat stress thresholds."[176] Figure 3 below lists the projected mid-century cost of inaction in three emissions scenarios modeled by MPCA.

		Dairy Milk
		Lost production value
Mid-Century (2040–2059)	Intermediate	$1,000 (-$440 to $3,300)
	High	$1,900 ($780 to $3,300)
	Very High	$1,500 (-$1,100 to $3,700)

Annual costs (in millions, 2024$) for three time periods and three emissions scenarios (see Section 2.2.2 for more details). Costs are incremental to baseline and averaged across six climate models (range across climate models provided in parentheses). See Appendix B for more details on methodology and limitations.

Figure 3. Quantified Costs of Inaction (Millions per Year): Livestock.

Accordingly, climate change driven by GHG emissions poses significant risks to Minnesota's agricultural sector, including increased crop variability, reduced yields under heat stress, and greater input costs associated with water management and adaptation. Ironically, while the Expansion Project is intended to grow agricultural production, its emissions contribute to broader climate impacts that threaten the long-term viability of the sector. In addition, climate-related damages—such as flooding, infrastructure degradation, and water quality impairment—impose significant economic costs on the State and its residents.

The Expansion Project's EAW acknowledges that agriculture emissions have not declined statewide. Yet there is no analysis of cumulative regional dairy expansion, no carbon budget framing, and no comparison against Minnesota climate targets. Moreover, even though Riverview predicts that the Expansion Project's lifetime emissions will total 2.17 million tons CO 2 e, the EAW lacks a policy compatibility assessment. The EAW does not quantify economic climate damages, such as by providing a social cost of carbon, and does not compare the Expansion Project's emissions to state-sector reduction needs.

These challenges and deficiencies underscore the urgent need for MPCA to require an EIS that fully evaluates GHG emissions from the proposed feedlot. Addressing these emissions will not only protect against future climate damage but also help stabilize Minnesota's agricultural economy and food supply in the face of increasing environmental volatility.

* * *

The EAW, both on its face and in what it failed to disclose, demonstrates that the Expansion Project has the potential for significant environmental effects from its contribution to increasing levels of GHG emissions. Emissions from the Expansion Project are not effectively mitigated or offset; and they are contrary to Minnesota law and policy directing steep reductions in emissions. Because the Expansion Project has the potential for significant environmental effects, the MPCA must order an EIS.

III. THERE ARE POTENTIAL SIGNIFICANT ENVIRONMENTAL EFFECTS ASSOCIATED WITH RIVERVIEW'S PROPOSED GROUNDWATER ALLOCATION

The Expansion Project intends to quench its thirst with a truly extraordinary sequence of features. Riverview plans on pumping 226 million gallons of groundwater per year ("MGY") from a well located

[176] Id.

miles away from the Expansion Project.[177] The groundwater will be pulled from a surficial aquifer hydrologically connected to the Pomme de Terre River, where it will travel three-plus miles in a buried waterline that crosses multiple roads before reaching the Expansion Project. As part of the Expansion Project, Riverview intends to construct two massive water storage basins at the feedlot, each of which needs a dam safety permit from DNR, to store water on-site. Water for the feedlot will be pulled from the storage basins, which will be recharged from groundwater pumped from the surficial aquifer three-plus miles away.

Riverview is seeking to use a well and a water appropriation that DNR previously granted to a proposed ethanol plant nearly two decades ago. The ethanol plant was never built; the permit has expired; and no water was ever appropriated under the permit. Riverview has apparently secured DNR's agreement to provide an appropriation permit to Riverview based on the analysis conducted to support the ethanol plant permit (the "2007 Aquifer Report"). That analysis, from 2007, allegedly assessed the suitability of withdrawing groundwater from a surficial aquifer near the Pomme de Terre River. DNR has not conducted any independent or separate environmental review to justify a water appropriation permit for the proposed Expansion Project and is instead relying on this draft EAW. No analysis is provided in the EAW to justify the water appropriation other than the 2007 Aquifer Report.

The EAW claims that environmental impacts from this plan have been considered and mitigated. But this claim rests upon an outdated aquifer report that considers old information that tells an incomplete story about the environmental impacts of Riverview's water allocation plan. Because the potential for significant environmental effects from Riverview's water appropriation is high, MPCA must prepare an EIS.

A. The 2007 Aquifer Report MPCA Relies Upon In Analyzing Potential Groundwater Impacts Is Almost Two Decades Out-Of-Date

Riverview seeks permission to withdraw 226 MGY of water for the Expansion Project. Riverview's proposed water source is an off-site well approximately three miles southeast of the Expansion Project (Well Id No. 740629, "the Off-Site Well").[178] The Off- Site Well was first permitted for a 452 MGY appropriation in 2008 to serve a proposed ethanol plant (Permit #2008-0230).[179] In 2014, this permit was amended to allow 226 MGY to be used for livestock watering, with the other half still allocated for the ethanol plant. As part of this arrangement, Riverview was listed as an "authorized agent."[180] Water was never actually appropriated from this well under either the 2008 permit or the amended 2014 permit.[181] In May 2025, Riverview submitted an application for a new water appropriation permit to pump 226 MGY from the Off-Site Well.[182]

The EAW states that prior to obtaining the 2008 water appropriation permit, the ethanol plan conducted an aquifer test (the "2007 Aquifer Test")[183] The 2007 Aquifer Test reveals that the Off-Site Well is hydraulically connected to the Pomme de Terre River, and that "pumping from the aquifer would . . .

[182] *Riverview's EAW for West River Dairy, supra* note 17, at Attachment 11 (Riverview Letter). This letter was in response to an apparent dispute between DNR and Riverview about whether Riverview could use the existing permit for its proposed expansion project. The EAW indicates that the water appropriation permit amendment for the Off-Site Well is pending. *Id*. at 23 (permit number 2008-0230).
[183] *Riverview's EAW for West River Dairy, supra* note 17, at 35.

reduce the long-term average flow rate in the river by approximately the average pumping rate."[184] Using the 2007 Aquifer Report, DNR imposed pumping restrictions on the Off-Site Well that curtail appropriations based on the flow of the Pomme de Terre River.[185]

These pumping restrictions are to remain in place for Riverview, and the EAW leans on the 2007 Aquifer Report to explain away environmental concerns associated with the proposed water allocation. However, for multiple reasons the accuracy of the 2007 Report has faded with time, resulting in the potential for significant environmental effects not considered and resolved by the 2007 Aquifer Report.

1. The 2007 Aquifer Report is outdated

There are many reasons to doubt the continued utility of the 2007 Aquifer Report. First, the 2007 Aquifer Report uses pre-2007 data and conditions to reach conclusions about protecting the river and natural resources. For example, the report helps justify permit conditions curtailing withdrawals to protect the Pomme de Terre River when flow drops to 31 cubic feet per second ("CFS"), the rate determined in 2007 to be when adverse impacts occur. This adverse rate was established by looking at the annual flow rate that occurred for at least 90% of the time for the relevant reach of river in 2005. Flows have changed since then,[186] and given the direct connection between the Pomme de Terre River and the surficial aquifer, more recent data about protected flow rates should be considered.

Second, since 2007, new wells have been dug into the same surficial aquifer that Riverview seeks to access. Well data from the Minnesota Department of Health shows new wells drilled in 2023 and 2013 that are close in proximity to the Off-Site Well.[187] These are active irrigation wells that permitted to access the same water source years after the 2007 Aquifer Test was completed. Because the wells did not exist when the study was completed, the 2007 Aquifer Test's conclusion that the well pump rate will not cause interference drawdown in existing wells or impacts to nearby wetlands is no longer trustworthy.

Third, the quality of the data is low. The nearest flow monitoring device is over 30 river-miles downstream from the Off-Site Well, near the town of Appleton. This is where river flow data that informs the Off-Site Well's permit conditions is collected. In other words, the Expansion Project's water appropriation levels are limited based on river flow data collected far downstream. But this is not a good indication of river levels just downstream of the Off-Site Well, where the natural resource impacts from withdrawing water from the Off-Site Well will be felt because of the hydrologic connection between the Pomme de Terre River and the aquifer. Comparing Pomme de Terre River discharge rates from the flow monitor at Appleton and the nearest upstream monitor, located over 50 river miles north, shows that river flows vary significantly this section of the river.[188] For example, data collected on May 1, 2026 shows river discharge at the Appleton monitor to be 365 CFS, over twice as high as the upstream discharge rate of 165 CFS. This means that Pomme de Terre River flow at Appleton is not a suitable proxy for river conditions adjacent to the Off-Site Well.

---

Finally, new information and knowledge about groundwater sustainability and water quality in this region has been developed since 2007. The 2007 Aquifer Report explains that the ethanol plant was exploring accessing the surficial aquifer to mitigate water availability questions from an existing well drilled into a confined aquifer. Concerns about well interference, but not groundwater sustainability, motivated the search for a different source of water. Presently, however, DNR recognizes that there are "potential sustainability concerns" in the surficial aquifer, and that the buried aquifer system in this region of the state "is likely over-allocated,"[189] The 2007 Aquifer Report did not mention groundwater sustainability as a potential concern about the water appropriation. Less than two decades later, however, DNR acknowledges that groundwater levels are being impacted by water appropriations. DNR has explained that decreasing groundwater availability could be due to "intensified local groundwater consumption," and noted a downward trend in groundwater levels for 7.5% of wells between 2000 and 2019 in the area of Minnesota where the Expansion Project would be located.[190] Groundwater demand is "high in western Minnesota, where the groundwater supply is limited."[191] These recent findings undermine the credibility of the 2007 Aquifer Report, which did not cite groundwater sustainability as a risk from the appropriation.

Moreover, new reports assessing water quality trends across the Pomme de Terre River watershed highlight the threat land use change and altered hydrology have on the region's aquatic resources.[192] These studies did not exist when the 2007 Aquifer Report was prepared. Given that they are available now, decisions about water appropriation should be made with this more recent data in mind.

2. The 2007 Aquifer Report fails to identify the potential for significant environmental effects from water appropriation

There are also multiple reasons why the Expansion Project's proposed water allocation has the potential for significant environmental effects despite the 2007 Aquifer Report. First, the 2007 Aquifer Report does not address the potential water quality impacts from withdrawing 226 MGY from an aquifer hydrologically connected to the Pomme de Terre River. Groundwater pulled from the Off-Site Well corresponds to a reduction in Pomme de Terre River flow,[193] which can concentrate pollution in the river. Much of the groundwater pumped from the Off-Site Well will be mixed with manure, and later nearly all the liquid manure will be applied on cropland within the watershed. This is confirmed in the EAW, which reports that Riverview intends to land apply all the liquid manure produced by the additional 11,000 cows.[194] This land-applied liquid manure will have high nitrate concentrations and nitrate loads and eventually work its way back into the river, either as groundwater baseflow or via the artificial drainage network, which is a main driver of water quality impairments in the region.[195] Given the extent of the drainage infrastructure in Stevens County, the need to evaluate the potential water

[193] 2007 Aquifer Report, *supra* note 184, at 18 ("Because the river is the primary discharge area for the water-table aquifer, the long-term impact of public from the aquifer would be to reduce the long-term average flow rate in the river by approximately the average pumping rate.).
[194] *Compare Riverview's EAW for West River Dairy, supra* note 17, at 8 (showing 202,744,000 gallons of liquid manure each year if the Expansion Project is constructed) *with id* at 41-42 (explaining that the entirety of the 113,619,000 gallons of liquid manure produced by the additional cows for the Expansion Project will be land-applied in the watershed).
[195] Pomme de Terre WRAPS, *supra note* 186, at 32 – 34.

quality impacts is paramount.[196] This concern is not discussed in the 2007 Aquifer Report because it was well-beyond the scope of the report—the water intended for the ethanol plant was not going to be mixed with manure and applied on the nearby landscape. Indeed, discharges from an industrial facility like an ethanol plant are specifically regulated to ensure they will not pollute receiving waters; the discharge of Riverview's 226 GPY appropriation will not be regulated.

Second, the appropriation demand on the surficial aquifer has not been adequately reviewed. Since 2007, new irrigation wells have been drilled into the same surficial aquifer the Off-Site Well accesses. The EAW does not discuss these new wells, pointing instead to the 2007 Aquifer Report as proof that the requested appropriation is sustainable. But the 2007 report predated DNR's more recent assessment of water resources in the area that indicates the need to consider all nearby wells for risk of interference.[197] This work appears to remain outstanding.

Last, the EAW does not address the impact altered hydrology has on river flow and thus whether the flow-based permit conditions will protect natural resources. Although the Pomme de Terre's flow is increasing, the additional flow is being driven by artificial drainage, which supplies a significant volume of water from discrete conveyances.[198] The artificial drainage network interrupts natural river hydrology, and can impact the volume and duration of low, medium, and high flow events. This is because drainage systems quickly shunt water off the landscape, where the water traverses the drainage network before reaching a surface water. The volume of water funneled through the drainage network causes rivers to be more "flashy," meaning that average flow figures may not present a clear picture of river conditions.[199] This means that local impacts to wetlands and other aquatic resources cannot be accurately projected by flow conditions based on data collected far downstream. This data gap should be filled in by an EIS.

Although DNR has indicated that if certain conditions are met (such as pumping restrictions dependent on flow conditions in the Pomme de Terre River) an updated aquifer test will not be needed for the new permit,[200] MPCA nonetheless has an obligation to accurately evaluate potential water quality and other natural resource impacts from pumping groundwater at the Off-Site Well. An updated aquifer test is needed to properly evaluate potential negative impacts to groundwater quantity and quality resulting from the Expansion Project, and MPCA should analyze the results of that test within an EIS.

B. MPCA Must Analyze The Cumulative Impacts Of The Proposed Groundwater Withdrawals For Both The Expansion Project And The Existing Riverview Facility

The EAW indicates that a different well (UN# 768109) exists within the Expansion Project footprint and has an existing DNR water appropriation permit for irrigation and livestock watering (Permit #2009-0492).[201] However, this well is not included in the EAW's list of "water sources," which lists only the Off-Site Well, stormwater collection/reuse, and water storage basins.[202] The amount of water that is used, or will be used, by this well is not stated in the EAW; per DNR comments on the EAW, it has an

[201] *Riverview's EAW for West River Dairy, supra* note 17, at 31. Although the EAW indicates that the well has an existing water appropriation permit, elsewhere in the document it describes this permit as "planned." *Id*. at 23.
[202] *Id*. at 35.

appropriation limit of 21.3 MGY for livestock watering and 64.4 MGY for irrigation.[203] There is an additional set of wells Riverview uses for livestock watering that is only obliquely mentioned in the EAW (as four commercial wells that exist at the current facility).[204] These wells, per DNR comments, have a water appropriation limit of 95 MGY, with permit number 2004-1023.

MPCA's analysis of groundwater quantity impacts focuses solely on the Off-Site Well. The EAW states that because the Off-Site Well is in a Quaternary Water Table Aquifer, and the five on-site wells are in the Quaternary Buried Artesian Aquifer beneath the Expansion Project site, that Riverview's approach to groundwater is "diversified."[205] As a result, MPCA did not consider the potential for cumulative impacts from the water withdrawals from the Off-Site Well and the five on-site wells on local groundwater resources.

This is a mistake. As DNR pointed out in its own comments on the EAW, the two aquifers are part of one connected system, and "water availability from these aquifers is limited."[206] Failing to fully describe the water appropriation from the on-site wells is a significant flaw in the EAW, and makes it more difficult to determine what the impacts of the Off-Site Well's water withdrawals will be on local groundwater resources. This problem is exacerbated because, as noted earlier, the most recent aquifer test is from 2007, and so it cannot be assumed to already include the usage of these wells.[207]

C. The Water Storage Basins Are An Inadequate Contingency For Appropriation Restrictions During Low Flow Events

The 2008 water appropriation permit for the Off-Site Well contains restrictions on pumping under certain flow conditions in the Pomme de Terre River, and these would be expected to also be incorporated into the new permit.[208] If pumping needs to be restricted, Riverview's plan is to use two water storage basins as a contingency measure, which would be filled from both the Off-Site Well and from stormwater collection.[209] This plan is not sufficient, and creates a serious risk that Riverview could overdraw from the Off-Site Well even when flow conditions are poor.

The drought conditions that could cause low flow in the Pomme de Terre River (and thus pumping restrictions) are also likely to reduce the amount of stormwater available to be diverted to the water storage basins. Minnesota has experienced severe dry conditions and drought in recent years, which will continue to worsen as the climate changes,[210] and so the risk of drought causing both low flow conditions and reduced stormwater availability is significant.[211]

An additional reason for caution is that Riverview has a history of causing groundwater depletion. Earlier this year, Riverview reached a settlement with the state of Arizona to reduce Riverview's groundwater usage, after Riverview's operations depleted local groundwater and left community members unable to

[205] *Id.* at 36.
[206] Kestner, *supra* note 181.
[207] Additionally, Riverview's plan to capture stormwater for use on the Expansion Project could also have an impact on groundwater recharge for the on-site wells; this possibility should also be evaluated by MPCA to determine potential impacts on groundwater resources. 2

use their own wells.[212] In Minnesota, a DNR technical report found that Riverview's proposed Twelvemile Dairy should not use a deep aquifer as a water source in part because "water levels at the nearby [Riverview] Dollymount Dairy continue to decline and have not yet stabilized."[213] Riverview exceeded its permit limits for pumping at the Dollymount Dairy in both 2020 and 2021.[214]

IV. AN EIS IS NECESSARY TO ASSESS WATER POLLUTION RISKS NOT ADEQUATELY DISCUSSED IN THE EAW

The EAW fails to accurately capture and mitigate the risks the Expansion Project has on water quality. Because of the potential for significant environmental effects on water quality, MPCA should require the Expansion Project to complete an EIS.

A. The EAW Does Not Consider All Pollutants Of Concern

Mega-dairies like the proposed Expansion Project are major sources of water pollution. Manure "is a primary source of nitrogen and phosphorus to surface and groundwater."[215] But, dairy waste is not just nutrients; it also contains a hazardous cocktail of sediments, pesticides, pharmaceuticals, salts, metals and ions such as magnesium, sodium, potassium, and chloride.[216] CAFOs also handle a variety of other potential pollutants including detergents and other chemicals.[217] When discharged to waters, these pollutants pose serious threats to human health and to ecosystems.[218] Yet, the EAW covering the

proposed Expansion Project does not consider impacts from any pollutants other than nutrients. The potential for adverse water quality impacts from other pollutants must be weighed in an EIS, especially because waters adjacent to the Expansion Project area are already impaired by E. coli and other pollutants associated with mega-dairy operations.[219]

B. The EAW Downplays Water Quality Threats Posed By Clay-Lined Basins

Riverview's plan to store manure and process wastewater from the proposed expansion in clay-lined basins is likely to cause significant environmental impacts that warrant consideration in an EIS. A growing body of evidence demonstrates that clay liners are insufficient protection against feedlot contaminants leaching to the subsurface.[220] As Riverview is well aware, designing and upkeeping a clay liner to comply with a 1/56 inch per day permeability standard is complicated by clay's tendency to crack during freeze-thaw cycles.[221] In Minnesota, such cycles are common due to extreme seasonal temperatures. Further, though feedlot operators frequently point to compliance with permeability limits as evidence that clay liners prevent pollution from reaching groundwater, these same operators are rarely willing to conduct groundwater monitoring capable of substantiating their claims. Indeed, the EAW does not contemplate that Riverview will conduct any monitoring to detect whether its clay liners are continually performing as designed. Clay lines, without monitoring, provide no assurance that Riverview's lagoons will not contaminate groundwater,[222] and clay liners absent monitoring is an insufficient mitigation[223]

Failure to impose discharge monitoring requirements is particularly concerning at the Expansion Project site because groundwater within the vicinity of the dairy is hydraulically connected to the Pomme de Terre River.[224] Even if Riverview is able to maintain compliance with the permeability limit, the proposed lagoons are so large that they will leach substantial amounts of pollution over the lifetime of the

Expansion Project.[225] Pollution that leaches to the subsurface is liable to contaminate not only soil and groundwater surrounding the basins, but also the Pomme de Terre River via subsurface hydrological discharges. MPCA must require that Riverview install synthetic liners with leak detection—as it has agreed to do for its Abercrombie Dairy in North Dakota[226] —to protect against subsurface discharges and the environmental hazards caused by such discharges. Additionally, MPCA must further investigate the interconnection between the basin sites and surface waters in the Pomme de Terre River basin before making a decision on the proposed Expansion Project.

C. The EAW Underestimates Water Quality Threats From Stormwater Management

If Riverview is permitted to store its waste in basins that are designed to—and will—leach pollutants to the subsurface, then its stormwater storage plans are seriously flawed. Of note, Commenters are limited in their ability to assess impacts that would result from Riverview's stormwater management because the facility's Stormwater Pollution Prevention Plan[227] was not included in materials made available for public comment. Nevertheless, at least one problem is evident from the EAW materials that were made available. Riverview plans to install a drain tile system to "control seasonal subsurface saturation" near the 35.2 acres of liquid manure storage basins where Riverview proposes to store nearly 150 million gallons of additional liquid manure.[228] This subsurface water will be diverted to one of the on-site storage basins and then released directly into the environment via a series of drainage ditches that ultimately flow to the Pomme de Terre River.[229]

Riverview's repeated claims that this stormwater is "clean"[230] are belied by their plan to construct the manure basins out of permeable (i.e. leaky) clay. Water that seeps into the ground surrounding the basins will be exposed to pollutants—including nitrates, dangerous pathogens, and pharmaceuticals that breed antibiotic resistant bacteria—that inevitably leach from the basins. Though the EAW makes vague references to "treatment" of this stormwater (an unnecessary step if the water were truly clean, as Riverview claims), but provides no details that allow Commenters or any other members of the public to evaluate the effectiveness of such treatment. This alone provides a sufficient justification for a harder look at the environmental impacts of the proposed expansion in an EIS.[231]

D. The EAW Does Not Disclose Or Evaluate Runoff Risks From Tile Drained Fields

All of the Expansion Project's manure application sites are also within the Pomme de Terre River watershed. The EAW does not consider how leaks from the hoses it uses to pump waste to these fields could impact water quality, nor are there monitoring requirements to ensure any such leaks are discovered and stopped in a timely manner.[232] But even if the hoses remain intact, the proposed expansion would substantially increase loads of contaminated runoff flowing from crop fields to the Pomme de Terre River and its tributaries. Extensive tile drainage installed on agricultural fields in the

area exacerbate runoff risks.[233] Notably, Riverview admits that it has not complied with the requirement to identify all tile inlets on the proposed manure land application sites.[234] The additional runoff caused by the expansion combined with subsurface leaching from the manure storage basins is likely to significantly increase cumulative impacts on the watershed. These impacts need to be fully assessed and disclosed to the public in an EIS before MPCA makes a decision about Riverview's expansion application.

V. MPCA MUST ORDER AN EIS TO ANALYZE THE CUMULATIVE EFFECTS OF THE EXPANSION PROJECT'S MANURE ON WATER QUALITY

The EAW is also incomplete because, in violation of the Minnesota Rules, it fails to analyze the Expansion's cumulative potential effects on water quality from manure application. The EAW avoids any true analysis of the effect of applying manure from an additional 11,000 dairy cows in the Pomme de Terre River watershed, a region that already has numerous feedlots and impaired waters. To comply with MEPA, MPCA cannot simply proclaim that the Expansion Project will have no cumulative effects on water quality—it must take a hard look at the potential for significant environmental effects. Thus far, it has not done so.

A. The EAW Shows That The Expansion Project Will Add Over 113 Million Gallons Of Liquid Manure To A Watershed Already Containing Impaired Waters

Riverview expects its additional 11,000 dairy cows to produce a truly extraordinary amount of manure—113,619,000 gallons of liquid manure and 15,400 tons of solid manure each year.[235] Combined with the existing feedlot, the expanded facility is expected to produce 202,744,000 gallons of liquid manure and 26,400 tons of solid manure each year.[236] This is far greater than the amount of waste produced by all the people in Minneapolis, Rochester, and Minnetonka combined.[237] That waste, of course, is treated, and ultimately discharged as clean water that meets water quality standards. Not so for Riverview's waste. Riverview intends to transfer the majority of the manure generated by the Expansion Project to 16,500 acres of non-Riverview owned or leased fields in Horton, Darnen, Synnes, and Scott townships within Stevens County, and on fields in Fairfield and Hegbert townships in Swift County. Notably, the Expansion Project is not the only large feedlot in this part of Stevens County. There are over 90 registered feedlots within the general area of the Expansion Project that also generate manure that needs to be managed, typically through land-application.[238]

The 113 million gallons of liquid manure will be added to an area where surface waters are already contaminated with the kinds of pollutants found in manure runoff. The Expansion Project is situated

within the Muddy Creek Subwatershed within the Pomme de Terre River Watershed. The fields identified to receive manure from the Expansion Project are located in the Muddy Creek Subwatershed, the Middle Pomme de Terre River Subwatershed, and the Dry Wood Creek Subwatershed. Since at least 2011, MPCA has known about the substandard water quality in this region of the Pomme de Terre River Watershed. The cause of this is clear: fewer natural landscape features and more intensive agriculture.[239] This region of the Pomme de Terre River Watershed has the most stretches of impaired waters and the highest nutrient concentrations and turbidity levels.

The Expansion Project is situated in the lower part of the Pomme de Terre River Watershed and the lower portion of the Muddy Creek Subwatershed, suggesting that the nearby waterways are already impacted by downstream effects from agricultural activities in the watershed's northern region. Additionally, many of the manure-accepting fields are near the Expansion Project or about 10 miles north of it, which will further increase phosphorus downstream in the watershed, particularly in the Lower Pomme de Terre River Subwatershed.[240] The EAW merely suggests that farmers who receive manure to be spread in areas near surface water with already phosphorus-polluted waters will follow the Feedlot Permit rules for land application, with testing every 4 years.[241] But even if all recipients do follow the permit rules, those rules do not attempt to eliminate all water pollution from land application of manure. Some pollution will certainly occur, and there is no consideration in the EAW for the downstream effects on the already polluted water.

Additionally, E coli is present at high levels in multiple reaches of water in the Pomme de Terre River Watershed.[242] Increased concentrations of E. coli in rivers and streams are primarily caused by animal waste, with sewage overflows and stormwater also contributing.[243] Over a decade ago, MPCA noted that Muddy Creek was one of two reaches where tests showed elevated concentrations of E. coli.[244] Studies of this area revealed a correlation between precipitation and E. coli concentrations, suggesting that runoff from manure spread on agricultural fields is largely to blame.[245] In this part of the state, MPCA estimates that a 49% reduction in E. coli is needed to meet water quality standards.[246]

The Lower Pomme de Terre River Sub Watershed has similar issues to the Muddy Creek Sub Watershed. The quality in this region is compromised by high turbidity and bacteria.[247] Turbidity is caused by suspended particles and large algal blooms, resulting in murky waters that can degrade water quality and harm aquatic life. These large algal blooms may be related to the high phosphorus levels in the watershed.[248]

Additionally, substantial evidence shows that water quality degrades progressively downstream within a watershed.[249] Although the Expansion Project is situated in the southern portion of the broader

watershed, it lies in the northern section of the Lower Pomme de Terre River Sub Watershed, meaning its pollution will inevitably flow downstream and further burden already impaired waters relied upon by downstream users. Yet the current EAW fails to meaningfully account for these downstream impacts. The EAW ignores the cumulative and compounding increases in nitrate and phosphorus pollution, overlooks the broader context of intensive regional agricultural activity, and minimizes the significant additional pollution that an Expansion Project would contribute. This omission understates the true environmental harm and risks, allowing further degradation of already vulnerable water resources

B. The EAW Does Not Adequately Address The Cumulative Effects Of Manure From All Feedlots In The Region

Minnesota Rules require than an agency consider "cumulative potential effects" in determining whether a project has the potential for significant environmental effects.[250] This means the agency must analyze "the effect on the environment that results from the incremental effects of a project in addition to other projects in the environmentally relevant area that might reasonably be expected to affect the same environmental resources, including future projects."[251] As the Rules note, even projects that are individually minor can create significant cumulative effects over time.[252]

The EAW, however, contains only a superficial and incomplete cumulative effects analysis regarding manure application in an already impaired watershed. The EAW recognizes that there is the potential for cumulative potential effects from "overlapping manure application and excess water usage."[253] The concern about manure over-application, however, is waived away entirely by pointing to the number of acres local producers have made available to receive the Expansion Project's manure.

This is an entirely insufficient analysis. For one, it wholly ignores on-the-ground data from this region of the state that reveals 73% of fields received an over-supply of manure,[254] with nearly 60% of fields receiving manure at nitrogen rates averaging 166 pounds per acre, well-beyond the recommended rate of 100 to 140 pounds per acre.[255] Since Riverview intends the Expansion Project's manure to be applied at fields owned or controlled by others, Riverview will not be able to guarantee that farmers follow best management practices or apply at agronomic rates. Thus, the analysis does not seriously consider that waters in the Pomme de Terre River watershed are already impaired, and that runoff from an additional 113 million gallons of liquid manure that will be applied each fall will almost certainly worsen the impairments already present in the watershed. Manure runoff is well known to contaminate surface waters with nitrate, phosphorus, ammonia, and fecal coliform bacteria (like E.coli), which can make water undrinkable, harm fish, cause algal blooms, and destroy aquatic habitats.[256] More than half of all Minnesota's surface waterbodies do not meet basic water quality standards, and non-point source pollution, like manure runoff from feedlots and fields, is responsible for about 85% of water pollution.[257]

The EAW also makes no attempt to examine how the combination of manure from the Expansion Project and manure from the approximately 96,300 animal units in the Pomme de Terre River

Watershed will affect water quality. While the EAW provides a map that identifies nearly 100 feedlots in the general area,[258] the EAW provides no other information about these nearby feedlots—such as how much manure they produce, where farmers apply that manure, and whether there is overlap with the fields receiving Riverview manure. Since manure cannot be cost-effectively transported far away, the manure from all these nearby feedlots is likely to be applied nearby. For a proper cumulative effects analysis, the EAW must examine "other projects in the environmentally relevant area that might reasonably be expected to affect the same environmental resources."[259] Here, that means other feedlots and how adding 113 million gallons of manure will impact an area where, presumably, farmers already allow a large amount of manure to fields. But the EAW failed to analyze other feedlots.

The contribution to already significant environmental degradation from the existing dairy is "significant when viewed in connection with other contributions to the cumulative potential effect."[260] The draft EAW itself fails to analyze many of the cumulative impacts, but publicly available information in the form of many agency studies over many years demonstrates the potential for significant environmental impacts on water quality from the addition of an enormous industrial feedlot in an already heavily impacted watershed. This must be studied in a detailed EIS that seriously considers alternatives before MPCA can permit the proposed project.

VI. MPCA MUST CONSIDER THE IMPACT THE EXPANSION PROJECT WILL HAVE ON THE DAIRY MARKET AND NEARBY ECONOMIES

Pursuant to Minn. R. 4410.1700 2a (A), MPCA should order an EIS and include within the scope of the EIS an assessment of the impacts the Expansion Project—in the context of larger expansion and consolidation trends—has on the dairy market and rural economies. MEPA requires RGUs to take "a 'hard look' at all the problems involved."[261] Although the EAW form guides the preparation and completion of an EAW, the assessment of environmental impacts is not limited by what the form asks. Rather, the assessment must consider all potentially significant environmental effects, even if not explicitly asked about in the EAW form.[262] Here, that includes assessing the effects the Expansion Project will have on the dairy market and the local economy.

The numbers are striking. In the last two decades, Minnesota has lost nearly 75% of its dairy farms,[263] even as the number of milk cows in Minnesota has remained relatively stable. Far fewer dairy farms exist now than before, but the average size of a Minnesota dairy farm has exploded.

Riverview is leading this charge to expand. According to MPCA's feedlot database, Riverview owns 15 dairy operations totaling more than 133,000 cows, with an average of nearly 9,000 cows per feedlot.[264] By comparison, the average dairy herd in Minnesota is approximately 280 cows,[265] meaning that the

average size of a Riverview feedlot is roughly 500 times larger. As a result of this consolidation, nearly 50% of milk cows in Minnesota are confined in the largest 8% of farms.

Consolidation impacts pricing and the ability for smaller dairies to access markets. Most dairy farmers sell milk to regional cooperatives or processors, using a federal pricing system based on marketwide supply and demand.[266] Mega-dairies like Riverview monopolize the market which, they may argue, allows for efficiencies that (at least initially) drive down costs. But monopoly agribusinesses are contrary to public policy and the health of the rural economy. Small dairies cannot compete in a monopolized business environment. Moreover, dairies selling milk to cooperatives or processers typically have a limited number of potential buyers (often just one) in their region.[267] Because milk is perishable and uneconomic for long-distance travel, dairies are constrained from accessing a cooperative or processer unless it is close to the farm.[268] As production becomes more consolidated, research shows that the number of buyers shrinks, limiting the geographies where dairies can sell milk.

Consolidation also impacts rural economies. A 1995 University of Minnesota study examined the impact of dairy farming on the community near Green Isle, Minnesota.[269] The study showed that, between the 1970s and 1990s, the number of farmers serving the local creamery dropped from 1,400 to 960 and larger farms started dominating the area. Economic and social activity in Green Isle plunged; between 1979 and 1989, retail sales dropped by over 80 percent and institutions like the public dance hall and the grade school permanently closed.[270] This is consistent with more recent assessments that conclude having more dairy farms is associated with a more positive economic and socioeconomic environment than higher dairy sales.[271]

These forces have impacted Minnesota's rural landscape. According to Minnesota Attorney General Keith Ellison, "when you hear about giant producers who are going to increase production drive prices even further down what it really means is that we are running small dairy producers out of business."[272] When a small dairy closes, Minnesota loses more than a supply of milk. "The closing of small dairy farms has contributed to the diminishing of small towns across greater Minnesota. Each closure has meant less demand for local mechanics, fewer students in the public schools, fewer farmers shopping at the local hardware store, fewer buyers at the local tractor dealer."[273]

Given Riverview's dominance in the Minnesota dairy market and its current effort to expand an existing facility to become the State's largest ever feedlot, MPCA's environmental review must consider how the Expansion Project will impact the dairy market and local economies. The EAW's silence on this issue means that it has "entirely failed to consider an important aspect of the problem."[274] Importantly, these consolidation efforts are not separate from environmental review.[275] A production model centered on

[275] Minn. Stat. § 4410.1200(E) (requiring EAWs to include "major issues sections identifying potential environmental impacts and issues that may require further investigation before the project is commenced") (emphasis added); *id.* § 4410.2300(H) (requiring an EIS to assess the "[e]nvironmental, economic, employment, and sociological impacts" for the proposed project).

fewer, larger operations concentrates manure generation, land-application pressure, air emissions, water demand, truck traffic, and energy use at particular sites and in surrounding communities. The EAW fails to evaluate whether the Expansion Project would further entrench this consolidated production model and whether that concentration would cause or contribute to significant environmental effects requiring further review.

Consolidation in industrial farming and agribusiness presents very significant economic and social repercussions for rural families and communities. Regulators can scrutinize large agribusiness to ensure the marketplace is fair through anti-trust laws.[276] But in Minnesota, MEPA also requires state agencies to consider these economic and social impacts before a project is approved. Because the draft EAW wholly fails to address this aspect of the problem, MPCA must order an EIS which will include an inquiry into Minnesota's dairy industry and the economic and social impacts consolidation, driven by Riverview, is having on the State.

CONCLUSION

To comply with Minnesota law, an EIS must be conducted to fully analyze the GHG emissions expected from the Expansion Project, their effects on climate change, and potential mitigation measures that could be used to reduce those effects. The EIS must also consider the water quality impacts attendant from appropriating over 200 million gallons of water per year from an aquifer hydrologically connected to the Pomme de Terre River. Additionally, an adequate plan to protect water quality from the massive amount of manure the Expansion Project will add to the Pomme de Terre River Watershed is required. The analysis must include a full assessment of the cumulative effects of applying so much additional manure to fields in a region where surface waters are already impaired with agricultural pollutants. Finally, the EIS must assess the Expansion Project's impact on the Minnesota dairy market.

Given all the missing and incomplete information in the EAW, MPCA currently cannot make an informed decision regarding the Expansion Project's potential for significant environmental effects. Accordingly, the undersigned organizations ask that MPCA order an EIS, so that the full effects of what would be Minnesota's largest CAFO can be fully reviewed.

A mistake was made by scheduling the public informational meeting in too small of a venue. I was an hour early and there were less than 10 scattered seats available. Ground water is a finate resource and there are already other large water usage industries in Steven's County. More and more farm land is being tiled which quickly drains rain water off the field so it is no longer seeping into the ground to replenish the ground water.

Extreme weather events are becoming more common due to climate change. Was there any reported manure over flow from the pit when Morris was hit with 16" of rain?

Stephanie Gausman **Letter 1291**

This expansion will put to much stress on the water table and other environmental impacts that will not be good.

Char Zinda **Letter 1292**

Water is not a renewable resource. It is the new gold for our lifetime and for our children and grandchildren. It affects much more than Riverview. Ease at the very least require an Environmental Impact Assessment Study. It is like dotting your I's and crossing your t's. It is you that we depend on.

Jamalea Martelle **Letter 1293**

My name is Jamalea Martelle, and I am writing in support of requiring the Minnesota Pollution Control Agency to conduct a full Environmental Impact Statement (EIS) for Riverview LLP's proposed West River Dairy Expansion.

I have had the privilege of experiencing this landscape through time spent with my husband and his family along the Pomme de Terre watershed and surrounding lands. Through waterfowl hunting, whitetail deer hunting, and time spent outdoors in this region, I have created lasting memories and developed a deep appreciation for the ecological value of this watershed and the wildlife it supports.

These experiences have also allowed me to witness the growing pressures placed on these landscapes over time. The Pomme de Terre watershed and nearby wetlands are vital habitat for migratory birds, deer, and countless other species that rely on these increasingly fragmented areas for survival. Protecting these lands and waters matters not only for conservation, but for the future generations who deserve the opportunity to experience and connect with these places the same way we have.

Given the unprecedented size of this proposed CAFO, the enormous water demand, and the proximity to already impaired waterways and protected wildlife areas, I believe a full Environmental Impact Statement is necessary. Minnesotans deserve a transparent and comprehensive review of the potential impacts to groundwater, surface water, wildlife habitat, local farmers, and rural communities before any decisions are made.

An EIS is a reasonable request for a project of this magnitude. It is a responsible step toward ensuring long-term protection of Minnesota's land, water, wildlife, and rural communities.

Thank you for taking the time to consider my comments.
Jamalea Martelle

Peter Kennedy **Letter 1294**

An Environmental Assessment Worksheet for a Confined Animal Feedlot Operation of this size is insufficient and an Environmental Impact Statement must be ordered.

The EAW is largely prepared with information provided by the petitioner and their contractors and is only focused on the CAFO in question. This casts the permitted activity in the best possible light and glosses over any negative impacts. An in independent assessment that includes this CAFO, the other CAFOs in the area and the impaired waterways in the affected watershed must be performed. The amount of water that is requested alone should trigger an EIS not to mention the nitrogen rich manure that will be applied through the watershed. The manure is applied largely in the fall when it has the greatest potential to leach nitrates into surrounding wells and waterways before it can be utilized by crops 6 months later in the summer.

No one is against progress, but when industrial agriculture progresses to this size then it needs to be regulated just like any other industry. Thank you.

Johanna Knorr **Letter 1295**

I am submitting the following comments on the West River Dairy Expansion Environmental Assessment Worksheet as both a resident of Morris and a lifelong dairy farmer. I have read the complete EAW, attended the MPCA's public information meeting on April 27, 2026, and reviewed several of the comments that have been submitted.

After reading the EAW, I appreciated the thorough, project-specific data and research that were compiled. I also noted that the Feedlot EAW template was updated in December 2024 and is more detailed and comprehensive than previous versions of the worksheet. I have been following several recent MPCA reports related to feedlots, and I believe it is important that this project be evaluated within the framework of these broader policy developments.

Compatibility with Minnesota's 2025 Nutrient Reduction Strategy (NRS)

Since 2014, many stakeholders—including the MPCA—have been working to improve water quality both locally and downstream. The 2025 Minnesota Nutrient Reduction Strategy (NRS) provides progress updates, establishes future goals, and outlines approaches for continued improvement. I would specifically like to highlight the following statement from page 158:

> "For the 2025 NRS, these best practices were reconsidered based on updated science and an assessment of their effectiveness, their potential to affect large acreages, and the multiple benefits they provide."

The West River Dairy Expansion incorporates three best practices identified in the NRS as having high total phosphorus (TP) reduction efficiencies.

1. In-Field Nutrient Management

Section 12.B.5.c.2 of the EAW identifies the use of precision knife-injection systems for liquid manure application. This practice is identified in the NRS as having a 35% TP reduction efficiency.

It is also important to recognize that the approximately 13,200 acres receiving annual manure application from West River Dairy will displace a comparable number of acres that are currently receiving commercial fertilizer. Manure application under this project will be closely regulated by the MPCA through a permit-required Nutrient Management Plan (NMP), including application rate limitations, timing restrictions, required setbacks from sensitive features, and mandatory cover crops or other best management practices (BMPs).

Commercial fertilizer sources, by comparison, are not typically subject to the same level of site-specific oversight. While I trust that farmers in my community are generally doing their best to responsibly

manage fertilizer use, it should be acknowledged that fields receiving manure are among the most closely regulated agricultural fields in the area.

2. Continuous Living Cover (Alfalfa and Cover Crops)

Section 18.B.1 of the EAW describes that the project will generate demand for approximately 2,200 acres of alfalfa. As of 2022, "other crops and hay" accounted for roughly 7% of all crop sales in Stevens County (USDA). While alfalfa is currently a minority crop compared to grains and oilseeds, the addition of a dairy operation that provides a stable, local market will incentivize increased acres of alfalfa production.

Conservation crop rotations, including alfalfa, are estimated to provide a 30% TP reduction efficiency.

The Draft Feedlot Permit (Section 18.4) requires that manure land-applied from June through September, and potentially through October 14, have a cover crop established within 14 days of application. Section 12.B.5.a.2 of the EAW identifies September 1 through November 15 as the primary manure application period, and Section 6.F.3 states that 13,200 acres will receive manure annually.

Based on this timing and permit structure, approximately 60% of application acres will require cover crops—equating to roughly 8,000 acres of new cover crops planted annually. Cover crop implementation is estimated to provide a 29% TP reduction efficiency.

3. Drainage Water Recycling

Section 12.B.4.b.5 of the EAW describes how the project will reduce sediment and nutrient runoff through stormwater pretreatment using sedimentation basins. The NRS estimates this practice has an 85% TP reduction efficiency.

In addition, Section 12.B.3.b of the EAW indicates that rainwater generated at the site will be captured and recycled for on-site use. This aligns well with the "multiple benefits" framework of drainage water recycling described in the NRS.

Cost and Public Benefit Considerations

The NRS estimates on page 154 that statewide adoption of best practices could cost taxpayers between $700 and $850 million per year if fully publicly funded. The practices proposed as part of the West River Dairy Expansion require no public funding. As a Minnesota taxpayer, I value that these privately funded practices will provide public water-quality benefits both locally and downstream.

Similarly, the 2026 Minnesota Climate Action Framework identifies the following priorities (page 54):

- Increase soil organic carbon and reduce erosion
- Manage fertilizer and manure to reduce emissions
- Manage farmland for multiple benefits
- Improve climate resilience through multi-purpose water storage and management
- Develop markets for climate-benefiting products

The practices described above—precision nutrient management, continuous living cover, and drainage water recycling—align closely with these stated priorities with no direct cost to Minnesota's taxpayers.

Context Within the Ongoing Feedlot Rulemaking Process

The MPCA initiated updates to Minnesota Rules Chapter 7020 in March 2025. Approximately one year later, priority areas within the rulemaking scope were identified. While final rule adoption may take several more years, the West River Dairy Expansion appears positioned to meet or exceed the

anticipated direction of the updated rules through requirements already included in the Draft Individual Feedlot Permit and practices described in the EAW. The relevant potential rules fell into 2 categories:

1. Land Application of Manure

The following requirements are addressed under the Individual Feedlot Permit:

- Transferred manure provisions
- Nitrogen BMPs
- Manure Management Plan applicability
- Visual field monitoring
- Recordkeeping requirements
- Application rate and location restrictions dictated by the MMP
- Manure sampling requirements dictated by the MMP

Regional zoning requirements are still under development; however, the EAW does not identify the project or receiving fields as being located in vulnerable groundwater areas.

2. Technical Standards

The Individual Feedlot Permit and EAW address the following technical standards:

- Manure storage capacity requirements
- Feed storage design and operation standards
- Livestock access to surface waters (not applicable, as this is a total confinement facility)
- Locational restrictions relative to sensitive areas (none identified)
- Enhanced manure storage design standards, including increased clay liner thickness and additional construction notifications

Presence of Existing Similar Operations

The proposed expansion would result in the largest dairy operation in Minnesota, a fact that has been cited in calls for preparation of an Environmental Impact Statement (EIS). However, size alone does not equate to environmental impact.

I have visited dozens of dairies across the country for personal, academic, and professional reasons. In my experience, herd size is not correlated with either animal care or environmental performance. Smaller farms are not inherently “better,” nor are larger farms inherently “worse.” Environmental outcomes are driven by the combination of regulatory standards and the integrity of ownership and management.

Minnesota has extensive regulatory requirements, as demonstrated by the hundreds of pages of documentation in this EAW, and is actively expanding oversight through rulemaking. The EAW did not identify any significant environmental impacts that would warrant preparation of an EIS.

Comparing similar projects does not fall within the formal scope of this EAW, but it seems relevant that comparable operations exist. The original West River Dairy, constructed in 2004, was one of the largest feedlots in the state at that time and has operated successfully and in compliance for over 20 years. This pattern has been repeated in other Riverview LLP dairy projects throughout Minnesota—large-scale facilities that have functioned with regulatory compliance and demonstrated environmental responsibility and operational integrity.

Conclusion

Based on the information presented in the EAW and the Draft Feedlot Permit, the West River Dairy Expansion is consistent with Minnesota's published environmental initiatives, including the Nutrient Reduction Strategy, the 2026 Climate Action Framework, and the known scope of the Animal Feedlots Rulemaking process. The project proactively incorporates many of the practices that Minnesota's agricultural community and state agencies should be encouraging to improve water quality.

For these reasons, I urge acceptance of the EAW as published, without requiring preparation of an Environmental Impact Statement.

Thank you to the MPCA for your work both in reviewing this project and providing Minnesota with the framework to evaluate projects and work together to protect Minnesota's air, water, land, and climate.

Travis Moser **Letter 1296**

Dear Commissioner Kessler and Commissioner Petersen:

We are residents of western Minnesota, eastern North Dakota, and eastern South Dakota, representing generations of farmers, business owners, and communities writing to share our strong support for Riverview's proposed West River Dairy expansion and to offer our perspective as you consider the project's path forward.

Many of us have spent our lives working this land, growing crops, raising livestock and building our livelihood here. We understand firsthand the importance of protecting our natural resources while also sustaining the farms, families, and local economies that depend on them. That balance matters deeply to us, and it is why we support this project.

Riverview is not new to our communities. They have a long track record of operating with care for the land, respect for animals, and a genuine commitment to the people and rural communities where they live and work. We have seen their approach up close: investing in environmental stewardship, partnering with local farmers, and contributing to the long-term vitality of the region.

The proposed West River Dairy expansion has undergone extensive and rigorous review. The Environmental Assessment Worksheet (EAW) and feedlot permit application together include nearly 900 pages of detailed technical analysis, developed over more than three years in coordination with state

agencies. The project is subject to oversight from multiple agencies, including the MPCA, DNR, and MDH, ensuring a comprehensive evaluation of groundwater, surface water, air quality, and natural resources.

In addition, the farm will operate under an individual NPDES feedlot permit – one of the most stringent and site-specific permits in Minnesota – and includes enhanced environmental protections that go beyond baseline requirements. Riverview has also taken proactive steps to reduce impacts, including voluntarily cutting permitted groundwater use in half and incorporating stormwater capture and reuse into the project design.

Based on what we know and what has been studied, we believe the current environmental review process is thorough, science-based, and appropriate for this project. An Environmental Impact Statement (EIS) should be reserved for situations where the evidence clearly demonstrates it is necessary. In this case, we are confident the existing process provides a full and careful evaluation.

For our communities, this project is also about the future, supporting family farms, creating economic opportunities, and strengthening our rural areas for generations to come. Riverview's model of working with neighboring farmers and investing locally reflects the kind of agriculture we want to see continue and grow.

We appreciate the seriousness of your roles and the responsibility you carry in reviewing projects like this. We respectfully encourage you to rely on the extensive environmental review already underway and the strong record of stewardship demonstrated by Riverview.

Thank you for your time and consideration.

Sincerely,

Ronald Visser **Letter 1297**

Ronald Visser

Go on a tour! Riverview does them on every dairy. This is the best way to fully understand the dairy operation.

What you will see is:

A great cow environment-the barns are designed with cow comfort as top priority. The cows are calm when milking. They have access to feed, water, and a bed all day.

A great employee culture-the team is professional, hardworking and loves the cows.

A clean site-the farm is well organized, kept clean and well maintained.

A great manure plan-the manure lagoons are covered to control odor and to keep precipitation and manure separate; the lagoons have plenty of storage capacity-14 months. You might see manure injected into the soil after harvesting in the fall.

No rodents-the clean facility along with a pest control program keeps rodents in check.

Very few flies-the clean facility, constant air flow in the barn and a fly control program limit the flies.

My parents built a new 60 cow tie-stall barn in 1973 when I was 3 years old. I've been told that our county had 175 dairy farms at the time. 7 milk processors competed for our milk. Today, none of those farms have dairy cows. The entire dairy infrastructure (processing, veterinarians, nutritionists, consultants, ag lenders-dairy, equipment dealers/repairs, etc.) is gone. I have watched a similar transition in the far north of Minnesota, all of North Dakota and Black Hill area in South Dakota. Very few dairy farms remain in these areas, and the infrastructure is far away or gone. Milk processing left drove most of this.

I have spent my entire life in the dairy industry. I have witnessed the transition from tie-stall barns to larger free-stall barns in the Midwest. Most of the traditional cow regions in the Midwest and Northeast

are now a blend of both. This trend will continue as small tie-stall barns get replaced with larger free-stall barns. The dairy infrastructure here is good.

The dairy industry has had regions in Idaho, Texas, Indiana, South Dakota and Kansas where the dairy infrastructure took off or is taking off. The harsh reality is that these new pockets of dairy rarely include the addition of small dairy farms. What we have currently in the United States dairy industry (and Global) are traditional cow regions, areas that are losing and areas that are gaining.

Riverview plays a huge role in maintaining a healthy dairy infrastructure in Minnesota. The dairy industry in Minnesota is stronger because of Riverview. Making it more difficult, or impossible, for Riverview, or any other dairy operation, to obtain permits to operate in Minnesota will result in the movement of dairy infrastructure and the dairy industry somewhere else. Making it less difficult for Riverview, or any other dairy operation, to obtain permits to operate in Minnesota will result in the movement of dairy infrastructure and the dairy industry into Minnesota.

The dairy industry is no different than any other industry as it relates to the environment. We have become better stewards of the land through knowledge and regulations. You can still find people or businesses that have complete disregard for the environment. The next level for me is those that are willing to follow the rules. Most farmers that I know are above these levels as they do their best to be efficient and follow practices that are positive for the environment. The next level for me is doing things to improve the environment that add cost to their business. The ultimate level is where you can find Riverview. The environmental impact is considered in every decision that they make, often resulting in additional costs and reduced efficiency.

I would like to see the dairy industry grow in my home state of Minnesota. I live a mile from a Riverview site. I breathe the air and drink the water from my well. Yes, I appreciate the protections in place for our environment. The rules need to be in place and verified for the first two levels mentioned in the previous paragraph. We don't need additional regulations for those like Riverview at the ultimate level. We do need to explore ways to make it easier (or an option) to grow for those "good farmers" at level 3 or 4 above. I don't see that right now in Minnesota. I do see our neighboring states provide this opportunity.

Riverview plays a huge role in supporting other agriculture infrastructure and other agricultural industries in Minnesota as well. The farmers next to the dairy benefit in many ways: manure as fertilizer for improved soil health, additional cropping options with corn silage and alfalfa haylage, and use of machinery and labor during forage harvest and manure application. This reaches further with the use of by-products from corn and soybean processing as food sources for dairy cows.

The additional cows proposed as part of this expansion are not introducing anything new or untested. Riverview has extensive experience managing operations of this size safely and responsibly. The current Environmental Assessment Worksheet (EAW) process is doing exactly what it is intended to do—evaluating potential impacts and ensuring environmental protections are in place. Based on the proven track record of Riverview and the safeguards provided through the EAW process; this expansion does not warrant a full Environmental Impact Statement (EIS). The existing environmental review process already provides adequate protection for Minnesota's natural resources while allowing responsible agricultural operations to move forward. Riverview Farms has shown that agricultural growth and strong environmental stewardship can go hand in hand. I respectfully encourage the MPCA to consider their outstanding environmental record and support the proposed West River Dairy expansion. Thank you for your time and consideration, and for the important work you do to protect Minnesota's environment.

A concerned Minnesota resident **Letter 1298**

Minnesota's First and Largest Proposed Livestock Facility

Demand for Environmental Impact Study

P A R T O N E — T H E T H E M E

Minnesota Has Never Seen Anything Like This. That Is Precisely the Point.

Minnesota dairy farming is woven into the identity of this state. On a typical Minnesota dairy in 2025, a family averages fewer than the average 280 cows. They know their herd. They know their neighbors. They know the watershed. They have made generations of careful decisions about how much to take from the land and how much to give back.

What Riverview, LLP is proposing is not a larger version of that farm. It is not a bigger barn or an extra milking parlor. What Riverview is proposing is a facility that would house 18,855 dairy cattle, totaling 26,397 animal units, in a single location. That is nearly double the size of the next largest livestock operation in the entire state of Minnesota. It is more than 60 times the size of the average Minnesota dairy. It would be, from the day it opens, the largest livestock facility Minnesota has ever seen.

> *This is not a farm expansion. This is the industrialization of Minnesota agriculture at a scale this state has never confronted and is entirely unprepared to regulate without a comprehensive Environmental Impact Study.*

And here is what we know with certainty, backed by decades of peer-reviewed science: at this scale, in this concentration, the environmental consequences of a dairy operation are categorically different from what an average family operation of the average 280 cows produces. The water impacts are different. The air quality impacts are different. The public health risks are different. The threat to neighboring farms and rural communities is different.

Minnesota's families, farmers, rural residents, schoolchildren, and people who draw their water from the aquifers and streams of the affected watershed deserve to know what those differences are before the facility is built. Not after. Not once have the wells been drawn down, and the manure lagoons have been constructed, and the 26,000 animal units are in place, and the consequences have become irreversible.

The demand before you today is the most modest, reasonable, legally grounded request that can be made in the face of a proposal this large: conduct a full Environmental Impact Study before a single shovel breaks ground.

P A R T T W O — T H E S T O R Y O F T H E E V I D E N C E

What the Science Tells Us — And Why Scale Changes Everything

The evidence in this matter is not drawn from a single study, a fringe journal, or an advocacy organization. It represents the convergent findings of dozens of independent, peer-reviewed scientific studies conducted across the United States, Europe, Asia, New Zealand, and Latin America. Wherever researchers have examined what happens when dairy operations reach mega-scale, they have found the same patterns. What follows is the story that evidence tells, about water, health, the land, and the communities that depend on all three.

Chapter One: Scale Is Not Just a Number, It Is a Threshold

To understand why 26,397 animal units in one place is qualitatively different from the average 280 cows on a family farm, consider the arithmetic of waste. A single dairy cow produces approximately 120 pounds of manure per day. Riverview's proposed facility, with 18,855 dairy cattle, would generate on

the order of over one million pounds of manure every single day, waste that must be stored in lagoons, applied to fields, and managed in a watershed that has never absorbed anything remotely close to that volume.

The science of nutrient loading is precise on this point. As dairy intensity expands in a watershed, phosphorus loads, the primary driver of toxic algal blooms, have been shown to increase by as much as 91%.[Waller et al., 2021] Studies measuring stream water quality downstream of dairy CAFOs found dissolved nitrogen concentrations eight times higher downstream than upstream during manure application periods. [Sousan et al., 2021] Manure lagoons, which a facility of this size would require at a massive scale, have been documented contributing between 6% and 12.6% of a region's total groundwater nitrogen load while occupying just 0.8% of the land surface. [Baram et al., 2014] Now multiply those impacts by the difference between an average 280- cow farm and an 18,855-cow facility.

Chapter Two: The Groundwater Threat Is Documented and Severe

Minnesota's rural communities depend on groundwater. The families, farms, and small towns near the proposed facility draw their drinking water from wells. Those wells tap the same aquifer system that a facility of this scale would draw upon and potentially contaminate.

The science is unambiguous about what mega dairies do to groundwater. Nitrate concentrations beneath dairy operations have been measured at an average of approximately 64 mg/L, nearly three times the EPA's maximum contaminant level of 10 mg/L for drinking water. [Harter et al., 2002] In California's Central Valley, a region with significant experience with large dairy operations, dairies are identified as major contributors to domestic well contamination. [van der Schans et al., 2009]

And contamination is not limited to nitrates. Groundwater near dairy operations has been found to contain sulfonamide antibiotics [Batt et al., 2006], steroid hormones transported from waste lagoons to depths exceeding 30 meters [Arnon et al., 2008], antibiotic-resistant bacteria and genes [Meyer et al., 2024], and PFAS, the "forever chemicals", documented in groundwater near large livestock operations. [Wang et al., 2025] These are not isolated findings. They are a consistent pattern that repeats wherever mega dairy operations and aquifers intersect, and Minnesota's aquifers would be no exception.

Critically, the research documents that groundwater contamination from intensive livestock farming can have legacy effects with lag times exceeding 20 years.[Kim et al., 2021] The full consequences of today's permitting decisions may not fully appear in Minnesota's water supply for two decades. By the time the harm is visible, the facility will be entrenched, the contamination will be established, and the opportunity to prevent it will be gone.

Chapter Three: The Surface Water and Watershed Damage

Minnesota's lakes, rivers, and streams are not just ecological assets; they are cultural and economic ones. The state's identity, its tourism economy, its fishing heritage, and its agricultural water supply all depend on the quality of surface water in its watersheds.

The nutrient loads from a facility of 26,397 animal units, the manure, the runoff from feed storage, and the effluent from milking operations would enter Minnesota's watershed through multiple pathways. The science documents what happens when those loads arrive. Phosphorus and nitrogen fuel eutrophication: the systematic suffocation of aquatic ecosystems by algae that strip oxygen from the water, killing fish, generating toxic blooms, fouling drinking water sources, and degrading the ecological function of lakes and rivers for generations.

Pathogens follow the same runoff pathways. E. coli O157:H7, Cryptosporidium, Giardia, and fecal coliforms enter waterways through manure runoff and field applications [Mohammed et al., 2023;

Mausbach et al., 2025], creating direct risks for downstream communities. Pharmaceutical residues, such as estrogens, NSAIDs, and antibiotic compounds, are routinely detected in surface water runoff from manure-amended fields at concentrations sufficient to cause endocrine disruption in aquatic organisms. [Havens et al., 2020; Hill et al., 2021] Minnesota's fishing culture and recreational water economy have no margin for this.

Chapter Four: The Human Health Evidence Is Not Speculative

The people who would live within one to two miles of this proposed facility farm families, rural residents, schoolchildren, elderly neighbors face documented health risks that accumulate with proximity and time.

Air quality monitoring at homes within a quarter mile of industrial dairy operations found ammonia concentrations eight times higher and cow allergen concentrations sixty times higher than at homes three miles away. [Williams et al., 2011] Children with asthma demonstrate measurable declines in lung function on the day after elevated CAFO emissions events. [Loftus et al., 2020] Adults with COPD experience acute lung function drops exceeding 20% following ammonia spikes from nearby operations. [van Kersen et al., 2020] Residents within 1.5 miles show significantly higher rates of asthma, allergies, and persistent lung function decline. [Schultz et al., 2019]

In regions with high livestock density, physicians document higher rates of pneumonia and other infectious diseases among nearby residents. [Hooiveld et al., 2016] A 2026 study across three U.S. states found higher cancer incidence in counties with greater CAFO density. [Son et al., 2026] And the antibiotic resistance threat driven by the documented presence of up to 21 classes of veterinary antibiotics in dairy-associated watersheds [Lee et al., 2020] represents one of the most serious emerging public health threats of our time. A facility producing at the scale proposed here would be a significant driver of that threat in Minnesota's environment.

Chapter Five: What Riverview Has Already Done Elsewhere

We do not need to speculate about how Riverview, LLP behaves when its operations reach a scale that strains the surrounding environment. We have a documented case study. In Arizona.

On December 31, 2025, just months ago, Riverview, LLP entered into a formal Settlement and Release Agreement with Arizona Attorney General Kristin Mayes. The Attorney General had invoked her authority under Arizona's public nuisance statute based on expressed concerns that Riverview's existing groundwater pumping in the Sulphur Springs Valley of Cochise County constituted a public nuisance. The settlement's own recitals acknowledge that groundwater levels in the Valley "continue to decline" and that Valley residents' domestic wells "no longer reach the aquifer." Arizona's own water resources agency found conditions serious enough to designate the affected basins as Active Management Areas, a designation reserved for regions facing critical groundwater depletion.

The result: before Riverview could proceed, the state of Arizona extracted $11 million in remediation commitments, $5.5 million to an independent charitable fund for residents and schools affected by groundwater decline, and $5.5 million administered directly for those closest to Riverview's irrigation wells. Five Valley schools were specifically identified as needing emergency water access assistance. Riverview also committed to removing 2,000 acres of irrigated farmland from production over 15 years.

> *Riverview paid $11 million in Arizona to address what its existing operations already did to that state's groundwater — before adding a single animal. Minnesota is now being asked to permit a facility nearly double the size of anything that state has ever seen, with no comparable assessment of what it will do here.*

To be precise: Riverview denies liability in the Arizona matter. The settlement is not a legal admission. But the Attorney General of the State of Arizona with the full resources of her office found the evidence of groundwater harm serious enough to pursue formal legal action under the state's public nuisance statute That is not a fringe claim. That is the considered legal judgment of a state's top law enforcement officer about Riverview's existing operations. And now Riverview is asking Minnesota to permit a facility that, by its own application, would be the largest livestock operation this state has ever seen.

P A R T T H R E E — T H E S I G N I F I C A N C E

Why This Matters: Minnesota Does Not Get a Second Chance

Some harms can be remediated. You can clean a spill, relocate a facility, adjust a management practice. Aquifer depletion, watershed contamination, and the destruction of rural communities are not those kinds of harms.

When an aquifer is drawn down beyond recovery within a human lifetime, the water does not return. Wells that took families years to install become useless. The agricultural economy of a region, built across generations, can be permanently compromised. Nitrate contamination once established in a groundwater system can persist for decades, affecting the neurological development of infants, the health of elderly residents, and the viability of neighboring farm operations. Studies document legacy contamination effects with lag times exceeding 20 years. [Kim et al., 2021] By the time the full damage is visible, the facility will be entrenched, the permits will be issued, and the opportunity to prevent harm will be a memory.

The economic consequences for Minnesota's rural communities would be profound. A 26,397- animal-unit facility doesn't just compete with family dairies for water it competes with them for land, for local labor, for community identity. The research is clear that mega dairy operations tend to reduce total employment per unit of output relative to smaller farms, concentrate land ownership, weaken local supply chains, and generate community tension that undermines the social fabric rural areas depend upon. The average 280-cow farm that has sustained Minnesota's dairy heritage for generations cannot compete on the same terms as a facility that is 60 times its size and externalizes its environmental costs onto the surrounding community.

And the threat is not merely to this one watershed, or this one community, or this one permitting decision. This is the first proposed livestock facility of its kind in Minnesota. If it is permitted without a rigorous Environmental Impact Study, if the precedent is established that a 26,000-animal-unit facility can be sited and built without a comprehensive, independent, public assessment of its consequences, then every future applicant for a comparable facility will point to this decision as the standard. The precedent set here will shape Minnesota's agricultural and environmental landscape for a generation.

> *An Environmental Impact Study is not a weapon against agriculture. It is the mechanism a responsible state uses to ensure that its most consequential decisions are made with eyes open — not discovered in hindsight.*

P A R T F O U R — T H E C R E D I B I L I T Y Q U E S T I O N

If the Science Is Wrong, Why Won't They Let Us Check?

Riverview and its advocates will argue that the science is overstated. That their operation is well-managed. That they use the best available technology. That an Environmental Impact Study is unnecessary, burdensome, and punitive. That this is just opposition to progress dressed up as environmental concern.

Consider that argument carefully because embedded within it is a question they have not answered and do not want you to ask:

> *If this facility poses no significant environmental risk to Minnesota's water, air,land, and communities a rigorous, independent Environmental Impact Study willprove it. So why fight one?*

The Environmental Impact Study process is not a presumption of guilt. It is a neutral scientific and regulatory assessment. It requires independent experts, not the company's consultants, not the company's attorneys, not the company's hired engineers, to evaluate the projected impacts on groundwater, surface water, air quality, public health, and community welfare. If Riverview's facility truly poses no significant harm, the Environmental Impact Study will say so. The permit will be granted with public confidence and legal protection.

The only reason to oppose an Environmental Impact Study is if you fear what it will find.

The Efficiency Argument Is Incomplete

Riverview will point to its conservation practices, and some of them are genuinely meaningful. The 2025 Arizona settlement documents center-pivot systems, low-energy precision application, and variable-frequency drive pumps. These are real technologies with real water efficiency benefits.

But there is a critical distinction that efficiency arguments consistently obscure: per-unit efficiency gains do not offset the aggregate impact of scale.[Rotz et al., 2024; Han et al., 2024] A facility that uses 15% less water per cow but concentrates 18,855 cows in a single location draws dramatically more water from the aquifer system than any collection of smaller farms that those cows would otherwise replace. The manure volume is not reduced by efficiency technology, it is concentrated. The ammonia emissions are not eliminated; they are concentrated. The pathogen load in runoff is not neutralized it is concentrated. Concentration is the variable that an Environmental Impact Study must evaluate. It is also the variable Riverview does not want evaluated.

The Regulatory Gap Problem

The research literature on CAFO oversight is striking in its consistency across states and decades. Federal databases on the number and location of CAFOs are incomplete.[Chugg et al., 2021] Permitting rates are low even for large operations. Inspection rates have declined sharply since 2011. Most compliance monitoring relies on operator self-reporting the very operator with a financial interest in favorable findings. [Glibert, 2020; Moran, 2022] State preemption laws in many jurisdictions block local governments from imposing stricter standards than the state minimum, creating what researchers call "regulatory vacuums" that leave communities with no meaningful recourse. [Moran, 2022]

Minnesota has never permitted a facility of this scale. It has no track record with a livestock operation of 26,397 animal units, no established monitoring infrastructure calibrated to impacts of this magnitude, no regulatory precedent for enforcing against a facility that dwarfs anything that has come before. The Environmental Impact Study is not just about understanding the facility's environmental impacts it is about determining whether Minnesota's regulatory framework is even equipped to manage them, and what additional protections would be required before a permit could be responsibly granted.

The Arizona Track Record Cannot Be Dismissed

Riverview will argue that Arizona is a different state, a different climate, a different hydrogeology. And that is true as far as it goes. Arizona's desert aquifers face different pressures than Minnesota's.

But the Arizona settlement does not prove a specific quantity of harm in Minnesota. What it proves is something more fundamental: that at the scale Riverview operates, the company's activities can deplete

groundwater to the point where a state Attorney General pursues formal public nuisance litigation, where domestic wells go dry, where schools require emergency water assistance, and where $11 million in remediation is required before anyone agrees to stop investigating.

That is a pattern of conduct. It occurred with Riverview's existing operations not with a proposed expansion. Minnesota is now being asked to permit a facility the applicant itself describes as nearly double the size of the next largest livestock operation in the state. The Arizona experience is not a disqualifier. It is, precisely, the reason an Environmental Impact Study is necessary.

The Environmental Justice Dimension

The communities that bear the greatest burden from mega dairy operations are consistently documented to be rural, lower-income, and in many cases, communities of color or Indigenous communities with the least political capacity to demand accountability. [Driscoll & Theis, 2020; Hudlet-Vazquez, 2025; Tulbure et al., 2024] Rural Minnesota families are not corporations. They cannot hire hydrogeologists, retain legal teams, or absorb the cost of a failed well while litigation proceeds. They depend on the regulatory process on the Environmental Impact Study to ensure their government is looking out for them before the damage is done, not after.

When we ask why Riverview opposes a full Environmental Impact Study, part of the honest answer is this: the people who bear the cost of getting this wrong are not the people deciding to build. That asymmetry between who profits and who pays is precisely the asymmetry that environmental review processes were designed to address.

P A R T F I V E — T H E C A L L T O A C T I O N

The Demand Is Reasonable. The Stakes Are Not.

We are not here to end dairy farming in Minnesota. Agriculture is the backbone of this state's economy and identity. Minnesota's dairy farmers, the real ones, the average 280-cow operations that have sustained rural communities for generations, deserve a future. And that future is not served by permitting a single corporate facility that is 60 times their size to externalize its environmental costs onto the land, water, and communities those farmers share.

What we are asking for is not extraordinary. It is not punitive. It is not a backdoor attempt to block development. We are asking for what the law provides, what the science demands, and what any reasonable observer looking at a proposed 26,397-animal-unit facility that would be the first and largest of its kind in Minnesota would recognize as the minimum due diligence owed to the people of this state.

Is it so much to ask for a full Environmental Impact Study conducted independently, reviewed publicly, and completed before a single permit is issued and a single shovel breaks ground?

Minnesota's environmental and community interests.

The Legal and Moral Standard

Environmental review processes exist because Minnesota and the federal government made a foundational decision: when an action is large enough to cause significant environmental consequences, the public has the right to know what those consequences will be before the decision is made, not after.

A facility of 26,397 animal units, the first of its kind in Minnesota, nearly double the next largest operation in the state, 60 times the average dairy, proposed by a company that is already paying $11 million in remediation for groundwater impacts in another state, is precisely the kind of action this standard was designed to address.

The burden in this proceeding does not fall on Minnesota's farmers and families to prove that this facility will cause harm. The burden falls on the applicant to demonstrate, through a rigorous and independent process, that it will not.

> *Minnesota has never faced a livestock facility of this scale. It will never get a second chance to make this decision correctly. Require the Environmental Impact Study.*

We are asking you to require what the law contemplates, what the science demands, and what Minnesota's rural communities deserve: a full Environmental Impact Study before the largest livestock facility in this state's history is permitted to become a permanent feature of Minnesota's landscape.

The family farmers whose livelihoods border this proposed site, the parents whose children will breathe the air within two miles of 26,000 animal units, the neighbors whose wells draw from the same aquifer those Minnesotans cannot afford for you to get this wrong.

Require the Environmental Impact Study. Demand the full picture. Do not let the largest environmental decision Minnesota's agricultural communities have ever faced be made in the absence of the information they are owed.

Settlement reference: Settlement and Release Agreement, State of Arizona ex rel. Attorney General Kristin Mayes v. Riverview, LLP, effective December 31, 2025. Riverview expressly denies liability. The Arizona settlement is not an admission of fault or unlawful conduct and pertains to Riverview's existing Arizona operations, not the proposed Minnesota facility.

Logan Visser **Letter 1299**

My name is Logan Visser and I am an employee of Visser Trenching, a construction company serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Through our work in the agricultural sector, we depend on a strong and stable livestock industry. Operations like Riverview's create consistent economic activity that supports local jobs, drives investment, and allows businesses like ours to grow and reinvest in our communities.

The proposed expansion represents a meaningful economic benefit to the region. It will generate demand for local vendors, support both construction and long-term employment, and contribute to the vitality of rural communities that rely on agriculture.

From our direct experience, Riverview is a professional and reliable partner that contributes positively to the communities where it operates. Their presence strengthens the local economy and supports a broad network of agricultural and service-related businesses.

Projects like this are essential to maintaining a competitive and sustainable rural economy in Minnesota. Continued investment in agriculture ensures that local businesses can continue to provide jobs, services, and economic stability close to home.

No EIS is needed as the state environmental review process is rigorous and very sufficient. I respectfully encourage your support and approval of this important project.

Overall I believe that without projects and developments in the agricultural industry such as this one, the local economy is at a deficit.

Sincerely,
Logan Visser

Max Lundgren **Letter 1300**

Thorough review is absolutely essential before any project! We have a gold standard, stick to it! No shortcuts!

Glen Visser **Letter 1301**

My name is Glen Visser and I am the owner of Visser Trenching a Excavation and service company serving agricultural operations in Minnesota like Riverview. I am writing in support of their proposed West River Dairy expansion in Stevens County.

Sandra Fernow **Letter 1302**

My name is Sandra Fernow. I am a current resident of Morris, and have been for the past 10 years. I have two kids, age 8 and 5, who were born at the local hospital, and now our family has come to call this place home. I may not be a farmer, but I do have a career in housekeeping, so I care about ensuring the community has a clean, safe environment to thrive in. I waited until after I had attended the MPCA public comment meeting at Old No One Southside on April 28th to submit my comment. I have to inform you that I was one of the last to enter the room before the doors were closed for the extent of the public comment meeting, and I had arrived about 15 minutes early. I was guided to standing-room-only, from where I had a vantage point of the main entry door. There were waves upon waves of concerned citizens who attempted to come to the meeting to be better informed, and/or to make their concerns, questions, or whatever else be heard, and their entry to the venue was denied due to the Southside being at capacity. I watched some friends, some community members, and more I didn’t recognize, have their whole body demeanor sink as they heard the news that they were not allowed to enter the “public” comment session. I won’t forget their faces. This experience left me frustrated, and I believe it revoked some of the voice of the community and other farmers, and effectively silenced their concerns or potential opposition to the proposed expansion. Even now, amongst the public comment period board, there are many submissions stating “No EIS needed, I support West River expansion” type

of a generic comment; it makes it feel like that same moment, of filling the space in a similar manner so it's harder to see the worries people may have surrounding this.

An old college acquaintance of mine first messaged me in September of 2025, directing me to a video on some of the less-than-ideal impacts that Riverview had done to the community in Arizona; this video was put together by Perfect Union, and posted April 25, 2025 on their Instagram. The first example in the video, an Arizona resident, had their well run dry due to Riverview's over-usage of groundwater there, so the resident had no running water in their home for 6 months. This person had hoped to pass their house down, a stability for generations, but feared they could no longer do so due to the manner in which their land was impacted. I saw an article from January of this year, that Riverview reached an agreement to reduce groundwater usage and pay $11 million to affected residents in AZ over 20 years; but is money enough to repair damage to our natural world? Does money paid after-the-fact undo damages which dictate how we leave the land for our children? At what point are we crossing the line here, away from being farmers and into something more reminiscent of resource miners, extracting the land and exchanging it for the all-mighty dollar? Are there things which could be done unto our local land out here, thanks to decisions made by investors, which could be irreversible?

These sort of questions is why I think we need an Environmental Impact Statement.

I'm concerned about Water Quality, as a recent story from Minnesota Public Radio described in their headline, "Nitrate is quietly polluting rural drinking wells. How researchers are working to help." I may live in town, but have daydreamed about buying property somewhere out of town for more room to garden and enjoy nature's bounty, so I'm concerned about rural groundwater quality. Groundwater pollution is especially difficult to filter, needing expensive equipment a lot of people probably can't afford. I worry that surface water could be polluted as well, impacting local hunters and outdoors-people who want to enjoy what western MN has to offer. The manure runoff from factory farms can have a big impact on putting nitrates in water. I think the community should be able to achieve a sense of security, in having detailed and clear answers to the many questions they may have. CAFOs (or Concentrated Animal Feeding Operations) are notorious for contaminating water with nitrates, and I have real concern that a massive operation such as this could potentially pollute our area in a way that impacts our precious resources for years, and generations, to come.

Ground water and surface water contamination is a greater risk with factory farm style projects of this size, and I'm concerned about our water resources being negatively impacted with such a massive expansion. The types of pollutants associated with potential spills concern me, because of their environmental impact to wildlife in the form of algae blooms, and the increased risk of cancer rates associated with nitrates. I know fisherman friends who have shared Snapchat videos to their story while out at the lake and along the Pomme de Terre watershed near here, and possibly north of town, which depicted algae of an unnatural color along the shore line. Another concern I have for stability of the land is for future generations out here, because Blue Baby Syndrome is caused by drinking from nitrate-contaminated water wells. I worry, also, as a "townie" here, about how well our own municipal water facility is capable of filtering out harmful pollutants. We do have a reverse osmosis system in our home, but the option we chose has monthly payments, and not everyone can afford luxuries like water filtration systems within their home. Many in our town are also renters, who may not find it feasible to have their own RO system, or are limited to the water fill up station at places like Willie's grocery store, which is dependent on the local water supply as well. I'm ultimately concerned about the future of this community, if we are allowing a major expansion at this scale, and the implications it could have for people down-stream from this operation, or for the people who are connected to the aquafer below this massive expansion, or in the areas which the "fertilizer" is applied. Even in application of the manure to

fields, which in a way is just a bunch of micro-spills, I am concerned about potential for water to run off of the fields, and contaminate area waterways of both surface and groundwater.

I have also heard from one of the smaller time farmers, that Riverview had a manure spill near Pennock, MN, and this was supposedly not reported for a full week. Supposedly there was no environmental contamination indicated from that 2025 spill, but I remain concerned that there could be things unreported, or issues to be had in not having a baseline to compare data to if a spill occurs, or things could be cleaned up before a spill was fully reported, so the scale of a spill could potentially be underreported. This contamination would be difficult to undo or remedy, once it occurs. As I said, I have already heard from friends who fish in the area along the Pomme de Terre water shed, that there were noxious algae blooms in area waterways in the last several years. I am concerned that a project of this size may go up, before we even have baselines of data to compare anything to, to monitor the effects of the expansion over time. I believe we need more accurate data than is currently the standard, in order to protect the environment from the people who are "farming" on it and straining the land for what they view it is worth.

To couple the risk of the pollution of the waterways, with the increase risk of abnormally dry times and increased water demand on local supply that this project would cause, it makes this project expansion seem like it could potentially cause more harm than good. I know that in the last several years, there have been summers filled with Red Flag Warnings, abnormally dry to moderately dry periods of drought, and there has been some cause for concern in the arid climate of the Great Plains steadily creeping eastward, potentially now swallowing Morris up with it. This type of climate shift may be hard to come to terms with, but I think it gives cause for concern that a proposed expansion of this size could get its fingers deep in the watershed, thus jeopardizing the safety and security of the residents and others who call west central MN home. There are more who live out here than the cows "churning" a profit for their investors, but this expansion would ensure there are more cows than people here.

The effect this expansion could have on small family farms is potentially irreversible. I just today saw a news article from MPR news titled, "Agriculture is changing. To protect farmers from stress, mental health support has to change, too," which was written by Tadeo Ruiz Sandoval and Molly Castle Work. This article described the immense stress that small farms have in the face of the current turbulent economy. With the proposed expansion of Riverview's operations in Morris, I fear for the small-time farmers who may "go under" because the influence of flooding the market with this many cows may be "the straw that broke the camel's back" and negatively impact those who gave their testimony at the MPCA public comment meeting at Old No One Southside on April 28th. Riverview wanting to expand from 7,885 to 18,885 cows has small family farms worried about what the future holds for their farm.

With Riverview having so much capital, I wonder also how they have been influencing the housing market in town in Morris. I have seen recently a home was for sale, then swooped quickly off the market, where now a truck with "Riverview" on the side is parked. This could be a good thing on the surface, or could be a more complicated thing at the heart of it. If Riverview is able to purchase properties, they could then rent them to employees, setting terms for rent and making even more profit as an entity. By purchasing homes right when they enter the market, I fear that other people and families in this town may struggle to then become homeowners themselves, due to not being able to put as big of a downpayment on a potential home purchase in comparison to those associated with Riverview. Morris has an abundance of renters, and I wonder how much their ease of access to evolving to the level of homeownership is impacted through this potential pattern in rapid property buy-ups.

And while Riverview may not own all the land which they interact with, I fear they still have the "air of a monopoly" due to the amount of influence they have upon farmland which they contract with; they may

not own all the acres, but in a way they do, by having the ultimate say on what cover crop is planted and what is used to fertilize via their cow-barn liquid excrement. I heard that this liquid manure is tested once a year? Well, I don't think testing this liquid manure once a year is enough, because I imagine there could be some variations over the course of the year which could impact testing results.

One of my acquaintances, her husband works for Riverview tending the cows. They are from Mexico. She said they treat the cows better than their workers at times. They are very strict with timing of operations. My acquaintance is fearful that if the company might have something go wrong, that potentially people will blame the low-level workers, before they find any fault in the owners and investors of the company.

Situations like the overly-packed MPCA meeting are problematic; there were community members who were born and raised in Morris area, who were unable to attend the meeting due to capacity constraints. From comments I have read on local Facebook posts online, people became very frustrated that Hispanic/people of color (who potentially may not be proficient in English or may not have attended the meeting to make a public comment) were there "in their stead", and thus occupying seats where other genuine concerns could have been sitting. Moments like this impact the resiliency of our community, because I believe there could be an increase in racial prejudice and racial stereotyping or profiling, due to someone reporting that they had attempted to speak with the Hispanic members of the audience, and were apparently greeted with "No English". This issue has me feeling frustrated, because my Mexican acquaintance whose husband works for Riverview, said she had wanted to attend the meeting to maybe see more people in the community, and to learn more about the scope of the project and impact it could have; she wants to maybe have a baby of her own, and needs to know if she should invest in a water filter for her home to protect her family, and she voiced concern about how the community may view her, and welcome her (or not) depending on the way this proposed expansion situation unfolds.

This sort of social impact is something that could be better understood, if an EIS were to be conducted. An EAW is small potatoes, compared to the in-depth analysis that this community deserves before this project is pushed through.

There is also the major recent concern, of having so many animals housed in a relatively small areas; given the recent hantavirus sensationalism in the news, I am now worried about what it means for the community in Morris to have so many animals in close quarters. Would an increase in capacity at the facility put the surrounding area at an increased risk of pathogens to spread or mutate in close quarters? What measures are in place to prevent and plan for this biological aspect of the project? Is there adequate confidence that a sufficient plan is in place if something were to go wrong, to prevent us from being a new "Ground Zero"?

I am not voicing that I am for or against this project, but I do have legitimate concerns regarding a project at this scale. It's great if it works, but I worry about what happens if or when it doesn't go according to plan. This is the only home my kids have ever known, and I would appreciate getting a sense of potential impact on the community and our area at large, and maybe even beyond, if this project proposal were to be granted. If this project pollutes the water, or air, or wrecks roads in the area, that is an issue I need to be addressed. How can we mitigate these potential impacts, and what sort of plan is in place, if these impacts are realized in our community, or by those who are downstream? I don't want to focus on potential jobs created by this expansion, or impact on taxes (although my worry for an increased burden on tax-payers is also real), I care most about our fundamental rights to have access to clean water and to retain our freedoms to accessible clean water, and to have ethical land management which considers the community at large, wildlife who doesn't

have a voice to defend itself, and the state of Minnesota as a whole. I'm concerned about how much manure waste a facility of this size would have, what land this waste would be applied to, and how much of a risk there is for runoff to pollute our precious water ways, which could in turn impact local families, local wildlife, and the future of the land in west central MN and beyond, due to the precedent this facility will set. We need a thorough Environmental Impact Statement. The risks to the ecology of the area are too great to not conduct an EIS. How would this sort of precedent established by the project impact the way that other future operations are scaled up?

The only people who were advocating for a "more streamlined, faster" process of these proposals and project fulfillment, were the ones who stood to profit from it. What's to come of the people, who are stuck in the area which they call home, after this area becomes altered in ways they struggle to voice, due to a project which was pushed through too hastily?

I request that an Environmental Impact Statement be completed, to ensure all necessary factors are considered, and controls in place to mitigate the potential risks of this project. I need to be assured that I have an answer that I can depend on, through scientific data and rigorous analysis of all facets of the proposal.

Sam Visser **Letter 1303**

My name is Sam Visser and I am an employee of a family owned excavation company. Riverview has helped our business grow and taught us new ways to achieve our goals. Anytime we are on the farm you can always guarantee two things great attitudes from all the employees and a super clean work environment. So our company never has a problem with going to help them out with what ever is needed.

I feel that Riverview also has a big impact to the surrounding communities. The farmers have an opportunity to sell their crops locally right to the dairy which saves on trucking and on guessing what the markets are going to do. They have apartments in small towns that brings new customers into small businesses. They have even taken on high school students as interns who might be interested in doing something in that career field!

Riverview has brought so much growth and opportunity into our community and we are grateful for that.

Joe Stroman **Letter 1304**

My name is Joe Stroman and I operate my family farm which is located 2 miles from the existing West River Facility. I am the 6th generation to live and work here, and 2026 marks 150 years of family ownership of our farm since it was homesteaded in 1876.

I am very familiar with Riverview's operation. I have family members who work for them. I have toured both their main barn and the West River barn. I've sold silage to them in the past and I've also worked on one of their silage harvesting crews. What people say is true: Their barns are clean and professionally run, and their employees all seem happy to work there.

That being said:

After reviewing the Environmental Assessment Worksheet, I believe there are some issues that need to be addressed.

My first issue of concern is wind erosion due to numerous consecutive corn silage crops. While documentation shows that runoff erosion is minimal, It seems that wind erosion is not being monitored.

In fact, wind erosion isn't mentioned once in the entire EAW document. We have many days throughout the fall, winter and spring where the wind exceeds 30 mph and large amounts of topsoil can be observed blowing off of Riverview's silage fields while adjacent fields remain intact. Corn silage harvest removes at least 90% of above ground biomass, and even if the maximum rate of manure solids are applied afterwards and a cover crop is planted, it doesn't come close to replacing what was removed. Riverview usually grows silage corn for a number of years, followed by a perennial alfalfa crop as a resting period. This is described numerous times in the EAW as a "crop rotation". This is not a crop rotation, it is a decade-long alternation of two cash crops and a cover crop that never exceeds vegetative state. The continuous removal of biomass, followed by intensive tillage, plus a lack of biodiversity from consecutive corn crops results in a loss of soil structure and rapid degradation of the A-horizon. When topsoil blows off of fields it typically collects in road and drainage ditches. Numerous studies have been conducted where blown topsoil has been shown to have very high concentrations of nitrogen, phosphorous and potassium. Wind erosion potential of continuous silage ground and mitigation practices thereof is something that should be required in an Environmental Assessment Worksheet. If not, an Environmental Impact Statement should be required to determine the potential impacts of these practices.

Another concern that I have is the socioeconomic impact of an operation this size, which is not covered in the EAW, and is often ignored in public discourse. While Riverview does provide opportunities to other farmers in the form of buying silage and selling manure, many smaller farm operators within the West River Dairy footprint are of the opinion that Riverview's competitive presence in the local land market has caused a false inflation of land values. If Riverview is interested in a piece of farmland, they will pay top dollar, and landowners are aware of this fact. Most farmland tenants can't compete with Riverview's offers or bids if and when their rented ground comes up for sale, which decreases their acres of production, leading to a loss of opportunity for future generations to step into their family business. This has become very evident in the small communities surrounding Morris, who must work diligently to keep businesses and schools open in spite of a declining population. I am aware that the consolidation of agriculture in this area isn't solely caused by Riverview. However, observing many other rural communities where Riverview doesn't have a presence may lead one to believe that they are a catalyst. An argument could be made that the West River Expansion already has a sufficient land base to operate with, and has no need to buy more land. That very well could be true, under the assumption that there will be no further expansions. Anyone who possesses the gift of hindsight can see how that plays out. In 2003, Riverview held a public meeting to discuss the proposed construction of the original West River Dairy facility, their second barn at the time. My father, Keith Stroman, stood up and asked why they were more than doubling the size of their dairy enterprise with the simple question: "Why are you doing it?" One of the owners responded, "It's for our kids." This was a good enough answer for Keith, as he was structuring his own farm operation so that I could someday step in. Fast forward 23 years, and they've built a dozen more barns just in the state of Minnesota alone. I'm not convinced that this is a one and done project, and I'm also not convinced that this is being done to safeguard job security for someone's kids.

I believe that Riverview has every right to do business in Stevens County, but when the industrial scale of their expansion has the potential to impact an entire community, there needs to be industrial scale accountability.

I've deliberated making this comment since the opening of the comment period, because I feel like it will put a target on my back. I know many other people who won't be making a comment or voicing their opinion because they fear social or professional repercussions. This ties back to the socioeconomic effects that I mentioned above.

In closing, I don't believe the Environmental Assessment Worksheet addresses all of the potential impacts of the proposed expansion, environmental or otherwise. Riverview has the personnel, resources and most of all, ambition to do their due diligence and complete an Environmental Impact Study.

Rick Metzger **Letter 1305**

Dear Commissioner Kessler:

I grew up on a small farm in southwest Minnesota. Prior to joining Riverview, I spent my entire career in agricultural finance working with farm and agribusiness operations of every scale across the United States. I am also a Riverview employee and partner who came to this company because of its culture of opportunity. I want the record to reflect what that actually means: I am a farm kid who did not have a clear path back into production agriculture through my own family. I found that path at Riverview. And now my son is working here too. From the outside, people see a large dairy operation. From the inside, this is a story about what happens when passionate people who love agriculture are given an opportunity to build something together. That is the story this expansion is about.

I have reviewed a substantial amount of the comments submitted on this project and would like the MPCA to take note of something: the support record includes a substantial number of named local and regional businesses, contractors, equipment suppliers, ag lenders, and employers who have written substantively about the economic activity Riverview generates for them and their communities. Supporters also consistently speak to firsthand knowledge of Riverview's environmental stewardship, its nutrient management practices, its commitment to operating above minimum regulatory requirements, and its track record of compliance on this very site. The opposition contains virtually no businesses at all. The people with direct economic experience alongside this operation, and direct observation of how it operates on the ground, appear to overwhelmingly support it.

The MPCA is a science-based regulatory body. I am asking you to hold this comment record to that standard. What follows is my attempt to do the same.

Opposition comments suggest this project is somehow detrimental to Minnesota's farm economy. The record says otherwise. This project comes at a moment when the national dairy industry is signaling extraordinary confidence in future demand: U.S. dairy processors invested a record $11 billion in new processing capacity between 2025 and 2028, per-capita dairy consumption reached a record 661 pounds per person in 2023, U.S. dairy exports continue to grow, and U.S. milk production is projected to grow by 15 billion pounds by 2030. The market is not asking whether dairy should grow. It is asking where. West River Dairy is part of that answer. The demand exists for farms of every scale that choose to meet it.

It is also worth discussing what “large” actually means in today's dairy industry. Virtually every new dairy built in the United States over the past ten years has been constructed at 5,000 to 12,000 cows or larger. West River Dairy's proposed scale is significant by Minnesota standards. By the standards of modern dairy investment nationally, it is competitive and rational.

In my work in agricultural finance, I have heard the same observation consistently from lenders, peer groups, and industry professionals across the country: Riverview is frequently cited as a model for people development, operational management, animal welfare, and environmental stewardship. Their facilities are among the most sought-after in the United States for industry tours. I share that not to advocate for the company that employs me, but because that external, unsolicited recognition from professionals who evaluate dairy operations for a living is relevant context for this permit decision. The existing West River Dairy site has operated at this location for years with a strong compliance record.

This permit is not for an untested proposal. It is an expansion of something the record shows already works.

On environmental matters: first and foremost, managed manure application is not a threat. It is a tool. Under a nutrient management plan with soil testing, calculated application rates, and state oversight, it is agronomically sound practice that improves soil health, builds organic matter, and reduces dependence on synthetic inputs. Minnesota farmers have used manure as a fertility resource for generations, and the agricultural community broadly understands its value when managed properly. The permit conditions governing this operation require exactly that level of management. The concerns raised about runoff deserve to be evaluated against the actual permit requirements, not against a worst-case scenario untethered from how regulated operations work.

On the trajectory of agriculture broadly: tractors are larger and more capable. Genetics are more productive. Milking is automated and more frequent. These are not threats to agriculture. They are the result of American innovation, and they are the same forces that made Minnesota dairy competitive globally.

On water specifically: some opposition comments argue that Minnesota cow numbers have declined while simultaneously arguing that this operation uses too much water. Those two positions are in direct tension. If Minnesota still had the same total cow population distributed across thousands of smaller farms, system-wide water consumption would be comparable or higher. Consolidated operations are measurably more efficient on a per-cow and per-unit-of-output basis. That is not an assertion. It is an engineering and agronomic reality that the permit record supports.

The Environmental Assessment Worksheet for this project has been completed. An individual feedlot permit with specific, enforceable conditions will govern this operation. The categories of concern raised in opposition comments, water quality, manure management, stormwater design, and watershed protection, are all addressed within the existing regulatory framework. No commenter has identified a specific material question that the EAW failed to address and that only an EIS could answer.

One comment suggested that Riverview's resistance to an EIS implies something negative to find. That is an inversion of how permitting works in a system that must presume compliance with applicable laws, unless evidence suggests otherwise. The question is whether the existing process has left specific material questions unanswered. It has not. And the standard is whether there is the potential for significant environmental effects. There is not.

Applying a never-before-used standard to this operation would also send a signal to every agricultural investor considering Minnesota: that regulatory certainty here is conditional, and that scale alone is sufficient grounds for extraordinary review regardless of designs, plans, applicable regulations, and compliance record. That signal would have consequences well beyond this permit decision.

There is something worth saying plainly at the close of this letter. Rural Minnesota is not dying because of farms like this one. Farms like West River Dairy are among the reasons rural Minnesota's future is bright. They bring jobs and families and economic activity that ripples outward through every business and institution in the region. They give farm kids another place to build a life in the communities they grew up in.

The factual record supports this permit. The EAW has been completed. The permit process is sufficient. The economic case is documented. The environmental concerns raised in public comments are addressed within the existing regulatory framework, and no specific gap has been identified that would require an EIS to fill.

I recognize that many people who submitted comments have genuine concerns about their community and their environment. Those concerns are valid and deserve a rigorous process. That process exists and has been followed here. What the concerns do not warrant is a heightened standard that the record does not justify.

I respectfully ask the MPCA to issue this permit. The existing review process is sufficient. An EIS is not warranted. This project, and the people whose futures depend on it, deserve the opportunity to move forward.

Respectfully submitted,
Rick

Jeff Beckman **Letter 1306**

It concerns me that when we concentrate this many animal units in a single area that there is the potential for issues. While I understand their ability to handle these farms, It's important to remember that when we concentrate the farms, we lose small farms, and when we lose small farms we lose communities. If this project is allowed to move forward, I believe it will affect our rural areas in a way that will not be seen for years. Therefore, it is important to fully understand the effects on the loss of other dairy's in the state that this project would be replacing.

I believe when we look at all the facts and exam the options there are other ways that the good of all people can be achieved. Understanding that we need to consider the water and the waste issues, it is important to study it in more depth. Thank you for considering this and requiring a more in depth study.

Erica Boyum **Letter 1307**

Dear Commissioner Kessler:

I am writing in strong support of the proposed West River Dairy Expansion in Synnes Township, Stevens County, and to respectfully urge the MPCA Commissioner to issue a negative declaration on the need for an Environmental Impact Statement. Both my husband and I grew up on dairy farms in Minnesota. We are passionate about agriculture, passionate about dairy, and passionate about building sustainable opportunities and livelihoods for generations to come. We are raising our family here, living right on the Pomme de Terre River, and we have found our personal and professional home with Riverview. I am the fourth generation in my family to work in dairy, and it is my sincere hope to pass that opportunity on to my children. Riverview has made that possible — and this expansion is part of that same story. Farming sustainably and responsibly is not an abstract value to me; it is a daily commitment. I truly believe that Riverview cares for people, animals, and the environment in the best way possible, and the record before the MPCA reflects that. The Environmental Assessment Worksheet is thorough, the permit structure is adequate, and an EIS is not warranted.

Peter Louwagie **Letter 1308**

Living my entire life in the dairy industry i have seen tremendous growth in farm size and we are getting to the point of industrialization not farming. At the proposed size of this dairy I believe there are many things that could result in a disaster along the line of the large dairy in Texas suffering a fire on killed the majority of the cows and had a effect on the national milk supply. There is many possibilities of biosecurity going wrong with the scope of an operation this size and causing a disruption of the short shelf life of diary products.

Concentrating this size of operation in one location i believe is not good for the people of Minnesota. A strong viable dairy industry is i believe very important to this state.

As the industry farm operations increase to industrial size maybe the state legislature has to consider in spending public dollars on research and promotion a worth while invastment

Alisha Livengood **Letter 1309**

My name is Alisha Livengood. I have lived in Morris for 33 years. I graduated high school here and continue to live here as we raise our family. Riverview continuously invests in our community, provides opportunity and growth, and holds strong values. I support the West River Dairy expansion. No EIS is needed as Riverview has already provided information required to move forward with an expansion. Thank you for your time and consideration.

Alisha Livengood

Rebecca Pedersen **Letter 1310**

There is more than just the environment at issue here. The dairy cattle live heart-breaking lives in these factory farms. If MN can save beagles from a neighboring state, I think we can try to help the cattle here...along with our environment. We know that weather and ethical issues often cross state lines and impact lives at great distances from our State. Thank you for requesting we pause and give more thought to all of the issues involved. You are correct, our water, climate and communities are counting on us...as well as the animals with whom we share our lives on a daily basis. What world do we want our children inherit from us? What care and concern and compassion are we modeling for them?

Willis Mattison, Izaak Walton League of America **Letter 1311**

Dear Mr. Peterson,

Thank you and the Minnesota Pollution Control Agency staff for inviting comments on the draft West River Dairy Expansion Environmental Assessment Worksheet (EAW) and for holding a public meeting in Morris, Minnesota on April 28th.

Based on the history of past Riverview projects and confined animal feeding operations (CAFOs) in general, our review of the draft EAW for this exceedingly large expansion and the applicable criteria we have concluded that an environmental impact statement (EIS) is warranted. We find the draft EAW itself deficient in a lot of ways, but we do not call for its revision. Instead, the information we do find in the draft EAW is more than sufficient justification for moving forward into a full EIS.

Our comments in support of that conclusion are grouped according to the four specific criteria shown in Minnesota Rules 4410.1700, subpart 7. The MPCA, as the Responsible Governmental Unit (RGU) must consider these criteria when determining if a project has the potential for significant environmental effects and therefore warrants an Environmental Impact Statement (EIS):

1. Type, extent, and reversibility of environmental effects;
2. Cumulative potential effects;
3. Degree of mitigation by ongoing public regulatory authority, and;
4. Anticipation and control of effects from other studies.

Below is our summary outline with our comment topics listed as lettered subheadings under each of the four criteria. Following this summary is a more detailed discussion on each topic.

Comment Summary as Outline of Topics Covered

Criterion 1 - Type, extent, and reversibility of environmental effects -

A. EAW vastly under sizes the environmentally relevant area (ERA)
B. EAW fails to acknowledge that polluted groundwater may not be reversible
C. Effects on ground and surface water quantities and flows don't add up;
D. Potential ground water contamination by leachate from manure pits and basins is not quantified
E. Contamination by manure seepage to perimeter tile draining shallow groundwater from under manure pits delivered to storm water basin is unaccounted for
F. A report in EAW minimizes future low flow probability in Pomme de Terre River and is misleading and inconsistent with climate trends stated elsewhere
G. Crop land used for manure spreading may need containment to avoid runoff reaching surface waters
H. The EAW fails to identify potential increases in antibiotic resistance and/or the potential zoonotic infections effects of large CAFOs.

Criterion 2 - Cumulative potential effects

A. Deliberate under sizing the environmentally relevant area cannot be used to avoid impact overlap and claim impacts are not cumulative
B. EAW does not properly characterize past, present and future environmental conditions of the environmentally relevant area
C. EAW fails to account for impacts of feedlots in the impacted areas whether owned or operated by proposer or not.
D. EAW minimizes or ignores proposed project incremental contribution to cumulative potential effects
E. EAW describes purposeful avoidance of potential mitigation offered by "green infrastructure" as part of intentional project design
F. EAW fails to identify impaired waters as evidence of past and present projects

Criterion 3 - Degree of mitigation by ongoing public regulatory authority

A. The EPA has found MPCA's existing feedlot rules and permits to be inadequate
B. MPCA will not have strengthened feedlot rules in time to control this project
C. Local ordinances and county feedlot officers are ineffective
D. Federal Clean Water Act authority remains delegated to the state MPCA
E. MPCA may be in violation of MEPA which prohibits permitting polluting activity when less polluting alternatives exist
F. MPCA fails to extend its authority over pollution caused by manure delivered to other farmers and landowners
G. MPCA has failed to adopt nitrate standards for surface and groundwaters.

Criterion 4 - Anticipation and control of effects from other studies

No other EIS has been prepared on a feedlot of this size in the project area or similar setting
B. Compliance with TMDL goals for areas surface waters are not acknowledged
C. Other studies have found large feedlots degrade local economies and community health
D. Economic impacts are not included in EAWs but can be addressed in an EIS

Detailed Discussion of Each Topic

Criterion 1 - Type, extent, and reversibility of environmental effects – The RGU must examine the nature of the impacts, how widespread they are, and whether they can be undone.

A. EAW vastly under sizes the environmentally relevant area (ERA).

The EAW claims the area impacted by the project can be limited to the exact area of the feedlot site, the areas where manure will be spread and a one-mile radius around the off-site wells.

> *"The Environmentally Relevant Area (ERA) for the Project has been delineated to ensure that environmental effects from other projects do not overlap. The ERA is defined as the oversized Project Boundary, all idenƟfied manure applicaƟon fields designated for the Project and ExisƟng Facility, and a one-mile radius surrounding the off-site water-supply well (Attachment 20).*

This claim cannot be supported. Project impacted air, water and soils move freely across these property boundaries and are carried far beyond them, down rivers into aquifers that move and across neighboring properties and into other counties. Climate impacts are global in scale. Surface water impacts are regional and can exceed the bounds of the Pomme de Terre watershed into the Minnesota River. Therefore, the impacts of this exceeding large feedlot project on this larger more realistic and environmentally relevant scale are potentially significant and justify an EIS.

B. EAW fails to acknowledge that polluted groundwater may not be reversible

The potential for manure storage area leakage and field applied manure seepage below the crop root zone into groundwater is likely under the many thousands of acres proposed for this project. Despite the project's inclusion of extra thick clay liners under the manure storage pits, these liners can still be expected to leak up to 100 gallons per acre per day (one fifth of the allowable leakage rate). Manure application (along with commercial fertilizer) to farm fields has been shown to create the potential for seepage into groundwater even when applied at agronomic rates. Agronomic application rates are not designed to prevent excess nutrients or other farm chemicals from reaching groundwater, instead they are designed to maximize production with the least amount of application.

Once contaminated, groundwaters are extremely difficult if not impossible to clean. Drinking water sourced from groundwater may be treated to remove some contaminants but this is not a reversal of the original contamination.

C. Effects on ground and surface water quantities and flows don't add up

The expansion would use 287.5 million gallons per year, almost as much as the city of Morris, population 5,100. The project relies on two well water fields, one on site and one off site that are limited in available supply, either by impact on low river flows or excessive drawdown of aquifer levels. A back up storm and well water storage pond is planned to serve as a temporary water supply in when well extraction limits kick in. No calculations are supplied in the EAW to assure the backup will suffice during extended drought periods lasting several months if not years. An EIS will be required to estimate the probability and frequency at which the project operators may request emergency exemption from well pumping limits to keep their livestock alive. Depopulating such an enormous feedlot in a time of drought is impractical. Such an exemption places other well users and the river at risk for serious water shortages. This alone is a potential for significant impact warranting an EIS to evaluate available alternatives including the no-action alternative.

D. Potential ground water contamination by leachate from manure pits and basins is not quantified

At the public meeting in Morris on April 28th of this year, MPCA officials admitted that manure pit leakage, even at the reduced rates afforded by thicker clay liners, would likely reach groundwater. The MPCA dismissed these impacts as not being significant because "receptors" of this contamination (understood to be private or public wells) were far enough away. These estimates are subject to internal

speculation and discussion with the project proposer but have not been made public. The basis for these estimates and the factors contributing to estimate uncertainties should be presented in an EIS and thus subjected to third party scrutiny.

E. Contamination by manure seepage to perimeter tile draining shallow groundwater from under manure pits delivered to storm water basin is unaccounted for

The draft EAW states:

> "To control potenial seasonal subsurface saturaion near the LMSAs, a drain-tile system will be installed around the perimeter of the LMSAs at an elevaion below the LMSA liners. The clean seasonal subsurface water from the perimeter tile system will drain into a nearby stormwater basin, where it combines with Project stormwater.

MPCA acknowledges and allows (permits) manure storage ponds to leak and this leachate is most certain to find its way into the perimeter drain-tile system. The project should not be designed to dispose of manure contaminated seepage in this tile system in a stormwater system. The stormwater system is oversized but still can be predicted to need discharge during wetter years. The EAW form fails to address the need for wastewater treatment in section 12.B.1. C as follows:

> "12.B.1.c. If the wastewater discharge is to surface water, identify the wastewater treatment methods and identify discharge points and proposed effluent limitations to mitigate impacts. Discuss any effects to surface or groundwater from wastewater discharges, taking into consideration how current Minnesota climate trends and anticipated climate change in the general location of the project may influence the effects."

The RGU's entry here is that this treatment requirement is "Not Applicable" which is interpreted to mean no wastewater discharge is planned. An EIS would need to resolve this contradiction/omission and either describe total containment of contaminated manure pit leachate which would seem impractical or the proposed treatment of this wastewater, possibly by land irrigation or other means.

F. A report in EAW minimizes future low flow probability in Pomme de Terre River and is misleading and inconsistent with climate trends stated elsewhere

> "Riverview LLP requested Moore Engineering Inc. (Moore) to evaluate discharge flows from Pomme de Terre River (River) in Appleton, MN. Moore assessed historic data from USGS Gage #05294000 to determine the percentage of time the flow in the River was less than three specified flow parameters. Historically, the trend of the Rivers minimum discharge has increased. This is most evident after 1991, as can be seen on Figure 1. Between 1931 and 1991, average minimum flow was approximately 8.5 cfs. After 1991, the average minimum flow increased to 50 cfs.

In the climate impacts section of the EAW, river flows are predicted to continue decreasing as average temperatures increase. These inconsistencies are confusing to the public and should be clarified in an EIS.

G. Crop land used for manure spreading may need containment to avoid runoff reaching surface waters:

The EAW states:

> "Increased precipitation may cause the loss of some acres of cropland due to saturation of low spots within fields or localized flooding after rain events. New drainage or water impoundment systems may need to be developed by landowners to handle increased volumes of stormwater

in fields. If these structures are built on any of the manure application fields, they would take land out of crop production to convert to water management structures. With a contingency of over 3,000 additional manure application acres beyond what is needed each year, there is abundant operational flexibility if some portions of the fields are no longer available due to weather condition impacts.

This is a very important revelation that has potential for significant future effects that are a direct result of this project. If 3,000 acres of prospective manure application fields have known drainage issues that will not be identified and remedied until after some future rain events this should be a red flag. Rainstorms that are increasing in frequency and severity due to climate change and cause localized flooding should not be relied upon as the trigger for corrective action. Surface or groundwater pollution is likely to have already happened. Simply eliminating these areas from future manure application after the drainage problem has been experienced will not prevent this pollution. Here, the EAW can serve its true function and trigger an EIS that can explore this issue more thoroughly and evaluate alternatives that would avoid predictable pollution.

H. The EAW fails to identify potential increases in antibiotic resistance and/or zoonotic infections effects of large CAFOs.

A report in 2020 by the Natural Resources Defense Council[1] (NRDC), reveals that US cattle producers use more than 40% of all medically important antibiotics—those that are also used in human medicine—sold for use in US livestock, and use them three to six times more intensively than many of their European counterparts.

NRDC says this overuse of antibiotics is a strategy used by the beef industry to offset heightened disease risks in feedlots, where cattle are routinely fed antibiotics to prevent disease whether or not they are ill, a practice that the World Health Organization discourages and that the European Union will no longer allow starting in 2022. The reports also argues that there is little transparency or accountability in the beef industry regarding its use of medically important antibiotics, and little urgency to rectify the problem.

"Many infectious disease and antibiotic resistance experts believe such use is improper and helps contribute to reservoirs of drug-resistant bacteria on farms that can spread easily to humans through consumption of meat, exposure to soil or water contaminated with manure containing antibiotic-resistant pathogens or contact with animals. They also worry that it reduces the effectiveness of antibiotics that are needed to fight infections in people."

A 2023 report in the Journal of Dairy Science[2] states:

"Antibiotics are used in the dairy industry mainly to treat mastitis, respiratory illness, lameness, and enteric diseases (Andrews, 2000; Dodd and Booth, 2000; Alliance to Save Our Antibiotics, 2016). Some of the antibiotics used are particularly important in treating human infections; therefore, their continued use in dairy cattle is predicted to have dangerous implications for human and animal health (Alliance to Save Our Antibiotics, 2016). One of the main uses of antibiotics in dairy cattle is "dry cow" treatment, which involves a long-acting intramammary antibiotic infusion given to cows between lactation cycles, with the intention of treating existing infections and preventing new infections (Dodd and Booth, 2000). Blanket dry cow therapy (BDCT) involves the prophylactic

[1] **Report slams beef industry for overuse of antibiotics** - Chris Dall | News Reporter | CIDRAP News June 26, 2020 Antimicrobial Stewardship

[2] Factors influencing dairy farmers' antibiotic use: An application of the COM-B model - Journal of Dairy Science Volume 106, Issue 6, June 2023, Pages 4059-4071

antibiotic treatment of every cow at drying off to prevent infection; BDCT has historically has been used in mastitis control (Biggs, 2017). As this involves giving antibiotics to all cows, even those who are not infected at drying off, BDCT has been linked to the threat of AMR development (Brunton et al., 2012; Higham et al., 2018).

With regard to zoonotic infection risks on large dairy farms, a 2017 article by Michigan State University[3] states that:

"People that work with dairy cattle can be at risk of becoming infected with a zoonotic disease. However, families of employees and people in close contact with dairy personnel can be at risk too. The compliance of preventive measures protects not only people in direct contact with animals, but also people in their homes. Prevention is especially important if there are children under 5 years old, elderly or people with weak immune systems in the families of the dairy personnel, since they can get sick more easily and could have more severe symptoms of the disease.

Contracting a zoonotic disease not only has consequences on the health and wellbeing of the person affected, it also impacts the normal operation of a dairy farm. In times when the work force is very limited, producers cannot afford to have a valuable worker off the farm due to a preventable disease."

Because these issues are highly complex, were not addressed at all in the EAW and because research has shown the overuse of antibiotics and failure to employ proper and consistent biological safeguards in feedlots can present significant threats to human health that may not be reversable, an EIS is warranted to fully inform the public and inform the permitting of an industrial scale livestock facilities like the one proposed.

Criterion 2 – Cumulative potential effects – The RGU must consider whether the project's impact is significant when added to other past, present, and reasonably foreseeable future projects, including those by other entities.

A. Deliberate under sizing the environmentally relevant area cannot be used to avoid impact overlap and then claim impacts are not cumulative

As was previously referenced above the EAW states:

"The Environmentally Relevant Area (ERA) for the Project has been delineated to ensure that environmental effects from other projects do not overlap. The ERA is defined as the oversized Project Boundary, all identified manure application fields designated for the Project and Existing Facility, and a one-mile radius surrounding the off-site water-supply well (Attachment 20). **The established ERA for the Project avoids cumulative potential effects** (CPE) as detailed in Item 21." (bold added for emphasis).

This is a conspicuous but unacceptable attempt to avoid having to disclose effects that are most certainly cumulative. The project is not proposed for a pristine, isolated island, it will be situated in an already degraded environment, part of which is caused by the existing feedlot that is being expanded. And degradation by the landscape having been converted to agriculture is evidence of past effects. If the air and water in the vicinity are not clean and the native ecosystems are not fully functioning, this project's impacts must be added to these "past and present" actions and then added to the impacts of reasonably foreseeable actions. The incremental degradation attributable to this project is certainly greater than most but it cannot escape its cumulative significance by simply declaring it does "overlap"

[3] **Prevent Zoonotic Diseases on your Dairy Farm -** Paola Bacigalupo Sanguesa, Michigan State University Extension - November 29, 2017

with other "projects. These cumulative effects should be more honestly and accurately assessed by preparing an EIS.

B. EAW does not properly characterize past, present and future environmental conditions of the environmentally relevant area

The existing dairy and other farming operations are near the Pomme de Terre River, which flows into the Minnesota River. State testing has found E. coli in the Pomme de Terre watershed, as well as nutrients that can lead to algae blooms. Already, several sections of the river do not support aquatic life or human recreation. The river starts out clean but gets more and more polluted as it passes through farmland. TMDLs have been prepared to document the problems directly associated with animal agriculture in several streams and wetlands in the vicinity and the remedial measure needed to restore them to the fishable and swimmable condition required by law. A fair determination of the cumulative effects of this project requires the effects of all past, present and future projects be accurately characterized so this project's impacts can be added to them. An EIS is the appropriate tool for correcting this oversight in the EAW and informing the MPCA and the public as to whether a permit can be issued.

C. EAW fails to account for impacts of feedlots in the potentially affected areas whether owned or operated by proposer or not.

As stated in our comments above, Riverview owns and operates numerous other large feedlots, many of which in the same watershed as the proposed expansion. And other smaller feedlots not owned by Riverview are identified in maps included in the EAW. These feedlots are also in the same watershed and potentially are affecting the same wetlands, groundwater, habitat and air quality. Quantifying and accounting for the collective impacts of these existing livestock operations is usually beyond the scope and purpose a of an EAW. The EAW must identify and locate these feedlots but does not need to quantify their impacts. This is an appropriate function of an EIS.

D. EAW minimizes or ignores proposed project incremental contribution to cumulative potential effects

By declaring the environmentally affected area of the project so narrowly, as described above, the proposer attempts to side-step the need to acknowledge the incremental addition of the project to the effects of its own operations and those like it in the vicinity. This error should be corrected and the incremental impacts quantified in an EIS.

E. EAW describes purposeful avoidance of potential mitigation offered by "green infrastructure" as part of intentional project design

The EAW states:

> "The Project is not proposing to incorporate typical green infrastructure or planting trees at or around the Project site due to the negative effects they bring to the dairy cows. Common green infrastructure includes landscaping features such as trees, shrubs, and standing water that attract insects. In turn, this attracts birds and/or other animals. The United States Department of Agriculture (USDA) recommends incorporating enhanced biosecurity features into new dairy operations to avoid unwanted diseases. West River Dairy Expansion measures included designing the facility to minimize livestock exposure to birds and further prevent disease transmission, such as Highly Pathogenic Avian Influenza."

Landscaping with trees, shrubs, pollinator friendly plants near constructed ponds could provide aesthetic mitigation for the adverse effects of the enormous built infrastructure proposed in this project while providing a modicum of natural habitat for birds, insects and many other forms of important

wildlife. As described above, this entire region has had its wildlife populations of all kinds, decimated by loss of these types of habitats. While this biosecurity practice may be recommended by the USDA, alternatives to these environmentally harmful biosecurity measures should be evaluated with an EIS.

F. EAW fails to identify impaired waters and loss of biodiversity as evidence of past and present projects

The writers of the EAW miss an opportunity to utilize comments from other agencies to document how past projects have degraded several aspects of the environment in the vicinity of this project.

The DNR letters and emails attached to the EAW identified several areas with high potential for restoration very near the project and recommended the project include plans to implement designs to prevent surface runoff or invasive species from damaging these areas:

> "The Minnesota Biological Survey (MBS) considered several areas very near the proposed project for Sites of Biodiversity Significance that did not meet the minimum biodiversity threshold for statewide significance. Despite being Below the statewide threshold, these areas may have conservation value at the local level as habitat for native plants and animals, corridors for animal movements, buffers surrounding higher quality natural areas, or as areas with high potential for restoration of native habitat. **As such, indirect impacts from surface runoff or the spread of invasive species should be considered during project design and implementation.**

The project, as presently designed, does not specify any special designs or alternative measures intended to effectively avoid these impacts. This is an appropriate function of the EIS and underscores the need for that higher level of review that we support.

And the DNR identified several areas of high biological significance near the project largely due to bird populations, but mollusks and plant species were also mentioned:

> Ecologically Significant Areas • Three lakes near the proposed project area have been identified as Lakes of High Biological Significance. These are Gorder Lake, Clear Lake, and an unnamed lake in T124N R43W Section 13. Lakes of Biological Significance were ranked as Outstanding, High, or Moderate based on unique plant and animal presence. These lakes received their rank largely due to their bird populations.
>
> Elktoe (Alasmidonta marginata), a state-listed threatened mussel; Small white lady's-slipper (Cypripedium candidum) and prairie mimosa (Desmanthus illinoensis), both state-listed plant species of special concern
>
> • To benefit all of the above rare species and features, we recommend that manure application rates and timing be carefully determined to ensure that nutrient input does not exceed the ability for crop nutrient uptake on the fields where it is applied.
>
> The Environmental Assessment Worksheet should address whether the proposed project has the potential to adversely affect the above rare features and, if so, it should identify specific measures that will be taken to avoid or minimize disturbance. Sufficient information should be provided so the DNR can determine whether a takings permit will be needed for any of the above protected species."

Here the DNR recommends the EAW establish whether the proposed project has potential to affect these species but it does not. While buffers are shown around manure application fields near wetlands and water courses no analysis is provided to assure these buffers are sufficient to avoid or minimize the effects the DNR is concerned about. An EIS should be prepared to answer the question the DNR poses in

order to inform the Department whether a takings permit will be needed. The EAW did not and likely could not provide this level of analysis.

The EAW reveals specific water body impairments near the project that included Lake Hattie had a nutrients TMDL plan approved in 2015 and the Pomme de Terre River identified turbidity (2002) and fecal coliform (1994) impairments. Muddy Creek has excessive E. Coli (2020) while Dry Wood Creek has listed impairments for dissolved oxygen (2012) benthic macroinvertebrates bioassessments (2012) Turbidity (2010) E. Coli (2010) with TMDL plans approved for all impairments in 2015.

The proposed project can be predicted to exacerbate these impairments given the EPA's finding that the state's feedlot rules are ineffective for protecting water quality (see item 3-A below). These impairments are, as evidenced by the TMDL plans prepared for them, significant and in need of reduced loading primarily from improper handling of livestock wastes in their respective watersheds. An EIS is necessary to explore alternative methods for land application of livestock wastes from this facility as part of the remedial actions called for in the TMDLs

Criterion 3 - Degree of mitigation by ongoing public regulatory authority – The RGU evaluates if existing, specific regulatory permits or processes can effectively mitigate the environmental impacts.

A. The EPA has found MPCA's existing feedlot rules and permits to be inadequate

The Minnesota Division of the Izaak Walton League of America on the advice of the Prairie Woods Chapter in Detroit Lakes joined with the MCEA, Trout Unlimited and the Minnesota Well Owners Organization (MnWOO) and others in signing a petition to the U.S. Environmental Protection Agency (EPA) that successfully convinced the EPA that the MPCA's current rules and permit requirements for feedlots were inadequate to protect water quality and the human environment as required by the Federal Clean Water Act. The EPA instructed the MPCA to revise or amend their rules and write more effective permits. While the MPCA is in the process of making these improvements, the proposed project is subject to the very same existing rules the EPA found inadequate.

The petition to EPA did focus on karst and sand plain regions of Southeaster and Central Minnesota but similar alluvial sands exist in the areas in and around Stevens County where manure application fields have been identified for this project.

While this fourth criterion is primarily intended to require identification of regulatory authority in place that could mitigate potential environmental impacts it can also function to identify shortcomings of existing regulations. That is precisely the situation we have here. There is no more compelling argument for ordering an EIS on this and any other large feedlot proposed in Minnesota than this finding by the highest environmental authority in the nation, the U.S. Environmental Protection Agency.

B. MPCA will not have strengthened feedlot rules in time to control this project

As stated in item 3-A above, the MPCA's rules and permit requirements for feedlots are in the process of being improved to satisfy the EPA and the public that they will adequately protect water quality. However, those improvements have not yet been made. Yet the MPCA has proceeded to draft an EAW and a prospective permit for this project under these decidedly inadequate rules.

In a footnote to a table showing depths to groundwater under the projects manure application fields the EAW states:

> **The Proposer has agreements with landowners for manure application covering over 16,500 acres. Depth to groundwater will vary throughout these acres.* ***There are no rules prohibiting manure application onto high water table soils.*** *The Proposer uses and exceeds BMPs for manure application and follows all state rules and local ordinances. (bolding added for emphasis)*

This declaration (in bold) by the project proposer demonstrates how feedlot operators can take advantage of the agency's overly lax feedlot rules to apply manure where shallow water tables are vulnerable.

The MPCA's moving this project forward to this point may be required by laws intended to streamline the permitting process. But by ordering an EIS on this and any other feedlot seeking a permit in the interim, the MPCA has the choice of forestalling inadequately designed feedlots from being constructed and operated until more adequate rules are in place. While not the intended purpose of the document, an EIS can serve as an effective guide in crafting rules and permit conditions that meet the EPA's requirements and fulfil the goals of the Clean Water Act. This in effect, would declare a moratorium on large feedlot permits until such time as the rules are deemed adequate to protect the state's water quality.

We request the MPCA respond to this proposition by exploring their own and possibly the Environmental Quality Board's statutes and rules to assure the Agency has the authority and willingness to temporarily hold permits in abeyance for this purpose.

C. Local ordinances and county feedlot officers are ineffective

Here again, we apply this criterion to demonstrate the lack of regulatory authority at the local county or township level to mitigate identified environmental effects not otherwise addressed by state or federal rules. The Izaak Walton League's experience in Becker County and other rural counties has demonstrated local governments reluctance to effectively control water pollution from feedlots through local land use ordinances. In fact, these counties defer to the MPCA on these matters insisting that they control land use conflicts through ordinances, but they do not and will not control water pollution from these activities.

D. Federal Clean Water Act authority remains delegated to the state MPCA

While the EPA did find the MPCA feedlot rules inadequate the federal agency has not revoked the state's authority to continue issuing permits under the existing rules while the state's feedlot rules are undergoing amendments. Thus, citizens cannot depend on the federal government to prevent feedlot pollution.

E. MPCA may be in violation of MEPA which prohibits permitting polluting activity when less polluting alternatives exist

Minnesota Statutes 116D.04 (the Minnesota Environmental Policy Act or MEPA) in Subdivision 6 – Prohibitions states:

> *"No state action significantly affecting the quality of the environment shall be allowed, nor shall any permit for natural resources management and development be granted, where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state, so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare and the state's paramount concern for the protection of its air, water, land and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct."*

Given that the EPA has officially notified the MPCA, the petitioners and the public (including Riverview Farms that the agency's feedlot rules are inadequate to protect water quality it is likely that if the agency does proceed to issue a permit for the project it will, in this federal agency's opinion, cause the pollution, impairment or destruction expressly prohibited by this section of MEPA when and if the project is constructed and operated as planned.

We agree with the EPA and also believe that this project will cause or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state and that feasible and prudent alternatives to the issuance of this permitting action by the state exist including the no action (no permit) alternative. And, as MEPA states; any economic hardship such permit denial may inflict on permit applicants shall not be used to justify issuance of a permit for this or other similar projects.

Should the MPCA choose to issue this, or other large animal feedlot permits before it has properly amended its feedlot rules, we assert that such state agency action would be in violation of this prohibition section of MEPA.

In its response to these comments, we request the MPCA address this assertion and explain to us and the public why they should be considered in violation of MEPA in this situation.

F. MPCA fails to extend its authority over pollution caused by manure delivered to other farmers and landowners

MPCA feedlot permit writers and enforcement staff admit they have not attempted to extend permit conditions for land application of manure to secondary users. This means these secondary users have been knowingly allowed complete immune from compliance with the permittees manure management plan. This is an obvious failing of the MPCA's current feedlot rules and permits or the agency's enforcement policy.

The MPCA should not issue feedlot permits or approve manure management plans that allow this loophole that has significant potential for adverse effects on water quality. An EIS may be useful for exploring the jurisdictional options and authority the MPCA has or may need to close this loophole.

G. MPCA has failed to adopt nitrate standards for surface and groundwaters.

The Minnesota legislature granted the MPCA the authority and resources to develop nitrate standards to protect aquatic life uses for the state's surface waters and regulate non-fertilizer sources of nitrates (primarily manure) from large feedlots decades ago but the agency has not completed the necessary rulemaking to implement this authority.

An EIS for this project that calculates nitrate loading to area surface waters (and groundwater) from the project may help underscore the urgency for the agency and the Minnesota Department of Agriculture to complete the rulemaking in effective way to control manure borne nitrates from polluting both surface and groundwaters.

Criterion 4 - Anticipation and control of effects from other studies - The RGU considers if the effects can already be managed through other available environmental studies or previous EISs conducted for the project or area

A. No other EIS has been prepared on a feedlot of this size in the project area or similar setting

This is an important fact and should be considered support for preparing an EIS for this project. The food industry in general has avoided formal environmental scrutiny by local, state or federal governments. Scientific studies of this industry's impacts are widely available in literature, and the impacts are myriad and widespread. We believe the MPCA is capable of a thorough literature search for these studies to corroborate this assertion. But, to assist the agency we've attached a report prepared by the Prairie

Woods Chapter of the Izaak Walton League of America for Becker County's planned update of its comprehensive land use plan as it was dealing with a proposed CAFO in 2024. The report cites a number of environmental impacts identified by scientific studies.

The MPCA would be well justified in selecting this, the largest ever proposed CAFO in the state for the very first EIS.

B. Compliance with TMDL goals for areas surface waters are not acknowledged

C. Other studies have found large feedlots degrade local economies and community health

The following is taken from the abstract of Kelley J. Donham, et al article entitled: "*Community Health and Socioeconomic Issues Surrounding Concentrated Animal Feeding Operations*"[4].

A consensus of the Workgroup on Community and Socioeconomic Issues was that improving and sustaining healthy rural communities depends on integrating socioeconomic development and environmental protection. In workshop sessions the following recommendations were developed:

"Workshop Recommendations

Priority research needs.

Community health studies. *Although sufficient research supports actions to protect rural residents from the negative impacts of CAFOs on community health, additional research could be conducted to further delineate mechanisms of effects and impacts on susceptible subgroups. These areas include psychophysiologic impacts of malodor; impacts of malodor on mental health and quality of life; and respiratory impacts of bioaerosol mixtures, especially among asthmatics, children, and the elderly. Wider and more effective application of community-based participatory research will be important to advance research in these areas.*

Sustainability of livestock production.
Federal funding for agricultural research should be reoriented to promote innovation in sustainable livestock production.

Translation of science to policy.
Requirements for issuing permits for CAFOs should include increased protections for health and the environment including the following:

- **CAFOs should be sited and issued permits on the basis of total animal density allowed in a given watershed as determined by the carrying capacity.**
- **Environmental impact statements should be mandated for all new CAFOs. These should include environmental health, social justice, and socioeconomic issues.**
- **Decisions to issue permits for CAFOs should be considered in public meeting and decided at the local level.**
- **CAFOs should be regulated using standards applied to general industry based on the level of emissions and type of waste handling.**
- **Permits for manure storage basins should require bonding for performance and remediation.**
- **The current state of knowledge of community impacts of CAFOs warrants support for the American Public Health Association recommendation for a moratorium on all new CAFO construction."**

D. Economic impacts are not included in EAWs but can be addressed in an EIS

Dr. John Ikerd, who holds a PhD in Agricultural Economics, now retired from University of Missouri-Columbia, in a Freshwater Futures May 15, 2024, webinar presentation entitled "Economic Fallacies of CAFOs", presented the following conclusions from multiple studies:

- **2008 Review: Reams of research dating to the 1940's show local economies suffer economically and socially from industrial agriculture;**
- **2001 Study: Many CAFO counties are forced to raise taxes to offset increased costs of repairs to rural roads and bridges;**
- **2008 Study: Lower income, greater income inequality, more poverty, less active "Main Street", fewer stores, and less retail trade in CAFO counties;**
- **2015 Study: Property values up to 7 miles from CAFO lowered by 3.1% to 26%; properties next to CAFOs down 88%;**
- **2022 Study: Personal incomes dropped 8% from 1982 to 2017 in Iowa counties with most CAFOs. Other rural counties rose 41%**

Dr. Ikerd, in his own paper entitled: Economic Realities of CAFOs[5] draws the same conclusions and more. He includes an extensive list of reference publications that support his findings. Below are some excerpts from that paper on rural community impacts:

> *"Defenders claim that regardless of the need for CAFOs to meet the needs of consumers, CAFOs are necessary for the economic survival of many farming communities. They point specifically to community economic benefits from local investments in CAFOs, local sales of animals and animal products, and local employment in CAFOs and related local industries. However, decades of socioeconomic research and actual experience in CAFO communities reveal something very different. Whatever CAFOs contribute to local tax bases is more than offset by increased costs of maintaining rural roads and bridges that were not built to accommodate the heavy truck traffic associated with CAFOs. Also, local CAFOs operators typically source construction materials and labor from outside their local communities. Feeder animals, feed, and other supplies are shipped in from elsewhere. Even animal health care is typically provided by corporate veterinarians. Few of the economic benefits from CAFOs remain in local communities.*
>
> *The most frequent claim for community benefits is probably that CAFOs will increase local employment, which is sorely needed in many farming communities. However, the economic reality is that CAFOs employ far fewer people per dollar invested or unit of production than do the independent family farms they inevitably displace. The first research I personally did on this subject was an evaluation of CAFOs as a rural economic development strategy. I evaluated the employment implications of PSF's planned operation in north Missouri. My conclusion was that if PSF came into Missouri, their CAFOs would displace up to three independent Missouri hog farmers for every job they created.[26] CAFOs came to Missouri, and Missouri lost more than 90% of its independent hog producers. I doubt that the number of workers employed in CAFOs in Missouri exceeds more than one-third of the independent hog farmers they displaced. In the case of CAFOs, once livestock and*

[5] "Economic Reality of CAFOs and Rural Communities" - Dr. John Ikerd - University of Missouri - Prepared in May 2020 for discussion at screenings of the CAFO documentary film, Right to Harm, and other uses.

poultry production became specialized, previously diversified family farms became specialized producers of either livestock or crops.

Livestock and poultry were major sources of farm income that had made many diversified family farms economically viable. So, farmers who specialized in grain production were forced to farm more acres of land than before to maintain adequate family incomes. Larger crop and livestock operations meant fewer economic opportunities for farmers. With the industrialization of agriculture, the percentage of the U.S. labor force employed in agriculture dropped from 4.4% in 1970 to less than 1.5% in recent years. Even in the communities where they locate, CAFOs do not actually create jobs. They simply relocate and concentrate fewer lower-paying jobs in CAFO communities than had previously existed on family farms elsewhere.

In addition, this loss of farm families cannot be offset by people moving into rural communities from elsewhere. No one really wants to move to a CAFO community. A 2015 study reviewed thousands of assessed property values for residences located up to 7 miles distant from CAFOs. The review concluded: "Overall, the new studies confirm the [negative] valuation impacts reported in earlier studies, as they range from 3.1% to 26% losses depending on multiple factors, and that properties immediately abutting an AO [CAFO] can be diminished as much as 88%."

It takes people, not just production, to support rural communities. It takes people not only to buy farm supplies and equipment but also to shop on Main Street for cars, clothes, shoes, and haircuts. It takes people to send their kids to local schools, to attend local churches, and to serve on volunteer fire departments and local town councils. When independent family farmers are displaced by CAFOs, it's not just a matter of losing employment; it's a matter of losing the essence of what it takes to be a viable rural community."

After detailing our specific comments on the EAW above, it is important that we make some broader statements here about the deficiencies of Minnesota's environmental review process itself. The worksheets used to make preliminary determination on the potential significance of a project's environmental effects have evolved to be so focused on categorical details as to miss the big picture. The public who reads these lengthy EAWs gets lost in minute details and is never informed of the devastating, incrementally small but cumulatively significant destructions of nature that humans have committed.

The ecological setting for this massive, multifaceted food (milk) industry enterprise is one that has, over many decades, been incrementally degraded to such an impoverished level that the beneficial functions (services) original ecosystems once provided have been all but obliterated. These are the very services nature delivers for free that are essential for all life forms including humans. Pure clear air, clean and plentiful water, fish and wildlife once abounded here. Remnants of the tall grass prairie and wetland complex ecosystems that existed prior to its near total conversion to agriculture (dotted by small human communities) remain only in small insignificant patches here and there. This EAW hints at what the area used to be and in subtle ways justifies the projects contribution to the ecological destruction by explaining that the land is now only used for agriculture and therefore there is little measurable impact on the parts which remain in their "natural" state. That is to say that if natural attributes of our property have already been destroyed, our project's further contribution to that destruction can only be described as minimal or insignificant. Our proposed use is consistent with current land use. We find phrases like this used frequently in this and many other EAWs.

If the setting, the natural backdrop of this project was to be fairly described, it would have to disclose the plummeting populations of insects, birds, fish, reptiles, amphibians, fish and macroinvertebrates. It would have to describe soils that are no longer thriving ecosystems teeming with microscopic life forms

important to healthy crops or native prairie. This is known science but this and other EAWs avoid mention of it. Thus, the public largely remains unaware of the apocalyptic declines and a projects likely role in continued declines. Only when a species for which we have some measure of its population trend (which is few) reaches a near extinction level to we call attention to in in EAWs and that is because it is required by law. There is no requirement to acknowledge mass declines on most all other wildlife and plant populations that are rapidly nearing extinction.

It was astonishing but revealing that the project proposer (who we all understand is allowed to draft the EAW) claims that natural vegetation (trees and shrubs) that might provide habitat for birds on or around the area used for confinement buildings would have to be removed in order to prevent the potential for viral infections transmitted by some birds to reach their livestock. When mere vestiges of nature are pronounced a threat to a human enterprise and sanctioned in a government document such an EAW, there is something seriously wrong with the process. It no longer serves the serves the spirit or intent of Minnesota's Environmental Policy Act that authorizes the document.

This is a substantive comment on all EAWs in general, but also on this one in particular. So, we request that the MPCA respond to it in its record of decision.
